# INTERNATIONAL CONFERENCE ON EURASIAN ECONOMIES 2014

## Skopje - Macedonia
### 1-3 July 2014

# FOREWORD

The International Conference of Eurasian Economies, organized by Beykent University in cooperation with SS. Cyril Methodius University, was held on July 1-3, 2014 in Skopje, Macedonia. Interest from academicians, researchers and foundations in participating in the series has also increased this year with the fifth anual conference. The rate of participants to also attending subsequent conferences reachead 90% and that has especially brought a new dimention to the conference. It is clear that the series is headed in the right direction with the required seriousness and organized in the right cities. Moreover, the number of professors and associate professors reaching 60% of the total participants indicates that the conference series is also academically in demand. We would like to extend our endless gratitude to those who helped establish this image.

The papers presented at the conference span a wide variety of topics and issues that are important the the region: Research on the economies of the countries within this region, integration of Eurasian economies into the world economy, globalization and its effects on the Eurasian economies, Eurasian economic growth and development strategies, international trade, financial markets, public policy and tourism, energy, natural resources, acriculture, entrepreneurship and environmental issues. Because of new problems and demands that materialized due to the nature of the global economy in recent years, papers relating to the affects of law on economic decisions were also evaluated.

This year's International Conference of Eurasian Economies received 318 abstracts and 197 full papers from 20 different countries. Some abstracts were rejected due to their out of scope topics. This year, each paper was evaluated independently by two reviewers and at the end of this process 155 papers were found to be appropriate for presentation at the conference. According to the conference rules, papers that are not presented will not published in the proceedings. Therefore, in this book you will find 150 papers that were presented at the conference. In this context, we would like to thank the distinguished members of the advisory board and the scientific committee for their dedication to and effort in evaluating the submissions.

We are grateful to the Turkish International Cooperation and Development Agency (TIKA) and to the governors and experts of the Central Bank of Turkey for their continued support in organizing this conference. We also want to thank the Board of Trustees and the administrative personnel of Beykent University.

We are very thankful particularly to the valuable dean, Prof. Dr. Ljubomir Drakluevski, and staff of our conference partner, Ss.Cyril Methodius University, for their very important contributions in making the organization flawless.

We are indebted to the contributions of Dr. Alp Gencer's meticulousness in the organization of the conference, from beginning to end. We are very grateful for his and the organization committee's hard work and dedication. Of course our greatest thanks go to all of the academicians, researchers and participants who have shown interest in the conference series.

We are looking forward to meeting you in another Eurasian country at the International Conference on Eurasian Economies 2015.

**Prof. Dr. Selahattin Sarı**
Conference Chair

# ÖNSÖZ

Beykent Üniversitesi ve SS.Cyril Methodius Üniversitesi'nin birlikte düzenlediği Uluslararası Avrasya Ekonomileri Konferansı, 1-3 Temmuz 2014 tarihlerinde Üsküp-Makedonya'da gerçekleştiril-miştir. Beşincisi gerçekleştirilen konferansa, akademisyen, araştırmacı ve kurumların katılım hususunda olan yoğun talepleri bu sene de artan oranda devam etmiştir. Özellikle konferansa ilk defa katılanların daha sonrakilere katılım oranlarının %90'lara ulaşması konferansı farklı bir boyuta getirmiştir. Anlaşıldığı kadarıyla konferans doğru yönde, gereken ciddiyette ve doğru yerlerde organize edilmektedir. Ayrıca konferansa katılanlar arasında sayısal olarak Profesörlerin ve Doçentlerin oranının %60'lara ulaşması bilimsel anlamda da katılımın tercih edildiği bir konferans organizasyonu gerçeğini göstermektedir. Bu tablonun yaratılmasını sağlayan tüm iştirakçilere sonsuz teşekkürlerimizi sunuyoruz.

Konferansta sunulan bildirilerin başlıkları geniş bir çeşitliliğe sahip ve bölge açısından önem taşıyan konularda toplanmaktadır: Bölge kapsamında bulunan ülkelerin ekonomilerine yönelik çalışmalar, Avrasya ekonomilerinin dünya ekonomisine entegrasyonu, küreselleşme ve Avrasya ekonomileri üzerine etkileri, Avrasya ekonomileri için iktisadi büyüme ve kalkınma stratejileri, uluslararası ticaret, finans piyasaları, kamu politikaları ve turizm, enerji, tabii kaynaklar, tarım, girişimcilik ve çevre gibi sektörlerin sorunlarından oluşmaktadır. Son yıllarda küresel ekonominin doğası gereği ortaya çıkan problemler ve talep üzerine, ekonomik kararları etkileyen boyutuyla hukukla ilgili bildiriler de değerlendirmeye alınmıştır.

Bu seneki Uluslararası Avrasya Ekonomileri Konferansı'na, 20 ülkeden 318 özet ve 197 tam metin bildiri gelmiştir. Özetlerin bir kısmı alan uyuşmazlığı vs. nedenlerle elenmiştir. Bildiri değerlendirme aşamasında ise, bu sene uygulanan çift hakem değerlendirmesi, yazarların düzeltme ve format değişikliklerindeki eksiklikleri vs. gibi nedenlerle 155 bildiri sunuma uygun bulunmuştur. Konferans kuralları gereği sunulmayan bildiriler kitaba konmamaktadır. Dolayısıyla bu kitapta konferansta sunulmuş olan 150 çalışmanın tam metnini bulacaksınız. Bu bağlamda, danışma kurulunun ve bilim kurulunun değerli üyelerine çalışmaların değerlendirilmesinde gösterdikleri özveri ve verdikleri emek için teşekkürlerimizi sunuyoruz.

Türkiye Cumhuriyeti Merkez Bankası Başkanı, yöneticileri ve uzmanlarına konferansa gösterdikleri ilgi, konferansın sponsorluğu ve hazırlanma aşamasında değerli desteklerinin devamı için teşekkürlerimizi sunuyoruz. Türkiye İşbirliği ve Kalkınma İdaresi Başkanlığı (TİKA) üye ve bürokratlarına verdikleri sponsorluk desteği için teşekkür ediyoruz. Konferansın düzenlenmesinde ve yürütülmesinde her türlü desteği veren başta Beykent Üniversitesi Mütevelli Heyetine, Beykent Üniversitesi Rektörü ve Genel Sekreterine, idari personele katkılarından dolayı teşekkür ediyoruz.

Konferansın kusursuz gerçekleşmesinde çok önemli katkıları olan konferans ortağı olan, Ss.Cyril Methodius Üniversitesinin başta değerli Dekanı Prof. Dr. Ljubomir Drakulevski olmak üzere, yardımcıları ve personellerine teşekkür ediyoruz.

Konferansın gerçekleştirilmesinde; Dr. Alp Gencer'in başından sonuna titiz çalışmalarının katkısını unutmamız mümkün değil. Kendisine ve organizasyon komitesinin tüm üyelerine yoğun çalışmaları ve katkıları için teşekkür ediyoruz. Elbette ki en büyük teşekkürümüz, bugüne kadar konferansa ilgi gösteren akademisyen, araştırmacı ve katılımcılaradır.

Konferansta sunulan değerli bildiri ve çalışmaların bilim dünyası ve Avrasya ülkelerine katkı sağlaması dileğiyle, Uluslararası Avrasya Ekonomileri Konferansı 2015 için bir başka Avrasya ülkesinde buluşmak dileğiyle.

# Current Account Fragilities in the Balkan Countries

Prof. Dr. Ercan Uygur (Turkish Economic Association, Turkey)

## Abstract

The basic aim of this paper is to make an evaluation of the current account deficits in the Balkan countries. Particularly, sustainability of these deficits is explored for some countries on the basis of a criterion that makes use of variables including foreign debt ratio, growth rate, exchange rate, foreign interest rate and foreign trade balance ratio. Countries with significant current account deficit/GDP ratios include, in descending order, Albania, Bosnia Herzegovina, Turkey, Serbia and Macedonia. Sources of financing of the current account deficits, real exchange rates and inflation are other variables that are considered in the evaluations.

*The author has requested the full paper not to be published in the conference proceedings.*

# Avrupa Birliği'nin Balkanlara Genişlemesi: Balkan Ülkelerine Üyelik Perspektifi

# EU Enlargement to the Balkans: Membership Perspective to the Balkan Countries

Prof. Dr. S. Rıdvan Karluk (Anadolu University, Turkey)

## Abstract

After the dispersion of the Soviet Union, the European Union embarked upon an intense relationship with the Central and Eastern European Countries. The transition into capital market and democratization of these countries had been supported by the Ministers of Foreign Affairs at the beginning of 1989 before the collapse of the Soviet Union System. The European Agreements were signed between the EU and Hungary, Poland, and Czechoslovakia on December 16th, 1991. 10 Central and Eastern Europe Countries became the members of the EU on May 1st, 2004. With the accession of Bulgaria and Romania into the EU on January 1st, 2007, the number of the EU member countries reached up to 27, and finally extending to 28 with the membership of Croatia to the EU on July 1st, 2013. Removing the Western Balkan States, Serbia, Montenegro, Albania, and Bosnia and Herzegovina from the scope of external relations, the EU included these countries in the enlargement process in 2005.The European Commission has determined 2014 enlargement policy priorities as dealing with the fundamentals on preferential basis. In this context, the developments in the Balkans will be closely monitored within the scope of a new approach giving priority to the superiority of law. The enlargement process of the EU towards the Balkans and whether or not the Western Balkan States will join the Union will be analyzed.

## 1 Giriş

2014 yılı Balkanlar için önemlidir. Çünkü 1 Mayıs 2004 tarihinde sekizi eski Doğu Blok'undan, ikisi Balkanlardan on ülkenin AB üyesi olması ve AB'nin 15 üyeden 25 üyeye genişlediği Doğu Genişlemesinin *(Eastern Enlargement)* ya da "büyük patlamanın" *(Big Bang Enlargement)* onuncu yılıdır. Komisyon Tarafından Avrupa Parlamentosu'na ve Konsey'e Sunulan Genişleme Stratejisi ve Başlıca Zorluklar Raporu'nda AB, Batı Balkanların geleceğinin AB'de olduğunu onaylayan 2003 Selanik Zirvesi ile tutarlı bir biçimde Batı Balkanlara yönelik politikasının kapsayıcılığını açıklamıştır (Stratulat, 2013).

Komisyon, Hırvatistan'ın katılımı Balkanlarda bir bölünme hattı oluşturmaktan çok bölgenin geri kalanının AB'ye katılım yolunda daha hızlı ilerlemesi için bir teşvik ve katalizör işlevi gördüğü görüşündedir. AB'nin taahhüdü, bölgenin tarih ve coğrafyası kapsamında gerekli şartlar yerine getirildiğinde Batı Balkanların tümü, Türkiye'den önce AB üyesi olabilecektir. (Özsöz, 2013). Türkiye Cumhuriyeti Ekonomi Bakanı Nihat Zeybekçi Türkiye'nin hiçbir ülkede örneği görülmemiş bir şekilde 53 yıldır ısrarla bu sürece devam ettiğini, (Karluk, 2013) gerekirse bu süreci 53 yıl daha sürdürmesi gerektiği görüşü bu kapsamda gerçekçi değildir (Wimmel, 2006).

Avrupa Komisyonu, 2014 yılı genişleme politikasını, temel konuların öncelikle ele alınması *(fundamentals first)* olarak belirlemiştir. Bu kapsamda hukukun üstünlüğüne öncelik veren yeni yaklaşım kapsamında Balkanlardaki gelişmeleri yakından izleyecek, AB'nin Balkanlara genişleme sürecini teşvik edecektir. Bütünleşmenin ve genişlemenin derinleşmesi birbirine bağlıdır ve AB'nin geleceğinin nasıl olması gerektiği ele alınmadan genişleme politikasının geleceği belirlenemez. Yeni üye ülkelerin AB ile değerler ve ilkeler temelinde bütünleşebilmesi için genişleme politikalarının yanı sıra AB içerisinde gerekli siyasi ve kurumsal çerçevenin oluşturulması gerekmektedir. Üye ülkelerin farklı ihtiyaçlarına cevap oluşturabilecek esnek ve çok katmanlı AB'nin oluşturulmasına ihtiyaç duyulmaktadır.

## 2 Avrupa Anlaşmaları ile Avrupa Komşuluk Politikası, Karadeniz Sinerjisi ve Avrupa Birliği Doğu Ortaklığı Arasındaki Farklar

Avrupa Anlaşmalarının amacı bu ülkelerin AT'ye tam üye olmasını sağlamaktır. (EC, COM (94)361) Bunun için en fazla 10 yıllık süre içinde *(geçiş dönemi)* ticaretteki gümrük vergileri ve diğer kısıtlayıcı önlemler Merkezi ve Doğu Avrupa *(MDA)* ülkelerince kaldırılacaktır (Karluk, 2007). Avrupa Anlaşmaları Avrupa Birliği'nin Avrupa Komşuluk Politikasından *(European Neighbour Policy: ENP)* farklıdır. Avrupa Komşuluk Politikası AB'nin aday statüsünde olmayan yakın komşuları 16 ülkeyi kapsamaktadır. Bu ülkeler şunlardır: İsrail, Ürdün, Moldovya, Fas, Tunus, Filistin, Ukrayna, Ermenistan, Azerbaycan, Mısır, Gürcistan, Lübnan, Cezayir, Suriye, Libya ve Beyaz Rusya (Karluk, 2014).

MDA ülkeleri ile Ortaklık Anlaşmaları imzalanmakta, daha sonra bu anlaşmalar kapsamında Eylem Planları hazırlanmaktadır. (EU, White Paper, 1995) Komşuluk Politikası, komşu ülkelerin AB genişlemesinden istikrar, güvenlik ve refah açısından faydalanmalarını öngörmektedir. Bu amaç 2003 yılında onaylanmış olan Avrupa

Güvenlik Stratejisi'nde de vurgulanmıştır. 12 Aralık 2003 tarihinde Avrupa Güvenlik Stratejisi Belgesi'nde belirtilen stratejik amaçlar, Avrupa Komşuluk Politikasının temellerini oluşturmaktadır. Mart 2003'te Komisyon tarafından Daha Geniş Avrupa-Güney ve Doğu Komşularıyla İlişkiler İçin Yeni Bir Çerçeve hazırlanmış, 12 Mayıs 2004 tarihinde ise Avrupa Komşuluk Politikası Strateji Belgesi yayımlamıştır. Bu belge ile AB, komşusu olarak nitelendirdiği ülkeler ile nasıl daha yakın ilişkiler kurabileceğini ortaya koymuştur (Verhofstadt, 2005).

Avrupa Komşuluk Politikasının amacı, beşinci genişleme dalgasının ardından AB'nin yeni komşularıyla ilişkilerinin derinleştirilmesi ve Avrupa kıtasını bölen sınır çizgilerinin oluşmasını engellemektedir. Komşuluk Politikası bu sebeple yeni bir genişleme hedefi ile değil, yeni komşular arasındaki bağların güçlendirilmesi amacıyla oluşturulmuştur (Kratochvil, 2006). Avrupa Birliği Avrupa Komşuluk Politikası kapsamında önceki Barselona Süreci'nin *(Barcelona Process)* yerine geçen Avrupa Akdeniz Ortaklığı *(Euro-Mediterranean Partnership: EUROMED)*, Doğu Ortaklığı ve Karadeniz Sinerjisi *(Black Sea Synergy)* ülkeleri ile yakın ilişkilerini sürdürmektedir (Wodka, 2010).

Karadeniz Sinerjisi Avrupa Birliği'nin Karadeniz havzasında işbirliği içinde olduğu 8 ülkeyi kapsamaktadır. Bu ülkeler; Türkiye, Bulgaristan, Ermenistan, Gürcistan, Moldova, Romanya, Ukrayna ve Yunanistan'dır. Sinerji Programı kapsamında Avrupa Birliği bütçesinden sağlanan yardım Türkiye için IPA *(Katılım Öncesi Yardım Aracı)* fonlarıyla temin edilirken, diğer 7 ülke için ENPI *(Avrupa Komşuluk Politikası Aracı)* aracılığıyla aktarılmaktadır.

AB ile Karadeniz Sinerjisi kapsamındaki ülkelerin Dışişleri Bakanları 2008 yılında Kiev'de yaptıkları toplantıda aldıkları karar ile Sinerjiyi başlatmışlardır. Ülkeler bu kapsamda demokratik ekonomik reformları gerçekleştirecekler, ekonomik istikrar ve kalkınmayı destekleyecekler, tüm ülkeleri ilgilendiren projeleri teşvik edecekler, bölgedeki anlaşmazlıkların barışçıl yollarla çözümü için çaba harcayacaklardır. Sinerji, Karadeniz bölgesinde yer alan ülkelerde daha güçlü ve sürdürülebilir kalkınmayla daha güçlü bölgesel işbirliği ve ortaklık sağlamayı amaçlamaktadır. Avrupa Birliği Konseyi 2008 Haziran ayında AB ile doğu komşuları arasındaki ilişkilerin güçlendirilmesi ve Avrupa Komşuluk Politikası kapsamında bu ülkelere yönelik özel bir strateji geliştirilmesi amacıyla Avrupa Komisyonu'ndan Doğu Ortaklığı için çalışma yapmasını istemiştir.

Komisyon tarafından hazırlanarak 3 Aralık 2008'de Konsey ve Parlamento'ya sunulan Doğu Ortaklığı *(Eastern Partnership: EaP)* başlıklı bildiri *(COM 2008, 823 final)* AB Konseyi tarafından 19-20 Mart 2009 tarihli Zirve'de onaylanmıştır. Avrupa Birliği Doğu Ortaklığı Stratejisi, 7 Mayıs 2009 tarihinde AB ortak ülkeler liderlerini bir araya getiren Doğu Ortaklığı Zirvesi ile başlatılmıştır. Polonya Dışişleri Bakanı Radoslaw Sikorski'nin önerisi ve İsveç'in desteğiyle 26 Mayıs 2008 tarihinde Brüksel'deki Genel İşler ve Dış İlişkiler Konseyi'nde gündeme gelmiştir.

Ortaklığın ilk zirvesi 7 Mayıs 2009 tarihinde Prag'da yapılmıştır. İkinci Zirve 29-30 Eylül 2011 tarihlerinde Varşova'da Ermenistan, Azerbaycan, Gürcistan, Moldova ve Ukrayna'nın kalımıyla gerçekleşmiştir. Doğu Ortaklığı çerçevesinde Dışişleri Bakanlarının ilk toplantısı 8 Aralık 2009 tarihinde Brüksel'de yapılmıştır. Bu toplantıda Beyaz Rusya hariç tüm ülkelerle 2010 yılında ortaklık anlaşmaları müzakerelerine başlanılması kararlaştırılmıştır. Avrupa Birliği, Avrupa Komşuluk ve Ortaklık Aracı kapsamında Doğu Ortaklığı için mevcut Komşuluk Politikası kapsamında 2010-2013 dönemi için özellikle üç girişimi desteklemek amacıyla 350 milyon ek kaynak tahsisi ile 6 ülkeye ayırdığı mali kaynağı 1.9 milyar Euro'ya çıkarmıştır.

Doğu Ortaklığı Stratejisi Azerbaycan, Beyaz Rusya, Ermenistan, Gürcistan, Moldova ve Ukrayna ile iletişimi derinleştirmeyi, bu ülkelerde istikrar ve refahı desteklemeyi, taraflar arasında işbirliği ve ortak tutumu güçlendirmeyi amaçlamaktadır. Böylece, Avrupa Komşuluk Politikasının doğu ayağının geliştirilip, Doğu Avrupa ve Güney Kafkaslara genişletilmesiyle, Akdeniz İçin Birlik ve Transatlantik İşbirliği politikalarıyla dengelenmesi hedeflenmektedir. Böylece taraflar arasında siyasal, sosyal ve ekonomik alanlarda standartların AB'ye yakınlaştırılarak karşılıklı etkileşim, ticaret ve refahın artırılması hedef olarak alınmıştır. Strateji, yeni ortaklık anlaşmaları akdedilmesini, AB ile ülkeler arasında daha ileri bir ekonomik entegrasyon yaratılmasını, kişilerin serbest dolaşımının kademeli olarak arttırılarak kültürel etkileşimin güçlendirilmesini, AB ile ortak ülkeler arasında enerji alanında işbirliğinin derinleştirilmesini, ortak ülkelerde bölgesel farklılıkların azaltılması için ekonomik ve sosyal politikaların desteklenmesini kapsamaktadır.

Doğu Ortaklığı ile bu ülkelere yönelik fonlar iki katına çıkarılarak eski Sovyet Cumhuriyetlerinin politik ve ekonomik reformları gerçekleştirmeleri desteklenmektedir. (Rozoff, 2009) Bu ülkeler için gümrüksüz ticaret ve vizesiz seyahat öngörülmektedir. İşbirliğini derinleştirmek için Dışişleri Bakanlarının yıllık toplantılarda bir araya gelmeleri ve her iki yılda bir zirve toplantısının yapılması planlanmıştır. Ortak ülkeler ile AB arasında imzalanacak yeni Ortaklık Anlaşmaları, taraflar arasında daha ileri ekonomik entegrasyon kurmak amacıyla derin ve kapsamlı serbest ticaret anlaşmaları oluşturulmasını hedeflemektedir. Ortak ülkeler Dünya Ticaret Kuruluşu üyesi olduktan sonra onlarla imzalanacak anlaşmalar, enerji dahil bütün ticaret alanlarını kapsayarak ticaretle ilgili alanlardaki düzenlemelerde AB ile yakınlaştırma sağlayacaktır.

AB, ortak ülkeler vatandaşlarının AB'ye seyahatinin kolaylaştırılması için karşılıklı düzenlemeler yapmayı planlamaktadır. Bu kapsamda, yasadığı göçü önlemek, ortak ülkelerde iltica ve sınır yönetim sistemlerinin AB standartlarına yükseltilmesi ile yolsuzluk ve organize suçla mücadele gibi konularda ortak ülkelerde kolluk

güçleri ve yargı kapasitesinin artırılmasını içeren Seyahat ve Güvenlik anlaşmalarının gerçekleştirilmesi öngörülmektedir.

Konsey, Litvanya, Letonya ve Estonya ile müzakere edilen Avrupa Anlaşmalarını 1997 yılı sonunda sonuçlandırmıştır. 12 Haziran 1995 tarihinde imzalanan ve 1 Şubat 1998 tarihinde yürürlüğe giren bu Anlaşmalar, önceden 15 AB üyesi devletin ve üç Baltık ülkesinin ulusal parlamentoları ile Avrupa Parlamentosu tarafından onaylanmış idi. AB ve Baltık ülkeleri, Avrupa Anlaşmalarının siyasi diyalog ve yapısallaştırılmış diyalog bölümlerini geçici olarak uygulamışlardır. Ekonomik ve ticari ilişkiler ise, 1994'de sonuçlandırılarak 1 Ocak 1995'de yürürlüğe girmiş olan Serbest Ticaret Anlaşmaları çerçevesinde yürütülmüş idi.

MDA ülkelerindeki reform sürecine yardım amacıyla bu ülkelerde siyasi istikrarın kurulmasını hedeflenmiştir (EU, 1994. Bulletin of the EU). Bu ülkelerin demokrasiyi benimsemiş olmaları, kendilerine komşu olan AB'yi çok yakından ilgilendirmektedir. Çünkü demokrasi ile idare edilen ülkeler her zaman diktatörlük ile yönetilen ülkelere göre daha güvenli komşulardır (Sarkozy, 2007). Demokrasinin MDA ülkelerince benimsenmesi, AB'nin ve tüm Avrupa'nın güvenliği için çok önemlidir. AB'nin, bu ülkelerde meydana gelebilecek sosyo-ekonomik kargaşanın önüne geçebilecek politikalar üretmesi gerekmektedir. Gelir dağılımındaki çarpıklıklar sebebiyle Doğu Avrupa'dan Batı'ya işgücü göçü yaşanması mümkündür. Bu durum, AB ile MDA ülkeleri arasına yeni bir duvarın inşa edilmesine yol açabilir (Ledge, 1994).

MDA ülkeleri ile imzalanan Avrupa Anlaşmalarında, AB'ye tam üyeliği düzenleyen herhangi bir hükme yer verilmemiş, tam üyelikle ilgili düzenlemeler Avrupa Anlaşmaları sonrasında yapılmıştır. Avrupa Anlaşmalarının imzalanmasından sonra, 1993 Haziran ayındaki Kopenhang Zirvesi'nde AB, MDA ülkeleri ile olan ilişkilerine yeni bir boyut kazandırılmıştır. Alınan karar uyarınca MDA ülkeleri belirli şartları sağlayarak AB'ye üye olabileceklerdir (Laursen, 1995). Kopenhag Zirvesi'nde alınan kararla bu ülkelerin üyelikleri, akit tarafların ortak hedefi olmuştur. Üyeliğin ön şartı niteliğinde olan ve sağlanması gereken kriterler belirlenmiş, fakat üyeliklerin gerçekleşmesiyle ilgili bir tarih öngörülmemiştir. Kopenhag Zirvesi'nden sonra 31 Mart 1994'de Macaristan, 5 Nisan 1994'de Polonya, (The Telegraph, 2008) 22 Haziran 1995'de Romanya, 27 Haziran 1995'de Slovakya, 27 Ekim 1995'de Letonya, 27 Kasım 1995'de Estonya, 12 Aralık 1995'de Litvanya, 16 Aralık 1995'de Bulgaristan, 17 Ocak 1996'da Çek Cumhuriyeti (EU, 2014. Conference on 10 years of the Czech membership in the EU) ve 10 Haziran 1996'da Slovenya AB'ye üyelik için başvurmuştur.

1994 yılında MDA ülkelerinin üyelik başvurularının başlamasıyla birlikte, 9-10 Aralık 1994'de Essen'de toplanan AB Zirvesi'nde Korfu Zirvesi kararları doğrultusunda aday ülkeler için Avrupa Birliği'ne Katılım Öncesi Strateji *(pre-accession strategy)* belirlenmiştir. Bu Strateji, Avrupa Anlaşmalarına taraf olan aday ülkelerle düzenli ve planlı siyasi ilişkiler kurarak bir güven ortamı yaratmayı hedeflemektedir. Burada amaç, aday ülkelerin AB'nin Tek Pazar uygulamasına uyumlarının sağlanmasıdır (Kavalalı, 2006).

Essen Zirvesi Kararları'nda yer alan Katılım Öncesi Strateji üç temele dayanmaktadır. İç Pazara Hazırlık: Ortak ülkeler, AB'ye üye olmaları durumunda AT iç pazarının da parçası olacaklardır. Ortak Ülkelerde Sürdürülen Reformların PHARE Programı Kapsamında Desteklenmesi: PHARE Programı çerçevesinde ortak ülkelere sağlanan yardımların en önemli işlevi, ortak ülkelerin Topluluk mevzuatına uyumu ve üyelik hedefi doğrultusunda ortak ülkelerin pazarlarının hazırlanması olacaktır. Yapısal Diyalog: AB'ye üye ülkeler ile ortak MDA ülkeleri her düzeyde bir araya getirecek bir yapısal diyalog oluşturması öngörülmüştür. Aralık 1999'da MDA ülkeleri, Mart 2000'de Güney Kıbrıs Rum Yönetimi (Kıbrıs) ve Malta, Mart 2001'de Türkiye ile Katılım Ortaklığı *(accession partnership)* kabul edilmiştir. Bu ülkeler, AB mevzuatını benimseyen Ulusal Programlarını açıklayarak katılım önceliklerini belirlemektedir. 2001 yılında tüm ülkeler Ulusal Programlarını güncelleştirmişlerdir.

## 3   Balkanlara Son Genişleme: Bulgaristan, Romanya ve Hırvatistan

Balkan ülkelerinden Romanya 22 Haziran 1995, Bulgaristan 16 Aralık 1995 tarihinde AB'ye tam üyelik başvurusunda bulunmuştur. Komisyon diğer 8 MDA ülkesiyle birlikte 16 Temmuz 1997'de olumlu görüşünü açıklamış, her iki ülke ile 15 Şubat 2000'de üyelik müzakerelerine başlanılmıştır. Ekim 2002 Brüksel Zirvesi'nde Komisyon'dan, 2002 yılı Aralık ayında gerçekleştirilmesi öngörülen Kopenhag Zirvesi'ne kadar Bulgaristan ve Romanya'nın kaydetmesi gereken ilerlemeleri içeren bir takvim ve katılım öncesi yardımları da kapsayacak bir yol haritası hazırlaması istenmiştir. Zirve'de ülkelerin 1 Ocak 2007 tarihinde AB'ye üye olma yönündeki çabalarının desteklendiği açıklanmıştır.

Komisyon, 13 Kasım 2002'de Helsinki Grubu aday ülkeleri arasından katılım müzakerelerinde Lüksemburg Grubu ülkelerinin gerisine düşen ve 1 Mayıs 2004 tarihinde gerçekleşmesi öngörülen AB'nin beşinci genişlemesinde yer almayacak olan Romanya ve Bulgaristan için Yol Haritası *(Roadmaps for Bulgaria and Romania)* hazırlamıştır. (COM 2002 624). Belge, Aralık 2002 Kopenhag Zirvesi'nde kabul edilmiştir. Bulgaristan ve Romanya'nın 1 Ocak 2007 tarihinde Avrupa Birliği üyesi olmaları ile birlikte AB'ye üye ülkelerin sayısı 27'ye yükselmiştir.

1 Haziran 2000 tarihli Feira Zirvesi'nde Balkan ülkelerinin AB'ye potansiyel adaylıkları kabul edilmiştir. Yugoslavya'nın dağılmasından sonra AB ile 29 Ekim 2001 tarihinde İstikrar ve Ortaklık Anlaşması

imzalayan Hırvatistan, 21 Şubat 2003'de üyelik için AB'ye başvurmuştur. 1 Ocak 2004 tarihinde Avrupa Komisyonu Hırvatistan'a aday ülke statüsü verilmesini önermiş, Konsey 1 Haziran 2004'te Hırvatistan'ın aday ülke olduğunu açıklamıştır. 1 Şubat 2005 tarihinde İstikrar ve Ortaklık Anlaşması yürürlüğe girmiştir. Üyelik müzakerelerine Türkiye ile birlikte 3 Ekim 2005'te başlayan Hırvatistan'ın müzakere süreci 6 yıl sürmüş ve 1 Temmuz 2013 tarihinde Hırvatistan AB üyesi olmuştur.

## 4   AB'nin Genişleme Strateji Belgeleri ve Esnek Bütünleşme Yaklaşımı Kapsamında Balkanlara Genişleme

Avrupa Birliği 1998 yılında İlerleme Raporları ile Birliğin Genişleme Stratejisini yayınlamaya başlamıştır. 8 Kasım 2006 tarihinde genişlemeye ilişkin 2006 Strateji Belgesi'nde AB'nin mevcut strateji çerçevesinde Birliğin etkin biçimde işlemesi, beşinci genişlemeden dersler çıkartılması, genişlemeye ilişkin sorunların ele alınması, aday ülkelere üyelik sürecinde destek olunması ve genişlemenin devamı için kamuoyunun desteğinin sağlanması ortaya konmuştur (COM, 2006 649 final). Belge'ye göre; mevcut genişleme gündeminde Batı Balkan ülkeleri ve Türkiye bulunmaktadır. Belge'nin Katılım Öncesi Strateji Başlığı altında şu görüşlere yer verilmiştir: Katılım öncesi stratejinin temel unsurları, Katılım Ortaklığı ve Avrupa Ortaklığı'dır. *(European Partnerships)* Bu belgeler, ülkelerin AB üyelik hedefine doğru ilerleme sağlamaları için gereken öncelikleri, Komisyon'un ilerleme raporlarında yer alan bulgular temelinde belirlenmekte ve önceliklerin yerine getirilmesine yönelik verilen AB desteğinin çerçevesini çizmektedir.

Genişleme Strateji Belgesi'nin Genişleme Süreci'ne ilişkin paragrafında bundan sonraki genişleme politikasının üç temel ilkesine dayandığı belirtilmektedir. Bu stratejiye "Üç C" denir: sağlamlaştırma *(consolidation)*, şartlılık *(conditionality)* ve iletişim *(communication.* Birliği sağlamlaştırma kapsamında AB üyesi ülkeler, üye sayısı Bulgaristan ve Romanya'nın katılımıyla 27'ye çıkan Birliğin, yeni üye almadan önce kendi evini temizlemesi gerektiği üzerinde anlaşmışlardır. AB, Türkiye ve Hırvatistan gibi müzakereleri sürdüren ülkeleri kabul etmeden önce kendi işleyişini düzene koyacaktır.

İkinci C politikası olan şartlılık, aday ülkelere yönelik kuralların tam olarak uygulanmasıdır. AB, önce Kıbrıs'ın da içinde olduğu 10 ülkeye, ardından da Romanya ve Bulgaristan'a AB üyeliği için müzakereler devam ederken tarih vermişti. Bu tarihe bağlı kalınması için de aday ülkelerin bazı eksiklikleri görmezden gelinmiş, bu eksikliklerin üyelikten sonra tamamlanabileceği fikriyle hareket edilmişti. Şartları tam olarak yerine getirme kuralı çerçevesinde aday ülkelerin AB'ye katılımı konusunda önceden kesin tarih verilmeyecektir. Aday ülke, tüm şartları yerine getirse bile, AB'nin yeni üyeleri hazmedip hazmedemeyeceğine bakılacaktır. Üçüncü C politikası olan iletişim kapsamında asıl görev, AB üyesi ülkelerin hükümetlerine düşmektedir. AB ülkeleri, bundan sonra aday ülkelerin üyeliği konusunda kendi halklarını hazırlamak için daha fazla çaba harcamayı taahhüt etmektedirler (COM, 2010, 660).

Esnek Bütünleşme Yaklaşımı, *(flexible integration)* bütünleşmenin gerçekleştirilmesi için farklı bir yöntem benimsemektedir. Bu yaklaşıma göre ülkelerin bütünleşme sürecinde bulundukları yerler ya da öngörülen politikaları gerçekleştirme seviyeleri önemini kaybetmektedir. Yaklaşım, AB politikalarını iki gruba ayırmaktadır. İlk grup, her ülke için uyulması zorunlu politikalardan meydana gelmektedir. Bu politikalar AB'nin ortak paydasıdır. İkinci grup ise seçimlik politikalardan oluşmaktadır. Üye ve aday ülkeler bu gruptaki politikalardan istediklerini benimseyerek aralarında serbest işbirliği *(serbest ortaklık)* kurabileceklerdir. Her ülkenin serbest ortaklığa dahil olma zorunluluğu bulunmamaktadır (Pedersen, 1994).

AB'nin 21'nci yüzyıldaki muhtemel yapısı şöyle olacaktır: Tek bir kurumsal çerçevesi olan, farklı ölçülerde bütünleşmiş üyeleri bulunan, üyelikten vazgeçmenin veya geçici olarak çıkartılmanın mümkün olduğu, dört temel dolaşımın *(mallar, hizmetler, kişiler ve sermaye)* serbest olduğu, ortak dış ticaret ve ortak rekabet politikalarının üye olmayan ülkelere de uygulandığı bir sistem. Burada Roma Anlaşması'nın yürürlüğe girdiği 1958'den bu yana gündeme getirilmeyen bir konuyu açıklığa kavuşturmak gerekir. Amsterdam Anlaşması'nın metninde, AB Konseyi'nde insan hakları konusunda ciddi sorunları olan üye ülkelerin oy haklarının *(üyeliklerinin)* geçici olarak nasıl askıya alınabileceği ayrıntılarıyla ortaya konmuştur.

Yeni yapılanmada tek bir kurumsallaşma önem taşıyacaktır. (Straw, 2013).Bu kurumsallaşmada, merkez çekirdek içinde olan üye ülkeler diğer üye ülkelerden önce bazı hedeflere ulaşmak için ortak kurumları kullanabileceklerdir. (Kourvetaris and Moschonas, 1996) Merkez çekirdek içinde olmayan üye ülkeler de, ortak kurumların kullanılmasına izin vereceklerdir. Fakat Schengen Anlaşması'nda olduğu gibi Kurucu Anlaşmalar çerçevesi dışında bir merkez çekirdek oluşmasına izin verilmeyecektir. Esnek bütünleşme ile de AB, hızı ve hedefleri üye ülkelere göre değişiklik gösteren bir bütünleşme anlayışı geçerli olacaktır. (Ledge, 1994) Birbiri içine geçen halkalar Avrupa'sında merkez halkanın içinde tek para, savunma birliği gibi konularda bütünleşmek isteyen üye ülkeler bulunacak, bunun çevresindeki halka ise kamu hukuku halkası olacaktır. Bu kapsamda bütün üye ülkeleri içerecek, daha dış bir halka bütün aday üye ülkeleri kapsayabilecektir (Verhofstadt, 2005).

## 5   Batı Balkanlara Genişleme Süreci ve Aday Ülkeler

Avrupa Birliği Batı Balkan ülkelerinden Sırbistan, Karadağ, Arnavutluk ve Bosna Hersek'i "dış ilişkiler" *(external relations)* kapsamından çıkararak 2005 yılında "genişleme" *(enlargement)* sürecine dahil etmiştir. İstikrar ve Ortaklık Süreci *(stabilisation and association process: SAP)* kapsamında Arnavutluk, Bosna Hersek, Sırbistan, Karadağ ve Kosova'nın bulunduğu, 6 Kasım 2007 tarihli genişlemeye ilişkin 2007 Strateji Belgesi'nde yer almıştır. Aralık 2007 AB Zirvesi'nde ve 13 Şubat 2008 tarihinde yayınlanan 2009 yılı Topluluk Stratejisi'nde de bu durum onaylanmıştır (EU, Enlargement: Priorities for 2014).

Batı Balkan ülkelerinden Makedonya 17 Aralık 2005, Karadağ 17 Aralık 2010 tarihinde aday ülke statüsünü kazanmıştır. Avrupa Birliği'ne üyelik için başvuran fakat adaylık statüsü verilmeyen ülke Arnavutluk'tur. Üyelik için başvuruda bulunmayan iki ülkeden biri Bosna-Hersek diğeri Kosova'dır. Kosova, potansiyel aday ülke konumundadır. Makedonya ile 9 Nisan 2001, Arnavutluk ile 12 Haziran 2006, Bosna-Hersek ile 16 Haziran 2008, Karadağ ile 15 Ekim 2007, Sırbistan ile 29 Nisan 2008 tarihinde İstikrar ve Ortaklık Anlaşmaları *(stabilisation and association agreement: SAA)* imzalanmıştır. Bosna-Hersek ile müzakere edilen İstikrar ve Ortaklık Anlaşması Aralık 2007'de sonlandırılmıştır.

Bosna-Hersek, AB açısından günümüzde "ortak ülke" *(associate)* statüsünde potansiyel aday ülkedir. Batı Balkan ülkeleri arasında Sırbistan ve Hırvatistan'dan sonra gelmektedir. Şubat 1992 tarihinde bağımsızlığını ilan eden Bosna-Hersek, 7 Nisan 1992'de ABD ve diğer Batılı ülkelerce tanınmıştır. 22 Mayıs 1992'de Birleşmiş Milletlere yaptığı üyelik başvurusu kabul edilmiştir. 1 Mart 1992 tarihinden bu yana bağımsız bir ülkedir. 1992-1995 yılları arasındaki iç savaşı sona erdiren Dayton Barış Anlaşması sonucunda Bosna-Hersek Federasyonu ve Sırp Cumhuriyeti olarak iki büyük bölge olarak yeniden yapılandırılmıştır.

Eski Yugoslavya Cumhuriyeti Makedonya 1991 yılında bağımsızlığını kazanınca, 22 Mart 2004 tarihinde AB'ye üyelik başvurusunda bulunmuştur. 1 Nisan 2004 tarihinde Makedonya ile İstikrar ve Ortaklık Anlaşması imzalanmış, 19 Aralık 2009 tarihinde Schengen Alanı'na girişte ülke vatandaşlarına yönelik vize kaldırılmıştır. Makedonya'nın üyelik başvurusuna Komisyon 9 Kasım 2005 tarihinde olumlu görüş belirtmiş ve bu ülke 16 Aralık 2005 tarihinde aday ülke statüsüne kavuşmuştur.

Avrupa Parlamentosu'nun 11 Şubat 2010 tarihinde kabul ettiği karar tasarısında, milletvekilleri Yunanistan'ın Batı Balkan ülkelerinin Birliğe katılımı için önerdiği 2014 yılının sembolik bir hedef tarih olması fikrini benimsemişlerdir. Karar tasarısı Slovenyalı üye Zoran Thaler tarafından sunulmuş ve 548 oyla kabul edilmiştir. Oylamada 45 milletvekili ret, 25 üye çekimser oy kullanmıştır. Parlamento Konsey'den Mart 2010 zirvesinde müzakerelerin açılması talebinin kabul edilmesini istemiştir. Makedonya'nın ismi ile ilgili olarak Yunanistan ile yaşadığı anlaşmazlık konusunda Parlamento, eski Yugoslavya ve Makedonya Cumhuriyeti ile Yunanistan hükümetlerinden bu sorunun çözümü için daha fazla çaba harcamalarını istemiştir. Makedonya'ya ilişkin isim sorunu henüz çözülememiştir.

Yugoslavya'nın dağılmasının ardından bir süre Sırbistan'la kader birliği yapan Karadağ *(Montenegro)* 28 Haziran 2006'da bağımsızlığını kazanarak Birleşmiş Milletler'in 192'nci üyesi olmuştur. Karadağ'ın Haziran 2006'da Avrupa Konseyi'nde bağımsızlığı onaylandıktan sonra ülkeye Avrupa Perspektifi verilmesi onaylanmıştır. 15 Ekim 2007 tarihinde Karadağ ile İstikrar ve Ortaklık Anlaşması imzalanmıştır. 17 Aralık 2010 tarihinde Konsey Karadağ'ın adaylığını onaylamıştır. 15 Aralık 2008'de Karadağ üyelik başvurusunda bulunmuştur. 23 Nisan 2009'da Konsey, Komisyon'dan üyelik başvurusu için rapor hazırlamasını istemiştir. Komisyon 9 Kasım 2010 tarihinde açıkladığı görüşünde bu ülkenin katılım müzakerelerine başlayabileceğini belirtmiştir. Aralık 2011'de AB Konseyi müzakerelerin başlamasını kararlaştırmış, 29 Haziran 2012 tarihinde müzakerelere başlanmış ve 18 Aralık 2012 tarihinde Bilim ve Teknoloji başlığı geçici olarak kapatılmıştır. Karadağ vatandaşlarına uygulanan vize 19 Aralık 2009 tarihinde kaldırılmıştır.

Karadağ, Haziran 2012'de başladığı katılım müzakerelerinde önemli yol almış, 35 başlıktan yedisini açmış, iki başlığı geçici olarak kapatmıştır. Karadağ, AB'nin özellikle Romanya ve Bulgaristan'ın hukukun üstünlüğü alanındaki eksiklerine rağmen AB'ye üye olmalarının ardından AB'nin geliştirdiği "yeni yaklaşım" uyarınca müzakerelerde öncelikli olarak ele alınacak olan "Yargı ve Temel Haklar" ile "Adalet, Özgürlük ve Güvenlik" başlıklarına kadar ilerlemiştir.

1 Haziran 2000 tarihli Feira Zirvesi'nde AB ile İstikrar ve Ortaklık Süreci'ndeki *(SAP)* ülkelerinin AB'ye potansiyel adaylıkları kabul edilince Sırbistan'da bu kapsama girmiştir. 1 Haziran 2003 Selanik Zirvesi'nde SAP sürecinin Batı Balkan ülkelerinin AB'ye entegrasyonunda temel ilke olduğu benimsenmiş, 7 Kasım 2007'de Sırbistan ile SAA müzakereleri başlatılmıştır. 1 Ocak 2008 tarihinde Vize Kolaylaştırıcı ve Geri Kabul Anlaşması yürürlüğe girmiş, 29 Nisan 2008'de SAA ile Ticaret ve Ticaretle İlgili Geçici Anlaşma Lüksemburg'da imzalanmıştır. 19 Aralık 2009'da Schengen Alanına seyahat edecek Sırp vatandaşlarına yönelik vizeler kaldırılmıştır.

Sırbistan 22 Aralık 2009 tarihinde AB'ye üyelik başvurusunda bulunmuş, fakat Eski Yugoslavya Uluslararası Ceza Mahkemesi *(ICTY)* ile işbirliği konusunda gerekenleri yapmadığı gerekçesiyle eleştirilmiştir. Mayıs 2011'de Srebrenitsa katliamından sorumlu tutulan Ratko Mladiç'in Temmuz 2011'de ise Hırvatistan'daki

Krayina bölgesindeki katliamlardan sorumlu Goran Haciç'in yakalanması ve Lahey'e gönderilmesiyle Sırbistan'ın önündeki engel kalkmıştır. Avrupa Komisyonu Sırbistan'ın üyeliğine ilişkin 14 Ekim 2011'de açıkladığı görüşünde, ülkenin ICTY ile işbirliği yaptığı için Sırbistan'a adaylık statüsü verilmesini önermiştir. Fakat Komisyon, tanımadığı Kosova ile ilişkilerini normalleştirilmesini ve AB arabuluculuğunda Sırbistan ile Kosova arasında yürütülen Belgrad-Priştine diyaloğunda ilerleme kaydedilmesini de şart koşmuştur.

Aralık 2011 AB Liderler Zirvesi'nde aday ülke statüsünü almayı bekleyen Belgrad'ın adaylığı varılan anlaşmaları uygulamakta geciktiği ve Kosova'nın kuzeyindeki Sırpları kışkırttığı gerekçesiyle ertelenmiştir. Mart 2012 AB Konseyi toplantısı öncesinde Belgrad-Priştine diyaloğunda Kosova'nın bölgesel platformlarda temsili ve bütünleştirilmiş sınır yönetimi konularda anlaşmaya varılması sonucunda Avrupa Konseyi Sırbistan'ın adaylığını 1 Mart 2012'de onaylamıştır. Komisyon, 10 Ekim 2012 tarihinde açıkladığı Genişleme Stratejisi'nde Kosova ile ilişkilerin normalleştirilmesi önceliği sağlanır sağlanmaz Sırbistan ile katılım müzakerelerinin başlanmasını önermiştir. AB arabuluculuğunda Mart 2011 tarihinde Sırbistan ve Kosova arasında her iki ülkenin halklarının yaşamlarının kolaylaştırılması amacıyla başlatılan Belgrad-Priştine diyaloğu, Ekim 2012'de Başbakanlar seviyesine yükseltilmiştir.

AB Konseyi, Sırbistan ile katılım müzakerelerinin başlanmasına ilişkin kararın, 2013 yılı ilkbaharında AB Dışişleri ve Güvenlik Politikası Yüksek Temsilcisi ve Avrupa Komisyonu tarafından ortaklaşa hazırlanacak rapor ışığında Haziran 2013'te yapılacak AB Liderler Zirvesi'nde verileceğini açıklamıştır. 19 Nisan 2013 tarihinde Sırbistan ve Kosova Başbakanları AB arabuluculuğundaki Belgrad-Priştine diyalogunun onuncu toplantısında; Priştine'nin otoritesini reddeden ve Belgrad tarafından finanse edilen paralel kurumlarla yönetilen Kuzey Kosova'nın yönetimi ve ilişkilerin normalleştirilmesi yolunda anlaşma parafe edilmiştir.

Bunun üzerine Ashton, 22 Nisan 2013'te Komisyon ile birlikte sunduğu ortak raporda Sırbistan'ın tek kilit önceliği başarılı bir şekilde yerine getirdiğini belirtmiş ve Sırbistan ile katılım müzakerelerinin başlatılmasını tavsiye etmiştir. 27-28 Haziran 2013 tarihlerinde gerçekleşen AB Liderler Zirvesi'nde, Sırbistan ile katılım müzakerelerine başlanması kararı alınmıştır. Yeni yaklaşım kapsamında öncelik kazanan 23 ve 24'ncü başlıklar 2014 yılının ikinci yarısında açılabilecektir. Kosova konusu, Sırbistan'ın katılım müzakerelerinde 35'nci başlık içinde ele alınırken, AB'nin müzakerelerde en son ele almayı tercih ettiği bu başlık Sırbistan'ın katılım müzakerelerinde ilk etapta açılması beklenmektedir. Bu başlığın kapatılması ilişkilerin normalleşmesi durumunda mümkün olabilecektir (Tuhina, 2013).

## 6 AB'ye Potansiyel Aday Ülkeler: Arnavutluk, Bosna-Hersek ve Kosova

Arnavutluk'un potansiyel adaylığı Haziran 2003 Selanik Zirvesi'nde kabul edilmiştir. 12 Haziran 2006 tarihinde bu ülke ile İstikrar ve Ortaklık Anlaşması ile Geçici Anlaşma *(interim agreement)* imzalanmış, 1 Nisan 2009 tarihinde yürürlüğe girmiştir. 1 Aralık 2010 tarihinde Arnavutluk ile serbest vize anlaşması müzakerelerine başlanılmıştır. Arnavutluk 1 Nisan 2009'da Avrupa Birliği'ne üyelik başvurusunda bulunmuş, Komisyon 1 Kasım 2010 tarihinde başvuruyu onaylamıştır. 1 Şubat 2011'de Arnavutluk'un Birliğe üye olabilmesi için 12 öncelikli alanda gerekli reformları yerine getirmesi gerektiğini belirtmiştir.

Arnavutluk'ta Haziran 2009 seçimlerinin ardından muhalefetteki sosyalist partinin parlamentoyu boykot etmesi, AB yolunda ilerlemesi için gerekli reform gündemi de büyük ölçüde aksamıştır. Mayıs 2011 yerel seçimlerinde Merkez Seçim Kurulu'nun Tiran Belediye Başkanlığı seçiminde oyların yanlış sandıklara konulduğu gerekçesiyle yeniden sayılması yönündeki tartışmalı kararı, ülkedeki demokratik yapının sorgulanmasına yol açmıştır. 2011 yılının sonunda hükümet ve muhalefet arasında AB üyelik sürecini engelleyen siyasi krizlere son vermek için uzlaşma sağlanması üzerine Mart 2012'de Komisyon'un tavsiyelerini gerçekleştirmek için yeni bir eylem planı hazırlanmıştır.

Avrupa Komisyonu 10 Ekim 2012'de açıkladığı Genişleme Stratejisi'nde Arnavutluk'un belirlenen 12 öncelikten çoğunu yerine getirdiğini belirterek, yargı ve kamu idaresi reformu ile parlamentonun usul kurallarının gözden geçirilmesini tamamlanması durumunda Arnavutluk'a aday ülke statüsü verilmesini önermiştir.

AB Konseyi ise Komisyonu, geri kalan öncelikli alanlarda ilerleme kaydedildiğinde ülkenin yolsuzluk ve örgütlü suçlarla mücadele alanındaki performansını da değerlendiren bir rapor hazırlamakla görevlendirmiştir. Arnavutluk'un katılım müzakerelerine başlayabilmesi için reform taahhütlerini yerine getirmesi ve öncelikli alanlardaki reformları tamamlaması gerekmektedir.

23 Haziran 2013 tarihinde gerçekleşen parlamento seçimleri, ülkenin demokratik kurumlarının işleyişi ve AB yolundaki ilerlemesi bakımından önemli bir testtir. Uluslararası gözlemciler seçimlerin öncekilere göre temel haklara saygı duyulan bir ortamda geçtiği açıklamışlardır. AB tarafından müzakerelere başlaması için yerine getirmesi gereken 12 öncelikli alanda başarı sağlayan Arnavutluk'a aday ülke statüsü verilmesi konusu Haziran 2014'te Komisyon'un ülkenin yolsuzlukla mücadele, yargı reformu ve örgütlü suçlarla mücadele alanlarında kabul edilen yasaların uygulanmasına ilişkin ilerlemesin değerlendiren raporu göz önünde bulundurularak verilebilecektir. Arnavutluk vatandaşlarına vizesiz seyahat imkanı sağlanmıştır.

Haziran 2003 Selanik Zirvesi'nde Bosna Hersek potansiyel aday ülke olarak kabul edilmiştir. Henüz AB'ye üyelik başvurusunda bulunmamıştır. 1 Ocak 2003'te İstikrar ve Ortaklık Anlaşması imzalanması için görüşmelere 25 Kasım 2005 tarihinde başlanılmıştır. 16 Haziran 2008'de bu ülke ile İstikrar ve Ortaklık Anlaşması ile Ticaretle İlgili Geçici Anlaşma imzalanmış ve 1 Temmuz 2008'de, 18 Eylül 2007 tarihinde Vize Kolaylaştırma ve Geri Kabul Anlaşması imzalanmış ve 1 Ocak 2008'de yürürlüğe girmiştir. 15 Aralık 2010'da biometrik pasaporta sahip olan ülke vatandaşlarının Schengen Alanı'na vizesiz girişi sağlanmıştır.

Avrupa Komisyonu, 27 Haziran 2012 tarihinde Bosna-Hersek ile Katılım Sürecine İlişkin Yüksek Düzey Diyaloğu *(high level dialogue on the accession process: HLDAP)* başlatmış ve AB'ye üyelik başvurusunda bulunabilmesi için İstikrar ve Ortaklık Anlaşması'nın yürürlüğe girebilmesi için yerine getirmesi gereken koşulları içeren bir yol haritası sunmuştur. Yol haritasına göre, Bosna-Hersek'in anayasasını Avrupa İnsan Hakları Mahkemesi'nin 2009 yılında aldığı Sejdi-Finci kararı doğrultusunda üç kurucu halk olan Boşnak, Sırp ve Hırvatlar dışındaki etnik grupların da üst düzey kamu görevlerine seçilebilmesine imkan sağlayacak şekilde değiştirmesi gerekmesine rağmen siyasiler arasında bir uzlaşma sağlanamamıştır (EC, 2010. Bosnia and Herzegovına Progress Report).

Avrupa Komisyonu, Bosna-Hersek anayasasını AİHM kararı doğrultusunda değiştirmediği sürece AB ile bütünleşme sürecinde ilerlemesinin mümkün olmayacağını açıklamış ve 2014 yılında yapılacak seçimlerin uluslararası standartlara uygun olarak gerçekleşmiş sayılmayacağını belirtmiştir. 1992-1995 Savaşı'nı sonlandıran Dayton Barış Anlaşması'nın yarattığı karmaşık idari yapı ve ülkedeki siyasi istikrarsızlık, Bosna-Hersek'in üyelik sürecindeki en büyük engeldir. Bosna-Hersek'te Ekim 2010 seçimlerinden sonra 16 ay boyunca hükümet kurulamamış, bu durum AB yolunda uygulanması gereken reformları aksaklığa uğramıştır.

Bosna-Hersek'in AB üyelik başvurusunda bulunabilmesi için ön şart kabul edilen İstikrar ve Ortaklık Anlaşması'nın yürürlüğe girebilmesi için Anayasası'nı Avrupa İnsan Hakları Mahkemesi'nin Sejdić-Finci Kararı (**ECHR, 2009. Sejdic and Finci v. Bosnia and Herzegovina)** doğrultusunda değiştirmesi gereklidir. Bosna-Hersek, bu konuda gerekenleri yapmadığı için 2013 yılında katılım öncesi yardım aracı *(IPA)* kapsamında alması öngörülen fonların önemli bir kısmını alamamıştır. AB, 2014 yılında yapılacak seçimlerin Sejdic-Finci Kararı uygulanmadığı takdirde (Bosnia-Herzegovina-EU, 2014) uluslararası standartlara uygun gerçekleşmiş kabul etmeyeceğini açıklamıştır. Bosna-Hersek vatandaşlarına vizesiz seyahat imkanı sağlanmıştır.

Avrupa Birliği 1 Mayıs 1999 tarihinde 5 Güney-Doğu Avrupa ülkesi ile İstikrar ve Ortaklık Süreci'ni başlatmış, 1 Kasım 2000 Zagrep Zirvesi'nde bu ülkeler ile SAP süreci uygulamaya konulmuştur. Kosova Parlamentosu 17 Şubat 2008 tarihinde Sırbistan'dan bağımsızlığını ilan etmiş, ABD, İngiltere, Fransa, Almanya ve Türkiye Kosova'nın bağımsızlığını tanımıştır. Avrupa Konseyi Kosova'nın bağımsızlığı 18 Şubat 2008 tarihinde kendine özgü bir durum *(sui generis)* olarak değerlendirmiştir. 15 Haziran 2008'da Anayasa kabul edilmiş, 14 Ekim 2009'de Komisyon Kosova'nın Avrupa Perspektifini yerine getirdiğini açıklamış, 22 Temmuz 2010 tarihinde Uluslararası Adalet Divanı Kosova'nın bağımsızlığını kabul eden bir tavsiye kararı almış, 19 Ocak 2012'de Komisyon Kosova ile vize serbestîleştirilmesi diyalogunu başlatmıştır.

Avrupa Komisyonu 27 Mart 2012 tarihinde ileride İstikrar ve İşbirliği Anlaşması müzakerelerine başlanması görüşüyle İstikrar ve İşbirliği Anlaşması'na yönelik fizibilite çalışması yapılmasını onaylamıştır. Çalışmanın sonuçlarını 2012-13 Genişleme Stratejisi kapsamında açıklayan Komisyon, Kosova'nın Anlaşma'ya yönelik müzakerelere başlamak için hazır olduğunu belirtmiş ve kısa vadeli önceliklerde yeterli ilerleme kaydedildiği takdirde müzakere direktiflerini sunacağını açıklamıştır.

19 Nisan 2013'te Kosova ile Sırbistan Başbakanları arasında AB Dışişleri ve Güvenlik Politikası Yüksek Temsilcisi Catherine Ashton arabuluculuğunda iki ülke arasındaki ilişkilerin normalleştirilmesi amacıyla yürütülen diyalogda, Kuzey Kosova'nın yönetimi ve ilişkilerin normalleştirilmesi konusunda anlaşmaya varılmıştır. 19 Ekim 2012'da Kosova ile Sırbistan arasında yüksek seviyeli görüşmelere başlanılmıştır. Komisyon ve Yüksek Temsilci tarafından 22 Nisan 2013'te sunulan raporda, Kosova'nın belirlenen öncelikleri yerine getirdiği belirtilmiş ve Kosova ile Anlaşma 'ya yönelik müzakerelere başlanmasını önerilmiştir. Komisyon, Kosova'nın AB programlarına katılımına imkan sağlayacak bir teklif sunmuştur. 27-28 Haziran 2013 tarihinde AB liderleri Kosova ile İstikrar ve Ortaklık Anlaşması müzakerelerine başlanmasına onay vermiştir.

Kosova'nın beş AB üyesi devlet *(Romanya, Slovakya, İspanya, Yunanistan ve GKRY)* tarafından tanınmaması ve AB'nin Kosova'nın statüsüne ilişkin ortak bir görüşü olmaması Kosova'nın AB ile ilişkilerindeki en büyük sorundur. Nisan 2013'te Kosova ile Sırbistan arasında ikili ilişkilerin normalleştirilmesine ilişkin imzalanan anlaşmadan sonra Kosova'nın AB ile SAA'ya yönelik müzakerelere başlamaya hazır olduğu kabul edilmiş ve Ekim 2013'te SAA müzakerelerine başlanmıştır. SAA'nın taslak metni 2014 yazında parafe edildikten sonra AB Konseyi'ne ve Avrupa Parlamentosu'na onaylanması için sunulacaktır. Kosova'nın örgütlü suçlar ve yolsuzluk alanında da sorunlarını da çözmesi üyelik sürecinde ilerlemesi için bir ön şarttır.

## 7  Sonuç

Balkanlar, coğrafi, siyasi, ekonomik açıdan olduğu kadar tarihi, kültürel ve insani bağlar bakımından Türkiye için öncelik taşımaktadır. Çünkü Türkiye de Balkan ülkesi sayılır. Balkanlar; Türkiye'nin Batı ile irtibatını

sağlayan tek kara bağlantısıdır, Türkiye üzerinden geçecek enerji nakil hatlarının transit güzergahıdır, ekonomik ilişkilerimiz açısından önemli bir yere sahiptir. Ayrıca Balkanlarda önemli bir Türk nüfus yaşamaktadır. Balkanlar, 1990'lı yıllarda savaşlara ve etnik temizliğe maruz kalmış, bugünkü barış ve istikrar ortamı ancak uluslararası müdahale sonunda sağlanabilmiştir. Balkanlar'da barış ve istikrarın korunması Türkiye için önemlidir.    Yugoslavya'nın dağılması sonucu eski Yugoslavya'dan 7 bağımsız devlet ortaya çıkmış, Balkanlar'daki dengeler sarsılmış, istikrarsızlık bölgesel açıdan tehlikeli boyutlara ulaşmıştır.

Türkiye Balkanlar'daki işbirliği mekanizmalarının geliştirilmesi üzerinde önemle durmaktadır (TÜSİAD, 2011). İyi komşuluk ilişkileri ve bölgesel işbirliği kapsamında Türkiye'nin inisiyatifi ile gerçekleştirilen Türkiye-Hırvatistan-Bosna-Hersek ve Türkiye-Sırbistan-Bosna-Hersek üçlü danışma mekanizmaları oluşturulmuştur. Bu işbirliği mekanizmaları ile bir yandan Bosna-Hersek'te barış, istikrar ve refahın pekiştirilmesine çalışılmakta, diğer yandan Balkanların daha istikrarlı hale gelmesine çaba gösterilmektedir. Türkiye, bölgede kalıcı barış ve istikrarın sağlanması bakımından bölge ülkelerinin Avrupa ve Avrupa-Atlantik kurumlarına entegrasyonunun gerekli olduğu düşüncesiyle bu ülkeleri desteklemeyi sürdürmektedir. Türkiye, bölge ülkelerine siyasi ilişkilerin dışındaki alanlarda da destek ve yardım sağlamaktadır. Ekonomi, kültür, ortak tarihi miras, eğitim, askeri ve güvenlik gibi pek çok alanı kapsayan bu yardımlar ilgili devlet kurumları tarafından ikili anlaşmalar çerçevesinde ve dayanışma ruhu içerisinde gerçekleştirilmektedir.

Avrupa Komisyonu, 2014 yılı genişleme politikası önceliklerini temel konuların öncelikle ele alınması *(fundamentals first)* olarak belirlemiştir. Bu kapsamda hukukun üstünlüğüne öncelik veren yeni yaklaşım kapsamında Balkanlardaki gelişmeleri yakından izleyecektir. Batı Balkan ülkeleri AB'de ekonomik krizi aşma sürecindeki gelişmelerin gerisinde kalmalarını önlemek için Komisyon'a reform programlarını içeren ekonomi raporlarını sunacaklar, demokratik kurumların işleyişi, ifade ve medya özgürlüğü, insan hakları ve azınlıkların korunması ile iyi komşuluk ilişkilerine ve en önemlisi reformların uygulanmasına öncelik vereceklerdir. Çünkü AB, kâğıt üzerinde kalan hukuki düzenlemelerden çok uygulamaya önem vermektedir.

2014 yılında Sırbistan katılım müzakerelerine başlayacaktır. Kosova'nın SAA müzakerelerini tamamlaması ve Arnavutluk'un adaylık statüsü kazanması mümkündür. AB üyelik surecinde Türkiye gibi engellemeler ile karşılaşan Makedonya'nın AB ile bütünleşme sürecindeki sorunların giderilmesi ve AB üyelik sürecinde Bosna-Hersek'in de 2014 yılında ilerleme sağlaması ümit edilmektedir. Avrupa Birliği'nin Balkanlara genişlemesiyle Avrupa kıtasında Türkiye dışında genişlemenin sınırlarına ulaşılacak ve kıta bir barış ve refah bölgesi olarak dünya ekonomisindeki yerini alacaktır.

# Assessing the Impact of Foreign Direct Investments on Export Performance of Macedonia and Turkey

Prof. Dr. Vesna Bucevska (Ss. Cyril and Methodius University, Macedonia)

## Abstract

Export has been in the focus of economic literature for years due to its multi-fold contribution to the macroeconomic stability and economic growth. These contributions are of great importance for Macedonia and Turkey on their way to becoming full members of the European Union. The objective of this paper is to investigate empirically the impact of the inward foreign direct investments (FDI) on export performance of Macedonia and Turkey. To achieve this objective we use a popular model of export and estimate two models. The first (benchmark) model includes the real effective exchange rate, the potential GDP, trade liberalization and export in the previous year. Along with these explanatory variables, in the second model we include the FDI inflows variable. The results of the benchmark model indicate that trade liberalization has a positive and significant impact on export. The export performance is positively and significantly affected by the last year's exports. The estimated coefficient of real effective exchange rate is not statistically significant. The potential output has a positive impact on the increase of export but it is also statistically not significant. The results of the second model indicate that FDI have a positive impact on export performance of Macedonia and Turkey, but not significant. The other explanatory variables have kept their signs as in benchmark model and only trade liberalization and the export from the previous period remained statistically significant.

## 1 Introduction

Export has been in the focus of economic literature and policy making for years due to its multi-fold contribution to achieving and maintaining macroeconomic stability, resolving severe macroeconomic problems, like unemployment and trade deficit, accelerating the economic growth and increasing the international competitiveness of economies. These contributions are of great importance for Macedonia and Turkey for accelerating their full membership of European Union. Recent empirical studies have proven that the membership in economic integrations, such as the European Union, have a positive impact on improving export performance on a long-term. Therefore the increase of export of EU candidate countries will depend greatly on the readiness of these countries to enter the international market more aggressively with improved international competitiveness of their goods and services.

In the recent years Macedonia and Turkey have been experiencing a constant growth of their total value of goods exported. In the period 2001-2011, despite the global financial and economic crisis which affected the whole world, Turkey's exports of goods increased 2,7 times and Macedonia's exports grew by 2,5 times. "The total value of the goods exported by Turkey in 2011 was roughly three times the value of export of all the other enlargement countries combined."(European Commission 2013, p. 80)

**Table 1.** *International trade in goods. (million EUR)* **Source:** *EUROSTAT Database, epp.eurostat.ec.europa.eu.*

With regard to the relative importance of the exports of goods for the national economy, expressed as a percentage of GDP, this indicator in 2011 was particularly high in Macedonia (43%), compared to 17,5 in Turkey.

The European Union member countries are the main trading partners for Macedonia and Turkey. According to the European Commission (2013), 60 % of all goods exported by Macedonia went to the EU-27, and 43% of Turkey's exports of goods were directed to the European Union (Figure 1).

*Table 2. International trade in goods (% of GDP) **Source:** EUROSTAT Database, epp.eurostat.ec.europa.eu*

*Figure 1. International trade of EU enlargement countries with EU-27 **Source:** EUROSTAT Database*

Although in the last decade Macedonia and Turkey have been experiencing a constant growth of the value of exports of goods, with an average annual growth rate of 9% in Macedonia and 11% in Turkey, as a result of market-oriented reform processes, often associated with NATO and EU accession, the two analyzed EU candidate countries recorded far higher goods trade deficits as a percentage of the total trade volume (value of export and imports) in 2011. Turkey doubled its trade deficit, from 14% in 2001 to 28% in 2011, and Macedonia increased its deficit from 19% in 2001 to 22% in 2011.

*Figure 2. Trade deficits of EU enlargement countries (% of the total trade volume) **Source:** EUROSTAT*

Regarding the global foreign direct investment inflows to the EU candidate countries these countries "have attracted considerable FDI over the past decade, which to a large extent has helped in covering their current account deficits" (Orszaghova, et al., 2013, p.34).

The levels of the global FDI inflows to the EU candidate countries experienced a drop in most countries in 2002, after which an upward trend was generally observed until 2007, when they reached their peak, growing particularly strongly between 2005 and 2007 in Turkey (with rates of 240%, and 120% respectively). Macedonia recorded the largest growth of FDI inflows (by 7 times) in the period between 2005 and 2007. However, as a result of the worldwide financial and economic crisis, the global FDI inflows to Macedonia and Turkey declined sharply between 2007 and 2009 (by 3.5 and 2.5 times, respectively).

**Figure 3.** *Global FDI inflows to the EU candidate countries, annual, in millions of US Dollars, 2000-2012*
*Source: UNCTAD, FDI/TNC database*

The EU-27 traditionally have been the largest sources of FDI inflows in the EU candidate countries. Macedonia recorded a five-fold increase in the amount of the EU-27's FDI inflows between 2005 and 2007, from EUR 45.8 million in 2005 to EUR 233 million in 2007. The FDI flows from EU-27's direct investors to Turkey increased significantly (by three times) between 2005 and 2007, peaking at EUR 15 billion in 2007. As a result of the global financial crisis and recession in Germany and other major EU economies, the FDI outward flows from the European Union to Macedonia have dropped sharply (by 60%) in 2010 compared to 2007. In the same time frame, the EU-27's FDI outward flows to Turkey in 2009 have decreased by 67% compared to 2007.

Having in mind that export is the engine of the economic growth, it is very important to estimate empirically the impact of FDI on export performance of the host (recipient) countries. While there are numerous theoretical and empirical studies about the relationship between FDI and export performance, there are no studies treating this issue in the case of Macedonia and Turkey as EU candidate countries.

The purpose of this paper is to investigate empirically the impact of the FDI inflows on the export performance of Macedonia and Turkey as EU candidate countries. The issue is important because the promotion of inward FDI in the sample countries as EU candidate countries is one of the key issues of their economic programs.

The paper is organized as follows: In Section 2 we undertake a brief review of the literature on the different potential effects of FDI inflows on the host countries' exports. In Section 3 we investigate a number of determinants that could influence export and estimate two specified econometric models. The last, fourth section discuss the obtained empirical results and draws some conclusions.

## 2   Literature Review

In this section we undertake a brief review of theoretical literature and empirical studies regarding the direct and indirect potential effects of FDI inflows on the host country's exports.

From a theoretical point of view, the causality between FDI inflows and the host country's exports can be explained with the Akamatsu's model of flying gees, Vernon's theory of Product Life Cycle (PCL) and the New Trade theory.

The model of Flying Geese which was introduced by Akamatsu (1962) establishes a complementary relationship between FDI and trade. According to this model the multinational enterprises (MNE) contribute to an increase of the host country's exports through utilization of the lower costs of production, mainly labor costs, which improves their competitiveness. The improved competitiveness of the MNE directly improves the export performance of the host country by increasing the export supply capacity of the host country, and indirectly though transfer of new technologies, equipment and managerial expertise into the host countries.

The product cycle theory (PCT) of trade, developed in 1966 by Raymond Vernon, is concerned with the life cycle of a typical "new product" and its impact on international trade. PCT was developed in response to the failure of the United States to conform empirically to the Heckscher-Ohlin model.

The PCT divides the life cycle of the new product into three stages. In the first stage, the new product stage, the product is produced and consumed only in the United States and no international trade takes place. In the second stage of the life cycle maturing product stage some general standards for the product and its characteristics begin to emerge, and mass production techniques start to be adopted. With more standardization in the production process, economies of scale start to be realized. In addition, foreign demand for the product grows, but it is associated particularly with other developed countries, since the product is catering to high-income demands. This rise in foreign demand (assisted by economies of scale) leads to a trade pattern whereby the United States exports the product to other high-income countries. In the maturing product stage U.S. firms may begin to assess the possibilities of producing abroad in addition to producing in the United States. If the production costs abroad are lower, then U.S. firms will tend to establish production facilities in the other developed countries. This relocation-of-production aspect of the PCT is a useful step because it recognizes - in contract to H-O and Ricardo - that capital and management are not immobile internationally.

The final stage is the standardized product stage. By this time in the product's life cycle, the characteristics of the product itself and of the production process are well known and production may shift to the developing countries. Labor costs again play an important role, and the developed countries are busy introducing other products. Thus, the trade pattern is that the United States and other developed countries may import the product from the developing countries. In summary, the PCT postulates a dynamic comparative advantage because the country source of exports shifts throughout the life cycle of the product. The dynamic comparative advantage, together with factor mobility and economies of scale, makes the product cycle theory an appealing alternative to the Heckscher-Ohlin model.

Applying Vernon's model at industry level, Kojima (1985) found when FDI is made in the sector in which the country of origin has comparative disadvantage and the host country has comparative advantage, then this kind of investment has trade creating effect implying that the host country's export will increase.

The new trade theory (NTT), developed in the late 70s and early 80s, represents a collection of economic models in international trade which concentrate on the role of increasing returns to scale and a preference for diversity in consumption opposite to the unlimited free trade theory which concentrates on the comparative advantage of countries with very different characteristics. However, the trade between countries with similar characteristics in the 20th century increased as such international trade allowed firms to save on costs by producing at a larger, more efficient scale, and because it increases the range of brands available and sharpens the competition between firms. This phenomenon initiated the development of other economic models which are based on the assumptions that some countries have advantages in producing certain goods and that there are difficulties in the globalization of trade. The authors of these models Krugman (1979) suggest that countries with an advantage in producing certain goods could benefit if they initially protect the trade of such goods. Many models of international trade have followed Krugman's model. Helpman (1984) and Helpman and Krugman (1985), assuming no transaction cost, argue if choice of location of production facilities is based on relative factor prices and recourse endowments, then, vertical FDI would cause trade creation effect in the form of export of finished product from affiliate company to parent company and intra firm transfer of intangible services from parent company to affiliate company.

The number of empirical studies on the effect of the inward FDI on export performance of host countries is relatively limited compared to that on productivity spillovers and they provide mixed results (positive, negative and weak impact) for different countries.

Aitken et al. (1997) investigated the role of geographic and multinational spillovers on the export decisions of local companies in Mexico in the period 1986-1989 by estimating a probit model. They find evidence that export activities by multinational firms positively affect the export activity of the domestic firms in the same sector of a firm in the same sector and region being an exporter.

By using panel data for companies in the United Kingdom in the period 1992–1996, Greenaway et al. (2004) find that that the probability of exporting is affected positively by both total and MNE export activity, and that MNE employment, and not MNE export activity, generates positive spillovers on firms' export propensity

Ruane and Sutherland (2005) find similar evidence for Ireland for the period 1991–98 i.e. that the presence of multinational enterprises in one sector positively affects the decision of the domestic forms in that sector to export their good and services. However, they find that the export intensity of MNEs is negatively influenced by the export decision and export intensity of domestic firms on the manufacturing sector.

Kutan and Vuksic (2007) test the direct and indirect effects of FDI inflows in twelve Central and Eastern European economies in the period 1996-2004 and find that FDI have contributed to an increase of exports by increasing the domestic supply capacity and that FDI have indirect effects on exports only in the new member states of the European Union.

On the other hand, Khan and Leng (1997) do not find evidence that FDI affects the export of Taiwan and South Korea. By investigating a sample of U.S. manufacturing firms in the period 1984-1992, Bernard and Jensen (2004) finds evidence of negative spillovers of FDI on the export activities of the U.S. firms. Barrios et al. (2003) find no spillover from the export activities by MNEs on the likelihood of export by Spanish companies

While there are a number of studies on the determinants of inward FDI to Turkey and Macedonia (Erdilek (1982), Coskun (1996, 2001), Tatoglu & Glaister (2000), Halicioglu (2001), Erdal & Tatoglu (2002)), the number of studies that analyze the impact of FDI on the export performance of these EU candidate countries is very limited. The purpose of this paper is to contribute to the existing literature by investigating the direct and indirect effects of inward FDI on the export performance of Macedonia and Turkey as EU candidate countries.

## 3   Data, Variables and Models Specification

The existing theoretical and empirical studies find the following variables: the real effective exchange rate, the gross domestic product (*GDP*), the ratio of trade openness, the cumulative FDI stock and the export from the previous period, as most significant determinants of export.

The real effective exchange rate (*REER*) is one of the most important determinants of a country's export. It serves as a proxy of a country's international competitiveness. Overvaluation of the local currency reduces its exports due to lower competitiveness. On the other hand, the depreciation of the real exchange rate might increase country's exports through reduced prices of export goods. Therefore, it is expected the coefficient of REER to have a negative sign.

With regard to the FDI as a determinant of export, we take the FDI stock (*RFDI*) and not the FDI inflow in the host country, in order to assess the indirect FDI effects on the host country's export. If we include the FDI inflows, and not the FDI stock, as an explanatory variable in the model, it could happen that the value of FDI inflows into the host country in the first years of the sample period is very high compared to FDI inflows in the following years, which could reduce the significant impact of the FDI in the first years. Therefore, we include the variable cumulative FDI stock which is a proxy for the indirect effects of FDI on the host country's export. This variable enters our model with a lag of one period due to the fact that it takes some time for an export oriented FDI to build capacities in the host country and to achieve the desired level of production.

In order to differentiate between the direct and indirect effects of FDI on export performance, we also include the GDP per capita trend as a proxy for a domestic supply capacity. It is expected that this variable will encompass the effect of the increased domestic supply capacity as a result of FDI inflows. This variable also enters a model with a lag of one period as it takes time the increased domestic supply capacity to have an effect on increasing the value of export.

The country's trade openness degree (*TLI*) is obtained as a ratio between the sum of import and export of goods to GDP. This determinant is included into the model in order to account for the potential influence of trade liberalization measures taken by a country. The coefficient of this variable is expected to have a positive sign.

We have also included the real export from the previous period (*REXP$_{t-1}$*) in order to take into account the fact that export dynamics in one year is a good predictor of the export trend in next years.

Below we test the impact of the above described explanatory variables on real export, with specific focus on the FDI effects on host economies' exports by employing the models developed by Kutan and Vuksic (2007):

$$\ln REXP_{it} = \beta_0 + \beta_1 \ln GDP_{it-1} + \beta_2 \ln REER_{it} + \beta_3 \ln TLI_{it} + \beta_4 \ln REXP_{it-1} + u_t \qquad (1)$$

$$\ln REXP_{it} = \beta_0 + \beta_1 \ln GDP_{it-1} + \beta_2 \ln REER_{it} + \beta_3 \ln TLI_{it} + \beta_4 \ln REXP_{it-1} + \beta_5 \ln FDI_{it-1} + u_t \qquad (2)$$

where the subscript *i* denotes the EU candidate country and *t* denotes year in the period between 1999 and 2012. The model (1) is our benchmark model.

The estimation of the two models is based on the method of GLS, with country dummies in order to capture the unobserved country-specific variables, which influence countries' export performance using annual pooled data for Macedonia and Turkey for the period 1999-2012. For example country-specific variables can be the geographic position, natural resources or specific political conditions in the country and etc.

"To test the impact of FDI on exports, it is important that we control for the other determinants of exports". (Kutan and Vuksic, 2007, p.7) In the two model specifications we take the natural logarithm of real export (ln*REXP*) as an endogenous variable and the natural logarithms of the following exogenous variables: the real effective exchange rate index (*REER*) in order to capture the impact of relative prices on the exports, the trend of real GDP per capita through Hodrick -Prescott filter (*HP*), which represents a proxy for domestic supply capacity, the level of trade openness (*TLI*) of the host countries measured by the sum of exports and imports as a share of GDP, and the real export from the previous year (*REXP$_{t-1}$*), since the export performance in one year should be a good predictor of the next year's exports. In the second econometric model we add the cumulative

stock of FDI in the recipient countries (*FDI*). We use the real values of the dependent and all explanatory variables in order to eliminate the effect of price changes.

The data for the above described variables are obtained from the Eurostat database. However in order to obtain the real value of export and GDP per capita and the trade openness, we have made our own calculations. We have also tested the stationarity of all the variables and find out that all the variables are integrated of order 2, except REXP and REER which are integrated of order 1.

## 4   Results and Conclusion

The results of the estimation of the benchmark model obtained using the econometric software package EViews 6, are given in Table 3.

*Table 4. The effect of foreign direct investments on real export **Source:** Author's calculations*

The results show that the estimated coefficient of the real effective exchange rate (*REER*) does not only have the expected sign but it is also statistically insignificant. The insignificance of this variable can be explained by the fact that in the sample period both analyzed countries have fixed exchange rate regimes.

The trend of potential output (*HP*) has a positive impact on the increase of export and is not statistically significant at level of 0,05 significance.

The estimated coefficient of the variable *TLI* has a positive sign and is statistically significant.

The export performance is positively affected by the last year's exports and the estimated coefficient of this variable is highly statistically significant.

By adding the real value of the cumulative *FDI* stock variable to our benchmark model we estimate the model (2) and obtain the results shown in Table 4. As we can see from Table 4, the estimated coefficient of the *FDI* stock variable is positive, but not significant meaning that *FDI* does not exhibit direct, supply-increasing (since *HP* variable is also not significant) neither indirect, specific effects on the exports of Macedonia and Turkey. The other explanatory variables in the model have kept their expected signs (except *REER*) and only *TLI* and $REXP_{t-1}$ remain statistically significant when the cumulative *FDI* stock variable has been added.

In this study we have not find a significant influence of FDI on export spillovers to domestic firms. This can be explained by the fact that most of the inward FDI especially in Macedonia are directed to the free industrial zones and the foreign investors import the inputs (raw materials and intermediate products) for their processing from abroad without establishing business relationships with the local companies in the host country. The final products produced by the MNEs operating in these zones are exported. Therefore, they have neither positive effect on increasing the domestic supply capacity, nor they have specific effects on the value of host countries' exports.

# Endüstriyel Yığılma Ekonomileri Gümülcine-İskeçe-Dedeağaç Organize Sanayi Bölgeleri Örneği

# Industrial Agglomeration Economies: The Case of the Organized Industrial Zones of Komotini-Xanthi-Alexandroupolis

Serhat Şentürk (Dokuz Eylül University, Turkey)

Prof. Dr. Recep Kök (Dokuz Eylül University, Turkey)

## Abstract

Agglomeration economies brings innovation and high growth rates and describes the advantages of agglomeration as decreasing of transportation costs, providing skilled labor pool and knowledge spillover. We aim to evaluate the industrial agglomeration economies with regard to the organized industrial zones in Komotini, Xanthi and Alexandroupolis that are located in Western Thrace and to develop some suggestion on the zones' entrepreneurship potential. Survey data analysis; classification method; cluster analysis; factor analysis. Industrial agglomeration is an important concept on determining economic integration and dispersion of economic activities. Therefore, we consider the advantages of agglomeration and co-agglomeration in terms of the theoretical basis related to organized industrial zones as a model of industrial settlement. In this framework, in with model of industrial some surveys will be applied to 81 firms in the sample. The findings show that agglomeration economies support to competitive environment. This study will contribute to the policy suggestions on relations between Turkey and Greece in terms of forecasters of the related econometric application.

## 1 Giriş

Günümüzde küresel anlamda artan yoğun rekabet ve bunun çerçevesinde oluşan yenilik ve değişiklikler yaratma firmalar açısından bir arada bulunma ihtiyacıyla karşı karşıya getirme; kümelenme ihtiyacını doğurmuştur. Bu durum ülkelerin birbirleri ile ekonomik anlamda ilişkilerini artırmakta aynı zamanda çeşitli yapıların doğmasına öncülük etmektedir. Ayrıca zaman ve mekân kavramlarının kent, bölge ve ülke ekonomilerinin gelişme ve küresel yapıya ayak uydurma sürecinde önem teşkil etmekte beşeri sermaye ve teknoloji uyumunun bu yapıya entegre olmasına gerek duyulmaktadır. Bu açıdan bakıldığında firmaların önceden almış olduğu karar ve planlarda farklılıklar görülebilmektedir. Özellikle günümüzde bu tip yeni devinimlerle karşı karşıya kalındığında yeni kavramın açıklığa kavuşturulması için yeni kavramlar belirtilmekte ve bu kavramları tanıyabilmek için de örnekler ve modellerle kanıtlanabilme durumu oluşmaktadır.

Bu çerçevede firmaların bir arada kümelenme durumu literatürde "yığılma ekonomileri olarak" adlandırılmakta, kümelenme olgusunun etkilerini sonuçlarının açıklanmasında yardımcı olacak kaynakların neler olduğunu kestirebilmek büyük önem arz etmektedir (Krugman, 1991). Yığılma ekonomileri olgusunun özellikle azgelişmiş olan bölgelerde etkilerini incelemek açısından; gelişmiş bölge alt bölge ilişkisi, yaratılan pozitif ve negatif dışsallıklar bölgenin sosyo-kültürel açıdan ne denli önem arz ettiği şeklindeki spesifik konularda belirlenmeye çalışılmaktadır.

Genel anlamda; Ekonomik faaliyetlerin belirli bir mekânda toplanması ile ortaya çıkan ve maliyetlerde gerçekleşen azalmayı ifade eden etkiler "yığılma ekonomileri" olarak adlandırılmaktadır (Kıymalıoğlu ve Ayoğlu, 2006). Yığılma ekonomilerinin çeşitli büyüklükte ve etkinlikte olmaları, yığılma sürecinde gerçekleşen coğrafi görüntüyü farklılaştırmaktadır ve böylece ekonomik birimlerin yerleşimleri mekânsal bir eş dağılım göstermemektedir. Bu sebeple, mekânsal farklılaşmaya yol açan faktörlerin belirlenmesi önem taşımaktadır. Aynı bölge içerisinde bile farklı etkiler yaratabilen yığılma ekonomileri kavramı; tam anlamıyla varoluşları ve bölgeye etkileri açısından bir kavram kargaşası yaşamaktadır. Bu durum etkileri açısından yapılan yığılma ekonomileri literatür araştırmalarında görülmektedir.

Farklı şekilde yapılan araştırmalarda bu kavram üzerinde farklı tanımlamalarda mevcuttur. Bu çerçevede temel olarak ölçek ekonomileri, dışsal ekonomiler, artan getiriler ve eksik rekabetçi piyasa yapısı üzerinde şekillenen yığılma ekonomileri, kentsel ekonomi literatüründe yerelleşme ekonomileri ve kentleşme ekonomileri olarak ikiye ayrılır. Ancak, farklı sınıflandırmalar da söz konusudur. Bu çerçevede yığılma ekonomileri Yeni Ekonomik Coğrafya literatürü kapsamında statik (durağan) ve dinamik dışsallıklar bağlamında ele alınmaktadır (Kıymalıoğlu ve Ayoğlu, 2006).

Yığılma ekonomileri, içsel bağlantılı bir ekonomide mal ve hizmet üretimlerinin mekânsal yakınlığından sağlanan yararlardır. Mekânsal olarak yakın yerleşmenin firma ve endüstriler için önemli yararlar doğurduğu ilk kez 1920'li yıllarda ortaya koyulmuştur. Ekonomik faaliyetlerin bir araya toplanmasını özendirici faktörler genel olarak Marshallgil Dışsallıklar'la açıklanır (Kıymalıoğlu ve Ayoğlu, 2006).

Marshallgil dışsallıklar tanımında, nitelikli iş gücü piyasası ve özellikle uzmanlaşmış girdiler üreten endüstrilerin yanında, bilginin şirketler arasında yayılımından da bahsetmektedir. Bilginin özellikle coğrafi yakınlık içindeki kümelenme ve yığılma bölgelerinde daha hızlı yayılması, ürün veya süreç inovasyonları için çok uygun koşullar sağlamaktadır. Bu yığılma ve kümelenme merkezlerinden uzaklaşıldıkça dışsallıklarında azaldığı görülmektedir. İşte dışsallıkların bu boyutu yani bilgi yayılımları, modern içsel ekonomik büyüme literatüründeki dinamik dışsallıklar ile çakışmaktadır (Küçüker, 1998).

## 2   MAR Dışsallıkları

Bu dışsallıkları açıklamadan önce bu kapsamda yer alan dinamik dışsallık kavramını açıklamak daha yararlı olacaktır. Dinamik dışsallıkları tanımlayacak olursak; dinamik dışsallıklar, uzun dönem ilişkiler ve etkileşimlerin tarihi ile güçlenen yerel bilgi birikimleriyle gerçekleşmekte olup, ekonomik aktörler arasındaki iletişimlerle ortaya çıkmaktadır. Dinamik dışsallıklar iletişim ve etkileşimin yoğun olduğu durumda fikir ve bilgiler hızla yayılmakta ve iletişimin sıklığı ise coğrafi yakınlık tarafından belirlenmektedir. Özellikle bu yakınlık büyük kentlerde önemli bir dışsallık yaratmaktadır. Dinamik dışsallıklar, genel olarak teknolojik dışsallık niteliğindedir. Bir firma ya da endüstride gerçekleşen bir yenilik, bilgi yayılmaları yolu ile piyasa mekanizmasına dâhil olmadan diğer firma ve endüstrilere olumlu dışsallıklar sağlayıp verimliliklerini artırmaktadırlar (Kıymalıoğlu ve Ayoğlu, 2006). MAR dışsallıklarının büyüme ve inovasyon için önemli olduğu açıktır ve bu şekilde üç ana bilgi şeklinde ayrım yapılmıştır.

Dinamik dışsal ekonomiler, piyasa yapısının niteliğine ve bilgi kaynağına göre iki alt grupta incelenebilir. Teknolojik dışsallıkların önemi konusunda genel bir fikir birliği varmış gibi görünse de bu bilginin nereden geldiği konusunda süregelen bir tartışma söz konusudur.

Bilgi yayılmaları, aynı endüstri içinde ya da farklı endüstriler arasında gerçekleşebilir. Buna göre, dinamik dışsallık türleri aynı endüstride yer alan yerel firmalar arasında bilgi yayılımı ile ortaya çıkan ve tekelci piyasa yapıları ile uyumlu Marshall- Arrow- Romer (MAR) Dışsallıkları" ve farklı endüstriler arasında bilgi yayılımı ile ortaya çıkan ve rekabetçi piyasalar ile uyumlu Jacobs Dışsallıkları'dır (Kıymalıoğlu ve Ayoğlu, 2006).

MAR dışsallıkları ilk olarak Marshall tarafından ele alınmış daha sonra Kenneth Arrow ve Paul Romer tarafından geliştirilmiştir. Jacobs dışsallıkları farklı çevrelerdeki bireylerin birey- çevre ilişkilerini ele almakta, bireyin yaratacağı dışsallığın bilgi yayılması konusunda önem arz edeceğini belirtmektedir. Porter Dışsallıkları bilgi yayılımı konusunda; alıcı ve satıcı şeklinde oluşan iki taraflı endüstri ilişkileri şeklinde meydana geldiğini belirtmekte bilgi yayılması ve büyüme açısından piyasalarla uyumlu bir ilişkiye girilebileceği belirtilmektedir (Kalça ve Atasoy, 2008).

Öte yandan MAR dışsallıkları ile ilgili bir diğer önemli kavram ise bilgi dışsallıklarıdır. Bir firma veya endüstrinin gerçekleştirmekte olduğu yenilikçi faaliyetleri sonucunda yaratılan bilginin, bu faaliyetler gerçekleştirilirken katlanılan maliyetlere ortak olmayan diğer firma veya endüstrilere ekonomik fayda yaratması durumu, bilgi dışsallıkları olarak tanımlanmaktadır (Branstter, 1998). MAR dışsallıkları özel bilgi dışsallıklarının içerisinde yer almakta ve bu tür bilgi dışsallıklarının herhangi bir endüstrideki firmalar ile ilişkileri bilgi yayılımları şeklindedir. Endüstri içi firma ilişkilerinin içerisinde yüz yüze iletişim ve karşılıklı güvene dayalı olarak bilgi ve yenilik dağılımı daha hızlı gerçekleşip bunun sonucunda coğrafi kümelerin daha fazla yenilik fırsatları doğmasına neden olmaktadır (Breschi ve Lissoni, 2001).

Bu açıdan bakıldığında MAR dışsallıklarının endüstrilerde yer alan firmalar arasında bilgi yayılımına yönelik, etkileşim ve tekelci piyasa yapıları ile uyumlu sonuçlar doğurmaktadır. Bilgi yayılması; özellikle beşeri sermaye ve girişimcilik ruhu ile daha iyi noktalara ulaşılabilmektedir. Bahsi geçen dışsallıklara ilişkin aşağıdaki tablo değerlendirildiğinde şu şekilde bir tablo karşımıza çıkmaktadır.

| | | Piyasa yapısı | |
| --- | --- | --- | --- |
| | | Yüksek rekabet | Düşük rekabetçi |
| Bilginin En Etkili Kaynağı | Endüstri İçi (Uzmanlaşma ) | Porter Dışsallıkları | MAR Dışsallıkları Marshall(1890) Arrow (1962) Romer(1896,1990) |
| | Endüstrilerarası (Çeşitlilik) | Jacobs Dışsallıkları | - |

*Tablo 1. Dışsallık Tipolojisi Kaynak: Lucio, Herce ve Goicolea 2002*

Görüldüğü üzere bilgi kaynağının; endüstri içi uzmanlaşmada Porter dışsallıklarının rekabetçi bir yapıda gerçekleşti, MAR dışsallıklarının da eksik rekabetçi piyasalarda gerçekleştiği görülmektedir.

## 3 Endüstriyel Kapsam ve Ölçek Ekonomileri

Dışsal ekonomiler, işletmenin kendi faaliyetleri dışında bulunduğu mekânın sağlamış olduğu avantajların tümünü ifade etmektedir. Dışsallık bir bireyin üretimine veya tüketimine ilişkin bir faaliyetin bir başka bireyin fayda fonksiyonunu etkilemesidir. (Öztürk ve Uzun, 2010) Bu kavrama paralel olarak belirtilen durumun aynı şekli firmalar içinde geçerlidir. Eğer firmalar birbirleriyle ekonomik ilişkileri dışında sağlamış olduğu yarar var ise bu durum firmaların yakınlığından veya firmalar için ortak noktaların olmasından dolayıdır. Aksi takdirde firmalar ekonomik ilişkileri dışında negatif anlamda bir dışsallık yaratıyor ise; bu durumda firmaların mekân olarak uzaklığından ve birçok durumda ortak noktalarının bulunmamasından kaynaklanmaktadır.

Dışsallıklar içerisinde en önemli dışsallık bilginin yaratılması ve bilginin öğrenilmesi sonucu çıkan artan getiridir. Yerleşim yerinin üretim açısından başarısı o yöreye bağlı olan, öğrenmek için erişilmesi yakın olan ve girişimcilik kültürü ve sanayi tarihi ile ilişkisi olup üretilen bilgidir. Bu sayede işletme birçok işletmenin aynı yerde olduğu bölgede bulunuyorsa içsel ve dışsal ekonomilerden yararlanıp üretim maliyeti düşürme ve rekabetçi üstünlüklere sahip olabilmektedir (Eser ve Köse, 2005).

Firmalar birim maliyetlerini mekân içerisinde uzmanlaşmış hizmet şeklinde, elektrik, su, kanalizasyon gibi kamusal altyapı yatırımlarından yararlanarak, ortak bilgi alışverişinin sağlanması için oluşturulan bir birimden yararlanarak, teknoloji ve bilgi alışverişlerinden yaralanarak, fuar gibi etkinliklerinden yararlanarak, ürünlerin ortak pazarlamasını sağlayarak düşürebilmektedir. Ancak üretim maliyetlerinin düşük olması bu faaliyetlerin büyük ölçeklerde ve ortak mekânlarda yapılabilmesine bağlıdır (Eser ve Köse, 2005). Bu çerçevede yapılacak plan ve programlamalar dışsallığın maliyetler üzerindeki düşürücü etkisin ortaya koyacak ve üretim sürecinde firmalara bir avantaj yüklemiş olacaktır.

Dışsallık ve yığılma ekonomilerini içselleştirildiğinde; dışsal ekonomiler sonucunda endüstrilerde başka bir firmanın yaptığı yatırım nedeniyle kullanılan girdinin fiyatının azalması ile kalite yükselmekte, piyasa mekanizmasına girmeden yatırımlar kullanıldığından karlılık artmaktadır.

Diğer firmaların üretiminin artması sonucunda, maliyetlerinin azalmasıyla sağlanan faydalar yığılma ekonomileri olarak adlandırılmaktadır. İçsel bağlantılı bir ekonomide mal ve hizmet üretimlerinin yersel yakınlığından sağlanan yararlar olan yığılma ekonomileri, alansal yapının etkinliğini artırmakta, verimlik ve yenilik oranlarını yükselterek bölgesel ekonomik gelişmeyi hızlandırmaktadır. Yığılma ekonomilerinin varlığı nedeniyle coğrafi alanlarda oluşan sosyo ekonomik toplanma birimleri ise kentler olmaktadır (Kıymalıoğlu ve Ayoğlu,2007). Dışsallıklar çerçevesinde iki tip yersel yığılma ekonomisi tanımlanmaktadır: bunlar yerelleşme ekonomileri ve kentleşme ekonomileridir (Küçüker, 1998).

### 3.1 Yerelleşme Ekonomileri

Bir endüstri içerisinde bulunan endüstrilerin herhangi birinde toplam üretim arttığı zaman, firmaların üretim maliyetlerinin azalması halinde ortaya çıkana pozitif dışsallıklar yerelleşme ekonomileri olarak adlandırılmaktadır (Öztürk ve Uzun, 2010). Burada firma için dışsal fakat endüstriler için içsel avantajlar söz konusudur ve endüstride ölçeğin artması sonucunda ortaya çıkan avantajlardan yararlanılmaktadır. Bahsi geçen avantajların gerçekleşmesi için ön koşullardan bir tanesi yersel yakınlıktır. Yer olarak yakınlık ile ekonomik faaliyetlerin ortak olan koordinasyon maliyetleri azalmaktadır. Firmalar bu noktada yerelleşme ekonomilerinden yararlanmak için, ayni endüstri içerisindeki diğer firmalara daha yakın olan yerlerde mekân seçimi kararı almaktadır. Bu sayede üretim maliyetlerini azaltabilmek için ayni endüstri içerisindeki faaliyet gösteren firmalar, belirli bir bölgede kümelenerek ortak bir teknoloji, bilgi paylaşımı, piyasa bilgisine daha fazla sahip olma, beşeri sermaye içerisinde nitelikli işgücünün oluşumundan hizmet sektöründeki uzmanlaşmış faaliyetlerden faydalanma ve ortak bir altyapıyı paylaşma şeklindeki olanaklardan yararlanmaktadır.

Bunların piyasası oluşmadığı için, piyasa dışından bedelsiz olarak elde edilen bu avantajlar, sonuçta üretim maliyetini düşürmekte aynı zamanda da verimliliği artırmaktadır. Ara girdilerin üretimindeki ölçek ekonomileri, işgücü piyasaları ekonomileri veya iletişim ekonomilerinden kaynaklanan yerelleşme ekonomileri sonucunda, belirli bölgelerde belirli endüstrilerin toplanması gerçekleşmektedir. Bu sayede bölge cazip merkez haline gelmektedir.

Yerelleşme ekonomileri tam olarak; belirli bir endüstriyel faaliyetin coğrafi olarak yoğunlaşması olduğu için, bu endüstrilerdeki firmaların yersel yakınlık içinde bulunmaları özellikle kaynak tahsisindeki etkinlik açısından büyük önem taşımaktadır. Bu çerçevede yerelleşme ekonomilerinin egemen olduğu bir kentteki ekonomik yapı tanımda da bahsi geçtiği üzere belirli sayıdaki endüstrinin varlığı tarafından belirlenmektedir. Açıklamaya paralel olarak endüstriyel uzmanlaşma ekonomik yapının temel özelliği olma konumundadır. Şayet yığılma ekonomilerinde yerelleşme ekonomilerinin belirleyici ve egemen unsur olma konusunda bir fikir birliği sağlanması istenirse; bu durumda kentler belirli bir yapılanma üzerinde uzmanlaşarak büyümektedir. Kentin ekonomik yönden dinamizmi üretilen ürünler ile yerelleşme ekonomilerinin derecesine bağlı olmak zorundadır.

Kentlerin belli bir alanda uzmanlaşmasının sonucu olarak, ayni endüstri içinde bulunan ve birbirine yakın olarak yerleşen firmalarda kişi başına çıktı miktarı daha yüksek olmaktadır. Bu tip kentlerin açıklanmasında

dışsal ekonomilerin rolünün büyük olmasıyla paralel olarak benzer malları üreten çok sayıda firmanın oluşturduğu belli bir endüstri kentin uzmanlaşmak istediği alanda kurulmaktadır (Öztürk ve Uzun, 2010).

### 3.2 Kentleşme Ekonomileri

Kentleşme ekonomileri; bir şehrin oluşumu, işleyişi ve gelişiminin gerisindeki iktisadi güdüleri ve etkileri çözümlemeye çalışmasıyla bölgesel iktisadın, iktisadi karar birimlerinin davranışlarını mekânsal boyutuyla ele almasıyla ilgilenen iktisadi bir alandır (NND Sözlük, 2014).

Kentleşme ekonomileri sadece belli endüstrinin değil, bütün bir kentsel ekonominin büyümesinden kaynaklanmaktadır. Bu yönü ile yerelleşme ekonomilerinden ayrılmaktadır. . (Kıymalıoğlu ve Ayoğlu,2007) Kentleşme ekonomilerinin kapsadığı alanlar; büyük bir piyasanın oluşması, emek piyasalarındaki gelişmeleri, ticari ve finansman kurumları ile bankaların varlığı nedeni ile daha ucuz sermaye edinimi, ulaşımdaki iyileşmeleri, muhasebe, danışmanlık, reklâm şirketleri gibi uzmanlaşmış hizmet birimlerinden kolayca yararlanabilme olanakları, sosyal ve kültürel etkinlikler ile boş zamanları değerlendirebilmek için olanakların varlığı, kamu hizmetlerinde ölçek ekonomilerinin ortaya çıkışı, özellikle de artan talep ile birlikte enerji maliyetindeki azalmalar şeklindedir.

Kentleşme ekonomilerinin sağladığı avantajlar ise: Nüfusun ve ekonomik etkinliklerin belirli bir mekanda toplanması, işletmelerin ve yerel piyasanın büyümesi, ulaşım olanaklarının gelişmesi, tamamlayıcı sektörlerin oluşması, emek piyasasının büyümesi, finansal ve ticari kuruluşlar ile yardımcı hizmetlerin artması, bilgi iletişiminin kolaylaşması ve sosyal ortamın gelişmesi, yeniliklerin ve buluşların artması, yığışım sonucu, piyasaların potansiyel büyüklükleri artması şeklindedir (Goldstein ve Gronberg, 1984).

Piyasanın büyümesi ile bir yandan mamul ürünün taşıma maliyetlerini azaltırken diğer yandan, talep artışı yolu ile büyük ölçekli üretime yol açmaktadır. Maddelerden de anlaşılacağı üzere; firmaların burada bulunmalarının nedeni, yerel talebin güçlü olmasından kaynaklanmaktadır. Bir örnekle bu durum değerlendirilirse; bir şehirde belli bir sanayinin kurulup gelişmesi sonucunda çalışan sayısının, dolayısıyla yerel talebin artması ve şehir içinde diğer ekonomik faaliyetlerin canlanmasına yol açacaktır. Buna örneğe istinaden görüldüğü gibi yığılma ekonomileri içerisinde kentleşme ekonomileri belirleyici olduğu takdirde firmalar daha fazla endüstriyel çeşitlenmenin olduğu büyük kentlere yönelmektedir.

Aynı şekilde statik kentleşme dışsallıklarında da, eğer firmalar yerel talebin yüksek kentleşme ekonomilerinin yoğun olduğu yerlerde bulunuyorsa, farklı endüstriler içinde bulunan firmalar yakın yerlerde kurulmaktadır. Burada önemli olan nokta endüstriyel çeşitlenmenin kentin ekonomik örüntüsünün temel özelliği olmasıdır. Çok ürünlü firmaların sağladığı geniş ekonomiler gibi, tek ürünlü ama farklı endüstrideki firmaların sağladığı kentleşme ekonomilerinin etkinlik kazancının benzer nitelikte olduğu görülmektedir (Öztürk ve Uzun, 2010).

Yerelleşme ekonomilerinde bir firma aynı endüstri içindeki yerel firmalardan yararlanırken, kentleşme ekonomilerinde bir firma bütün bir kent ölçeğinden ve endüstri çeşitlenmesinden yararlanmaktadır. Her iki tip dışsallıkta da gelişmiş bölgelerde faaliyet göstermenin koşullu yararları söz konusudur. Kent ölçeği yığılma ekonomilerinin basit bir göstergesi olarak varsayılırsa, kentin ölçeği net yığılma ekonomileri pozitif olduğu sürece büyüme göstermektedir. Sonuçta, bölgeler arasında hiyerarşik bir yapı, bir yanda yerelleşme ekonomilerinin hâkim olduğu küçük ve orta çaplı yerleşimler, diğer yandan kentleşme ekonomilerinin hâkim olduğu büyük gelişmiş merkezler ortaya çıkmaktadır (Küçüker, 1998).

## 4 Organize Sanayi Bölgeleri ve Teknokentler

Geçmiş bölgesel çalışmalarda, sanayi bölgelerinin kurulmasındaki amaç; sanayiler arasında ileri-geri bağlantılardan hareketle büyük ölçekli sanayilerin kurulmasının bu sanayilerin diğer sanayilerde yaratacağı "çarpan etkisini de dikkate alarak, zayıf bölgelerin canlandırılması ve bölgelerarası dengesizliklerin en aza indirilmesi için yeterli görülmekte ve bu sanayilerin kurulması Organize Sanayi Bölgeleri (OSB) ve Küçük Sanayi Siteleri kurulması biçiminde devlet eliyle desteklenmesi şeklinde olmuştur (Eser ve Köse, 2005).

Bu sayede bölge ekonomilerinin canlandırılması için bağlantı etkileri ve girdi-çıktı ilişkileri güçlü kilit sektörler sanayiler özel ve kamu yatırımları politikalarıyla desteklenmiş, devlet destekli büyüme kutupları yaratılmıştır. Kuruluşlarının ilk yıllarında bölgesel gelişme politikalarında yeni teknolojileri geliştiren girişimcilik, firma ya da bölge düzeyinde rekabet edebilirliğin artırılmasına vurgu yapan yerel sanayi kümelerini oluşturma çabaları pek ortaya çıkmamıştır. Bu nedenle organize sanayi bölgelerinden tam olarak verim alınamamasının nedenlerinden birkaçı bu bahsedilen konular olmuştur.

Yakın dönemdeki bölgesel çalışmalar, zaman içinde yukarıdan aşağıya devlet eliyle kurulan bu sanayilerin çevrelerinde yeni sanayileri uyarmadıklarını ortaya koymaktadır. Herhangi bir bölgedeki kentin sanayileşmesi, girdi-çıktı ilişkisi ve sanayiler arasındaki iletişim etkilerinden çok, birbirini tamamlayan nitelikteki sanayilerin ortak bir mekânda olması ve coğrafi olarak kümelenmelerinden kaynaklanması pozitif dışsallıklara bağlanmaktadır (Eser ve Köse, 2005).

Organize sanayi bölgeleri ve tekno-Kentlerin önemli bir rol oynamasında girişimcilerin kar elde edebilecekleri üretim aşamalarının saptanması, üretimi gerçekleştirecekleri ürünün üretim ve pazarlama ile ilgili sağlıklı

bilgilere ulaşmaları ve kuruluş yeri seçimleri yer almaktadır. Organize sanayi bölgeleri ve teknokentlerin büyük önem arz etmesinde; sınaî yatırımları teşvik eden, bölge ekonomisine yeni üretim ve istihdam alanları gelmesine olanak veren, planlı yerleşim ve düzenli kentleşme sorunlarını çözmede önemli katkılar sağlayan organize sanayi bölgeleri ve teknokentler kamu ve özel sektör yatırımlarının uyum içerisinde bölgeye çekilmesi gibi faktörlerin etkisi açıktır. Organize sanayi bölgeleri ve teknokentler işletmelerin yer seçim kararlarını yönlendirmekte yığışım ekonomilerinin yaratılmasında ve kentleşme sürecinin biçimlendirilmesinde ve bölgesel dengesizliklerin giderilmesinde rasyonel bir mekân kullanım aracı olmaktadır. İşçilerin en verimli oldukları alanlara dağılımının OSB'ler içerisinde daha hızlı ve az maliyetle gerçekleşeceği açıktır. Çünkü bu alanlarda bilgiye ulaşım maliyetsiz ve neredeyse tamdır. Firmalar kendilerine en uygun çalışanı bulabilirken işçilerde en verimli oldukları yerlere yerleşmektedir. Bunun verimlilik ve etkinlik üzerinde önemli bir etkiye sahip olması gerekir. Bazı OSB'lerin işçilere eğitim verme gibi faaliyetleri de, gene ortak emek havuzun kullanımından sağlanan kazançlardan ortaya çıkmaktadır (Editör: Kök, 2010).

Özellikle eşyığılma ekonomilerinin önemli bir faktör olduğunun tanınması ve buna ilişkin ortaya konan ampirik kanıtlar; Ortak kulanım avantajı olan farklı endüstriler aynı bölge ya da OSB içerisinde toplanabildiğini, aynı türden emek ve girdi kullanan ya da benzer teknolojiler kullanan endüstrilerin aynı yerleşim yerinde olması eş yığılma ekonomilerinden dolayı tüm firmaların verimlilik ve etkinliğini artırdığını ve tek tip uzmanlaşma OSB'leri etkin olmayabileceğini gösterir. Yalnızca aynı endüstriye ait firmaların bulunduğu uzmanlaşmış OSB'ler etkin olmayabilirler. Özellikle girdi çıktı bağımlılığının olduğu endüstrilerin yakın yerleşmesi eş yığılma ekonomilerinde elde edilen kazançları artırır. Dolayısıyla tek tip uzmanlaşma OSB'lerindeki firmaların verimlilikleri eş yığılma ekonomilerinin harekete geçirilmesiyle artırılabilir (Editör: Kök, 2010).

Aynı sanayi dalında faaliyet gösteren firmaların birbirine yakın olmalarının yol açtığı bilgi, fikir ve deneyim alışverişlerinin sağladığı dışsallıkların yerel sanayilerin gelişmesi ve kentlerin büyümesindeki önemi büyük olabilmektedir. Bu noktada özellikle Organize Sanayi Bölgelerinde yapılması gerekenler konusunda son derece önemli ve kritik noktalar belirtilmektedir. Yukarıda belirtilenlerin hayata geçirilmesi durumunda Organize Sanayi Bölgelerinin işlevinin ne denli önemli olacağı açıkça görülmektedir.

## 5  Kentleşme ve Yerelleşme Olgusu: Yeni Ekonomik Coğrafya

Yeni Ekonomik Coğrafya kavramı tanımlanacak olursa; Doksanlı yılların sonunda ortaya çıkan ve artan getiri eksik rekabet gibi modellerin kullanılmasıyla birlikte ekonominin mekânsal özelliklerini de içinde bulunduran bir yaklaşımdır.(Kum, 2011) Yığılma ekonomileri ilk zamanlarda dışsal ekonomiler olarak algılanmış olunsa da bu kavram yerine yerelleşmiş ekonomiler kavramı kullanılmıştır. Marshallgil dışsal ekonomiler olarak firmaların mekânsal yoğunlaşmayı kârlı bulup belirli bir alanda yığılmalarının nedenleri; toplu üretim (kitle üretimi, içsel ekonomiler) ileri derecede uzmanlaşan işgücü havuzunun bulunması, uzmanlaşmış girdi hizmeti sağlayan firmalar ve taşıma imkânlarını da içeren modern altyapının varlığıdır ( Kıymalıoğlu ve Ayoğlu, 2006).

Bazı faaliyetlerin yerleşim yerleri olarak neden bazı bölgelerde yığıldığını ve özellikle ekonomik faaliyetlerin burada belirlendiği şeklindeki sorulara cevap arayan iktisadi bir alandır. Yeni ekonomik coğrafya olgusu özellikle 1990'ların sonlarında eksik rekabet, artan getiri kavramları modelleri ile bir yaklaşım olmuştur. Özellikle merkez-çevre modeli yeni ekonomik coğrafya yaklaşımının genel hatlarıyla açıklayıcı kısmını oluşturan bir model olmuştur. Bu modelde firma düzeyinde taşıma maliyetleri, artan getiriler ve faktör hareketliliği arasındaki etkileşimin nasıl ortaya çıktığına ve ne tür değişime sebep olduğunu açıklanmıştır (Krugman, 1999).

Yeni ekonomik coğrafya yaklaşımı gelişimindeki; eksik rekabet modellerinin oluşturulmasını sağlayan analiz aletlerini geliştiren yeni endüstriyel organizasyonun ortaya çıkması, söz konusu aletlerden faydalanarak artan getiriler durumunda uluslararası ticareti açıklayan dış ticaret teorisi, yeni büyüme teorisinin geliştirilmesi ve son olarak artan getirileri ve eksik rekabet modellerini kullanarak bu süreç içerisinde ekonominin mekânsal özelliklerini de dikkate alan yeni ekonomik coğrafya yaklaşımının gelişmesidir (Kum, 2011).

### 5.1  Yeni Ekonomik Coğrafyanın Gelişimi

Yeni ekonomik coğrafya olgusunda değinildiği üzere; yeni ekonomik coğrafya yaklaşımının gelişmesindeki dört aşamadan oluşan süreçler, iktisadi coğrafya alanındaki teorik ilerlemeler endüstriyel organizasyon literatüründe Chamberlin tipi monopolcü rekabet modelleri üzerine kurulmuş olan Dixit-Stiglitz modeli ile başlamıştır. Bu model ile birlikte eksik rekabet modellenebilir hale gelmiştir. Krugman'ın belirtmiş olduğu aşamalar içerisinde yer alan söz konusu aletlerden faydalanarak artan getiriler durumunda uluslararası ticareti açıklayan dış ticaret teorisi şeklindedir. Diğer bir aşama, yeni büyüme teorisinin geliştirilmesidir. Son aşama olarak ta 1990'ların sonunda ortaya çıkmış olan, artan getirileri ve eksik rekabet modellerinin kullanılarak ekonominin mekânsal özelliklerini dikkate alan yeni ekonomik coğrafya yaklaşımının gelişmesidir (Krugman, 1999). Özellikle yaşanan bu gelişmelerle birlikte küresel anlamda ekonomik yapının daha farklı boyutlara ulaşmasının farklı kavramları, modelleri beraberinde getireceği ve bunlar üzerinde çeşitli tartışmalara ve ortak noktaların saptanacağı açıktır.

### 5.2 Yeni Ekonomik Coğrafya Yaklaşımının Amacı, Kapsamı Ve Temel Özellikleri

Yeni ekonomik coğrafya modellerinin temel amacı tanımlarda da bahsedilmiş olan coğrafi mekânlarda meydana gelen çok farklı tip işletmelerin yer aldığı ve farklı ölçeklerdeki ekonomik yığılmanın (kümelenmenin) oluşumunu açıklamaktır. Bu çerçevede ekonomik faaliyetlerin yığılma veya kümelenmesi çok farklı coğrafi seviyelerde meydana gelebilmektedir. Örneğin bir tür yığılma küçük Show-room mağazasının ve fast-food işletmesinin komşu bölgede kümelenmesiyle ortaya çıkabilmektedir. Ayrıca farklı türde yığılmaların aynı ülke içerisinde güçlü bölgesel veya sanayileşme farklılıkları nedeniyle ortaya çıktığı da görülmektedir.

Ekonomik coğrafyanın beş kayıp geleneği bulunmakta olduğunu, bunların; Alman merkezi yerler teorisi, sosyal fizik, kümülatif nedensellik, yerel dışsal ekonomiler ve arsa kullanımı ve rantıdır. Krugman'a göre, sözü edilen beş kayıp geleneğin ileri matematiksel tekniklerle yeniden kurulması ekonomik coğrafyanın görevidir (Krugman, 1997). Bir ülkenin bölgelerinin nasıl merkez ve çevre olarak birbirinden ayrılabildiğini incelemiş, bölgelerin merkez-çevre olarak ayrılması taşıma maliyetlerine, ölçek ekonomilerine ve imalat sanayinin milli gelirdeki payına bağlı olduğu belirtilmiştir (Kum, 2011).

| Merkezcil Kuvvetler | *Pazar Ölçeği Etkisi |
| | *Yoğun Emek Piyasası |
| | *Saf Dışsal Ekonomiler |
| Merkez-kaç Kuvvetler | *Hareketsiz Üretim Faktörleri |
| | *Arsa Rantları |
| | *Saf Negatif Dışsal Ekonomiler |

**Tablo 2**. *Coğrafi Yoğunlaşmayı Etkileyen Kuvvetler* **Kaynak**: *Paul Krugman, 1999. : "The Role of Geography Development"*

Burada merkezcil kuvvetler olgusunu açıklamak gerekirse; dışsal ekonomilerin Marshallcı kaynaklarıdır. Geniş yerel bir piyasa için ileri ve geriye doğru bağlantılar yaratılabilmekte, geri bağlantılardan kasıt; ölçek ekonomilerine bağlı mal üretiminde daha geniş piyasalara daha kolay nasıl ulaşılır sorusuna karşılık mekânların seçilmesidir. İleri bağlantı ise; yerli üreticilerin açısından piyasada maliyetleri azaltarak ara mallarının kendi içlerinde üretiminin artırılması şeklinde tanımlanabilir. Özellikle uzmanlığa dayalı emek piyasalarında yoğunlaşılması endüstriyel yoğunlaşma açısından bir önem teşkil etmektedir. Çünkü bu tip bir emek piyasasında hem işveren açısından kolay işçi temini sağlanabilecek, hem de işçi istediği işverenle çalışabilecektir.

## 6 Kümelenme Olgusu

Günümüzde küresel boyutta ekonomik ilişkilerin üst düzeyde olması ve uluslararası piyasaların bir bütün haline gelmesi ile ekonomik anlamda etkinliklerin sürmesi açısından firmalar ve ekonomik birimlerin kümelenme ihtiyacını doğurmuştur. Kümelenme olgusunun geçmişte yapılan çalışmalarda düşmesi beklenirken günümüzde aksi bir sonuç ile karşı karşıya kalınmıştır. Global dünyanın işleyişi kümelenme olgusunun da artmasına sebep olmuş özellikle bilgi yayılması, teknoloji, beşeri sermaye vb. gibi kavramlar büyük önem kazanmıştır.

İktisat biliminde yaşanan gelişmelerde coğrafya faktörünün etkisi ile artan getirirler yatırımların ülke içi ve ülke dışı dağılımı doğrultusunda birtakım değişmelere yol açtığı ortaya çıkmıştır. Bunda teknolojilerin genellikle yerel faktörlere olan bağlılığı bir sebep olarak gösterilmektedir. Bu çerçevede özellikle yersel analiz açısından ulus devlet kavramı uygun ve anlamlı bir kategori olmaktan uzaklaşmakta ve onun yerine alt ulusal veya bölgesel-kentsel düzeylerde kavramlar önerilmektedir. Bu durum kümelenme kavramının önemini açıkça ortaya koymaktadır (Küçüker, 2012).

Diğer bir açıdan bakıldığında; kümelenme olgusu girişimci ve girişimcilik motifi üzerine küresel dünyanın da etkisiyle büyük bir devinim yeni bir çığır açmaktadır. Girişimcinin kendi kişisel artılarının dışında dış dünya ile yoğun bir ilişki içerisinde bulunması gerektiği bilinmektedir. Girişimcinin tek başına olmasının yetmediği durumlarda kümelenme olgusunun girişimciler üzerinde yapacağı olumlu etki hem girişimcinin kendisi üzerinde hem de firma üzerinde olumlu sonuçlar ortaya çıkabilmektedir. Olumlu sonuçların ortaya çıkabilmesi içinde devlet, özel sektör, girişimci üzerinde büyük bir koordinasyon gerekmekte, bu koordinasyon haricinde teknoloji, firma bazında yoğun bilgi paylaşımı, kişilerin iş bazında mesleki eğitimlerinin artırılması, devlet teşvikler, Ar-ge yatırımlarının yükseltilmesi vb. şeklinde durumlarında bir arada olması gerekmektedir. Bu çerçevede öğrenme ve örgütlenmeye dayalı ilişkiler artıp sosyal çevre, bilgi yayılması, girişimcilik, beşeri sermaye kavramları giderek önem kazanacaktır. Yapılacak bu koordinasyon sayesinde kümelenme olgusunun olumlu etkilerinin ortaya çıkması kaçınılmaz olacaktır.

Kümelenme olgusu ve coğrafi yakınlık ilişkisine değinilirse; kümelenme mantığının ana çerçevesini oluşturan birbiri ile yakın ilişkiler içerisinde olan işletmelerin belli bir yörede yoğunlaşması ile oluşan ve yaratmış olduğu iktisadi değerlere işletmelere katkıda bulunan yapı şeklinde yapılan tanım coğrafi yakınlığın önemini açıkça ortaya koymaktadır. Bu duruma paralel olarak, bir alan içerisinde aynı sektörde faaliyet gösteren işletmelerin belli bir alanda yoğunlaşması ve bu sektörde işletmelerin kendini geliştirmesi işletmeler arasında teknolojik

alanda ilerlemeye, bilgi paylaşımı açısından artışa, teknik ve idari yönden yeni avantajlara, verimliliğe ve en önemlisi öncü sektörün büyümesine neden olacaktır. Bu büyümeye dayalı olarak şehrin gelişmesine katkı sağlayacaktır. Devletin özellikle bu noktada rolü çok büyüktür; çünkü devletin en büyük amaçlarından biri olan ekonomik anlamda büyüme arzusu olması ve büyüme için lokomotif güç olarak bilinen işletmelerin durumu devlet için büyük önem arz etmektedir. Devletin özellikle teşvik ve çeşitli yardımları işletmelere doğru yapabilme gücünün de olduğu bilinirse; kümelenme olgusuyla iç içe olan işletmelere ve bu olgunun avantajlarını bilen devletin bu konuda önemli adımlar atmasını beklenmektedir. Yapılacak teşviklerin özellikle işletmeler açısından hayati bir önem kazanacağı görülmektedir.

Öğrenme süreci, teknolojik ilerleme ve bilgi paylaşımının kümelenme olgusu içerisinde ne derece önemli olduğu belirtilse de eğitim kavramının asla göz ardı edilmemesi gerektiğinin de unutulmaması gerekir. Ancak verilebilecek doğru ve sistemli bir eğitim sayesinde bahsedilen avantajlara sahip olunacağı da unutulmamalıdır.

Kümelenme olgusunun tam anlamıyla yasal bir tamamlayıcısının olmadığı belirtilmektedir. Aslında bu durum bireyin bir yasal dayanağın olmadığında bile neler yapabileceğini açıkça gösterebilmektedir. Bu durum firmalar arasında daha genel bir ifade ile bireyin güven duygusu ve işbirliği yeteneği ile neler yapabileceğinin göstergesidir. Farkında olmadan işletmeler açısından düşünülen bu olgu aslında insanın yaratılış itibariyle içinde olan duygu ve hissiyatlarında ortaya çıkmasına sebep olmaktadır.

## 7 Endüstriyel Yığılma Olgusu: Üç Teori

Şehirlerde olsun ya da başka bir coğrafi bölgede olsun yığılmadan kaynaklanan kazançlar nihai olarak taşıma maliyetlerindeki azalmayla ilgilidir. Bu açıdan eş yığılmadan elde edilen kazançlarla yığılmadan elde edilen kazançlar aynı niteliktedir (Editör: Kök, 2010).

Eş yığılmada farklı endüstriler birbirine yakın yerleşme eğilimi gösterir bu ise aynı endüstriden firmaların birbirine yakın yerleşimi olan yığılmadan kaynaklanan kazançların tüketilmesine eklenir ve yığılma ekonomilerinin daha büyük ölçeklere yayılmasına neden olur. Yığılma sonucu malların taşıma maliyeti, insanları taşıma maliyeti ve fikirleri taşıma maliyetlerinden tasarruf sağlanır (Marshall, 1920). Literatür bu üç faktörü, yığılmayı açıklayan ve daha geniş bir kapsamda üç yaklaşım olarak ele almıştır. Bu üç yaklaşım malları, insanları ve bilgiyi aynı yerleşim bölgesinde ortak olarak sağlayabilmekle ilgilidir ve bunlar üç girdinin taşınmasından tasarruf sağlar yani maliyetleri azaltır. Diğer bir deyişle verimliliği ya da etkinliği arttırır.

Mallar: Yığılma pazarlara ve girdi kaynaklarına yakın yerleşimle taşıma maliyetlerini azaltır. OSB'lerdeki ortak elektrik kullanımı, ortak su kullanımı, ortak arındırma sistemleri bu gruba girer.

İnsanlar: Yığılma emek piyasası paylaşımına imkân verir, aynı emek kullanımı kolay ve hızlı emek elde etmeye olanak verir, işçiler en etkin oldukları firmaya yerleşir.

Bilgi: Yığılma aynı OSB içerisinde bulunarak teknolojik ve diğer bilgilerin paylaşımına imkân verir.

## 8 Batı Trakya ve Gümülcine, İskeçe ve Dedeağaç Organize Sanayi Bölgeleri Örneği

Batı Trakya, Trakya Bölgesi'nin Yunanistan toprakları içerisinde yer alan bölümdür. Yunanistan'ın en kuzey bölgesi olduğundan Kuzey Yunanistan olarak da adlandırılmaktadır. Yunanistan'da yaklaşık 50.000 Türk azınlığın yaşadığı bölge olarak bilinmektedir. Ayrıca Organize Sanayi Bölgeleri üç şehre dağılmaktadır, buna göre Tablo 3 ve Tablo 4'de görüldüğü gibi örnekleme dahil olan firmaların %41'i Gümülcine %49'u İskeçe %10'uda Dedeağaç'ta kuruluş amacıyla paralel faaliyet sürdürmektedir. Yine bu faaliyetlerin %37 si gıda ürünleri ve yiyecek imalatı sektöründe ,%20'si ama metal sanayi sektöründe %11 'i Metalik olmayan diğer mineral ürünlerin imalatı sektöründe ve geri kalanı diğer sektörlerde faaliyet sürmektedir.

Burada yapılan faaliyetlerin bu çalışmanın amacıyla paralel ampirik bulgular ( ekonometrik modelleme ) ve bulgulardan hareketle yapılabilecek politika önermeleri konferans esnasında sunulacaktır.(Çalışmanın algoritma sonuçlarını yeniden test etmemiz gerektiğinden dolayı burada verilememiştir). Ancak bu seviyede, bölgenin özellikle Avrupa Birliği'nin ekonomik anlamda en geri kalmış bölgesi olduğu; teşvik programlarının uygulanması ile Sanayi Bölgeleri'nde bulunan firma sayılarının artabileceği, bölge insanının ekonomik krizlerden ve küresel gelişmelerden olumsuz etkilenmemesi ve refah kaybına uğramaması için Organize Sanayi Bölgelerinin OSB stratejisi ile paralel kalkınma stratejileri arasındaki uyumun gerekliliği ortaya çıkmıştır.

| Bölgeler | Kuruluş yılı | | | | | | | | | | Toplam | Yüzde(%) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | 1920-1930 | 1931-1940 | 1941-1950 | 1951-1960 | 1961-1970 | 1971-1980 | 1981-1990 | 1991-2000 | 2001-2010 | 2011-2014 | | |
| Gümülcine | 0 | 0 | 0 | 1 | 0 | 3 | 4 | 8 | 14 | 3 | 33 | 41 |
| İskeçe | 1 | 0 | 0 | 0 | 1 | 3 | 5 | 15 | 13 | 1 | 39 | 49 |
| Dedeağaç | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 7 | 1 | 0 | 9 | 10 |
| **Toplam** | **1** | **0** | **0** | **1** | **1** | **6** | **10** | **30** | **28** | **4** | **81** | **100** |

*Tablo 3. Örnekleme Alınan Firmaların Kuruluş Yıllarına Göre Frekans Dağılımı **Kaynak:** Tarafımızdan oluşturulmuştur.*

| Sektörler | Frekans | Yüzde |
|---|---|---|
| 15-Gıda Ürünleri ve içecek imalatı | 31 | 37 |
| 16-Tütün ürünleri imalatı | 0 | 0 |
| 17- Tekstil ürünleri imalatı | 4 | 5 |
| 18- Giyim eşyası imalatı; kürkün işlenmesi ve boyanması | 0 | 0 |
| 19- Derinin tabaklanması ve işlenmesi | 0 | 0 |
| 20-Ağaç ve ağaç mantarı ürünleri imalatı | 1 | 1,5 |
| 21-Kağıt hamuru, kağıt ve kağıt ürünleri imalatı | 1 | 1,5 |

# Переход Кыргызстана к социальной рыночной экономике: особенности, качество и пути к успеху

# The Transition of Kyrgyzstan to a Social Market Economy: The Features, Quality and Ways to Success

Prof. Dr. Turar Koychuev (National Academy of Sciences, Kyrgyzstan)
Prof. Dr. Merim Koichueva (Kyrgyz-Russian Slavic University, Kyrgyzstan)

## Abstract

The purpose of the study is to analyze the economic reform process of socialist economy and give them theoretical estimate over the past 20 years; to reflect the political, economic and social readiness of society to reforms; to point on the process of substitution of economic reform by political power struggle. The reforms had to initiated by economic sphere was held by government that consisted from the same political entity that was in Soviet period. The research methodology based on the principle of complexity and systemic, that reflects effects of historical, economic, social, cultural and educational factors of social development, the mentality of society, the scientific and theoretical level of labor on the processes of economic reform. The lack of experience in market economy pointed on largely insufficient knowledge of processes of market economy that developed economies had passed. The results of the study is identifying the opportunities for proper theoretical approach to the reform process, giving recommendations to society and the government to select real, positive economic policies that will contribute to the development and extending of modern economic outlook in the social environment.

## 1 Предыстория постсоветских экономических реформ

Историческим фактом увековечены в памяти Времен, Эпох 70–80-е годы советской экономики, когда по масштабам мощная экономика теряла свою эффективность функционирования, не находя способы коренного исправления ситуации.

Ресурсоемкая, научно-технически и технологически сравнительно слабо оснащенная, недостаточно интегрированная в мировую экономику, поскольку идеология и модели развития не были адекватными господствующим в мировом экономическом сообществе подходам, а, наоборот, противоречили им.

Конечно, государство искало пути, делало постоянно попытки поднять эффективность экономики и обеспечить её нормальное функционирование. Предпринимало и не раз меры по улучшению управления экономикой, системы планирования и стимулирования. Можно вспомнить передачу приоритета в управлении административно-территориальным органам, образовывая Совнархозы (1959–1965 гг.), «косыгинскую» новую систему планирования и улучшения стимулирования и возвращения к отраслевому принципу управления.

Но все эти и другие «новации» «заканчивались» ничем, проваливались, потому что у руля их проведения стояло авторитарное, партийно диктаторское бюрократическое руководство. Власть осуществляла реформы, а хозяйствующие субъекты были лишь исполнителями «без права голоса». Решения были волевыми, «силовыми». Казалось, решительным, бескомпромиссным будет подход к реформированию в 1989–1991 гг., когда намечались обновляющие меры: разгосударствление, приватизация, ввод рыночных механизмов, предоставление свободы хозяйствования экономическим субъектам и т.д. Для разработки программ привлекались лучшие научные силы страны. Шло широкое обсуждение альтернативных программ. Даже была составлена комиссия по «примирению» альтернативных подходов и выработке рекомендации к принятию согласованного проекта. Но, ни рассмотрения на Пленуме ЦК КПСС и принятия соответствующего решения, ни постановления Советского правительства не произошло. На Пленуме ЦК КПСС были приняты ни к чему не обязывающие рекомендации-пожелания, т.е. практически вся проделанная, подготовленная работа по реформированию была «похоронена». Почему советская власть не решилась на решительный шаг? И в чём состояло обновление?

Оно состояло в смене экономической основы существующего коммунистического политико-правового устройства государства – в отходе от господствующей общенародной (государственной) формы собственности на средства производства и признании различных её форм: и общенациональной, и преимущественно частной, естественной в условиях рождающейся свободы рынка взамен директивному планированию.

То есть политическая и государственная власти коммунистической системы теряли под собой материальную экономическую почву. Поэтому советская власть не решилась на окончательный «самоубийственный», радикальный шаг. А страна катилась к экономическому коллапсу.

Разумеется, экономические сложности не способствовали стабильности в стране. Союз Советских Социалистических Республик «трещал по швам». Произошли конфликтные, трагические ситуации в Азербайджане (Сумгаит), Грузии (Тбилиси), Латвии (Рига). Усилились сепаратные течения в политике, пошло предъявление счетов друг другу. Беспомощная попытка склеить швы введением президентства в союзных республиках подвела существование союзного государства к критической черте – развязке. Трагикомедия – в одном государстве один Союзный президент и 15 президентов республик. В здравом уме не укладывается, казалось, такое. Оказывается, возможно, но гибельно. Оставалось только зажечь спичку.

Экономическое движение вниз по наклонной,уже отсутствие спаянности между союзными республиками сопровождалось шумной, площадной, лозунговой демократизацией общественного развития, когда не мировоззренческие ориентиры, осознанные цели и задачи направляли энтузиазм и интересы масс. Господствовал безумный подход: «цель – ничто, движение – все!». Хоть куда. О здоровом, позитивном направлении не думалось митинговым демократам.

Потом грянул экономический кризис. В Беловежской пуще Б. Ельцин, Л. Кравчук, С. Шушкевич «зажгли спичку»: своими подписями ликвидировали СССР. Никто из президентов других союзных республик не выступил с заявлением о не конституционности Беловежского произвола. А, ведь, незадолго до этого (весна 1990 г.), Всесоюзный референдум гласил о желании народов СССР жить в едином союзном государстве. Экономический кризис, распад государства, переход к экономической реформе не состоялся. Это – финал существования СССР.

## 2 Оценка опыта постсоветского реформирования

Как видно вышеизложенной предыстории, реформы уже независимых государств начались в жесточайших экономических, политических и социальных условиях.

Разгромленная экономика с разорванными экономическими связями в рамках Союза, а иные связи с более широким кругом были для республик весьма ограниченными.

Жесточайший экономический кризис 1991–1995 годов. Спад экономики. Практически неуправляемая экономика. Материальная база растаскивалась.

Голод на инвестиции. Распад СССР и разрыв единого союзного пространства сломал единую систему управления со связанными инвестиционными потоками. Республики лишились централизованных источников капитальных вложений.

Уровень жизни населения резко упал. Появилась масштабная безработица. Увеличилась бедность населения. Появились люди, живущие в условиях крайней нищеты. Возросло социальное расслоение населения по доходам.

Вновь рожденной, признанной общественной идеологии ещё нет. Коммунистическая из общественного сознания и общественной психологии не выкорчевана ещё. Будоражат некоторые отголоски различных идеологических недозрелых течений. Но всё это не политический плюрализм. Идеологический хаос! Партии стали возникать как грибы на дрожжах. Все за декларативную демократию, но, непонятно, какие социальные группы представляют, какие программные цели преследуют. Количество партий многократно превышает количество имеющихся социальных групп и количество возможных на национальном уровне целей и задач.

Но кто у руля власти? Во многих странах вчерашние государственные и партийные руководители советского периода. Политическую демократизацию и рыночную экономику осуществляют они, апологеты коммунистической идеологии. Быстро поменяли кресла. Реформа была проведена сверху, действовавшей властью, только вчера тормозившей её начало. Пользуясь властью и доступом к ресурсам, бразды правления взяли в свои руки. Политическая система государства была принята не народом, а народу представлена не новой, а старой властью. И «могильщики» коммунистической системы, и лидеры новой демократической системы оказались одними и теми же лицами. Они провели реформы для себя, для собственного самосохранения. Кто сегодня в составе состоятельных лиц страны? Это они же и приближенные к ним. Они, только они имели доступ к ресурсам при неконтролируемой и криминальной приватизации. Они сегодня – мощный клан, преследующий исключительно корыстные интересы.

Патриотической власти, отстаивающей интересы страны и народа почти нет. Свидетельством этого служат происходившие «революции», государственные перевороты в Азербайджане, Украине, Грузии, Кыргызстане.

Неустойчивый рост экономики, социальное резкое расслоение обуславливают политическую и социальную нестабильность. Для примера можно ограничиться одним фактом – непрекращающимися террористическими актами в России.

Сегодня постсоветские независимые государства в своем экономическом развитии от развитых стран отстают ещё больше, чем до распада СССР – до 1991 года. Практически в 1996–2014 годы они восстанавливали объем экономики 1991 года, тогда как развитые страны поднимались всё выше и выше. Таким образом, отставание постсоветских стран прирастало.

Структурно экономика потеряла былую свою комплексность, устойчивость, сбалансированность, а новую приоритетную структуру ещё не приобрела.

Так что же получается: экономическая реформа и приобретение суверенности не принесло ничего позитивного в плане политическом, экономическом, социальном?

Если учитывать вышеизложенное положение, то общественно-экономические перемены обернулись многими и большими негативами.

При оценке крупных общественных перемен важно правильно выбрать критерии оценки в историческом ключе. Что же исторически значимого произошло?

Во-первых, покончено с диктатом коммунистической идеологии и сломана авторитарная государственная машина. Утвержден политический и экономический плюрализм! Сосуществуют политические партии во власти, а в экономике общегосударственные решения сочетаются со свободным рынком и частными формами собственности.

Во-вторых, этносы, представлявшие союзные республики, получили полную независимость, используя право на самоопределение, чтобы самостоятельно открыть свою судьбу без диктата сверху.

В-третьих, в условиях политической демократии и свободной, социальной экономики каждый член общества, используя свободы и права граждан, может больше реализовать свои способности, усилия и возможности.

Как говорится, игра стоила свеч!

Постепенно, последовательно шаг за шагом постсоветские страны делают успехи в достижении цели – создания благополучной экономики и обеспечения народного благосостояния. Важно не споткнуться и преодолеть барьеры.

Все независимые государства входили в состав СССР и поэтому «переболели» всеми издержками его экономики и коммунистического мировоззрения. Переход к совершенно другой экономической идеологии, отсутствие собственной глубоко разработанной теоретической базы и отсутствие опыта работы, образовательная неподготовленность населения обусловили невысокое качество реформ, что сказалось в подходах к реформам, принимаемых решениях, ошибках и, как результат, в неудачных результатах. Из всего пройденного важно извлечь уроки.

## 3   Какие задачи нужно решить?

Безусловно, нужно будет решить широкий круг экономических, социальных, экономических, научно-технических и других проблем. Вне сомнения. Но, чтобы их реализовать, необходимо построить эффективную систему управления, тщательно продумать принципы и порядок её формирования. Она должна быть прагматичной и действовать в функционировании, доступной и открытой для диалога с гражданским обществом. Сильная экономика, благополучие народа, целостность и безопасность страны, политическая стабильность и социальная солидарность, экологическая безопасность и общественный правопорядок, и нравственный климат – вот задачи государства.

Нравственный, социально-психологический климат –важнейшее условие жизнедеятельности страны.

Поэтому надо устранять действия, противодействующие благожелательному социально-психологическому климату.

Необходимо изжить в любой форме клановость при формировании властных кадров на всех уровнях управления. Критерии должны быть: знания, профессионализм, опыт, моральная и нравственная чистота.

Пора развернуть масштабную и результативную борьбу с коррупцией и искоренить её как заметное социальное явление.

Государственные структуры надежно не освоили и не усвоили финансовые рычаги регулирования экономики в условиях рынка. Надо устранить пробел. Государственные «мужи» постоянно должны учиться.

Государство, используя различные виды, должно привлечь все бизнесструктуры и население экономическому и правовому «всеобучу». В советское время весьма интенсивно работало, в целях просвещения населения, общество «Знание». Можно же нечто подобное создать!

И, наконец, надо вселить в умы и души народа надежду, веру в будущее: дать, пусть приблизительный прогноз (в прогноз всегда таков, с меньшими или большими отклонениями от реально возможного): что ожидает нас в ближайшем и отдаленном будущем; как будем выглядеть в мировом содружестве. В целях их достижения, какими должны быть действия наши и наших потомков, будущих поколений. Без взгляда о будущем наши сегодняшние действия бесполезны, а без наших сегодняшних действий нет основ будущего. Память о прошлом вдохновляет к прогрессу. Без прошлого нет настоящего, без настоящего нет будущего. Прошлое, настоящее, будущее – нерасторжимое единство!

## 4 Особенно об экономике Кыргызстана

Каждого из нас, кто родом из бывшего Советского Союза, волнует судьба нынешних суверенных государств. Сопричастность, солидарность, сочувствие, поддержка друг друга в душе сохранились навсегда.

Но, каждого из нас особо волнует судьба собственной страны. В данном случае, мы, граждане Кыргызской Республики, озабочены её социально-экономическим состоянием и политическим положением.

Среди стран СНГ по объему ВВП в 2011 г. Кыргызстан занимал последнее место, по темпам роста ВВП в 2011 г. к 2001 г. – предпоследнее место. По размерам ВВП на душу населения (1073 долл.) ниже, чем в КР, только в Таджикистане – 855 долл. По данным Всемирного Банка находится в числе отсталых и беднейших стран. Политическая и социальная ситуации в стране нестабильны.

За 23 года независимости, республика пережила два государственных переворота. Были смещены первый и второй Президенты. Постоянными стали социальные конфликты, выраженные в митингах, пикетах, перекрытиях дорог и т.д.

Уровень жизни населения низкий.

Во властные структуры проникают не патриоты страны, а жаждущие личных целей корыстные, нечистоплотные лица. Расцветают подкуп и продажа должностей, коррупция на всех уровнях власти. Моральный климат гниёт с верхних этажей до низу. Растет преступность. Нравственный, духовный уровень населения падает. Знание и образование не в цене. В цене - нечестно заработанные деньги.

Если хотим сохраниться как независимое государство, мы должны определить действенную, теоретически взвешенную собственную модель экономического и политического развития, привлечь к власти образованных, профессионалов и нравственно чистых, подлинных патриотов.

Не щадя «живота» отдавать себя экономическому, социальному, политическому возрождению страны. Беспощадно бороться с коррупцией.

Мы надеемся на поддержку мирового сообщества.

Кыргызстан – не заброшенный и не непригодный для жизни участок Земли. Страна гор, вод и степей богата природными ресурсами. Население образованное. Обладает достаточным экономическим потенциалом, который может стать базой для рывка.

Можно было бы призвать, обратиться к крупным международным научно-образовательным организациям, экономическим фондам и туристическим кампаниям, финансовым учреждениям, – с учетом благоприятных природных ресурсов: красивых и щедрых, уникальных и разнообразных, возможных к использованию во все времена года, наличия научных и образовательных и оздоровительных учреждений, экологических и туристических баз, специалистов соответствующих профессий и ресурсов труда, которые могут быть привлечены для работы, – создать в Кыргызстане Международный научно-образовательный, эколого-наблюдательный и испытательный, туристически-оздоровительный Центр. Такой Центр имел бы мировое значение и был бы серьезной поддержкой имиджу Кыргызстана и вносил бы заметный вклад в экономику страны.

Страна и народ должны достойно заявить миру о себе.

# Национальные интересы и евразийская экономическая интеграция

# National Interests and Eurasian Economic Integration

Prof. Dr. Khodjamakhmad Umarov (Institute of Economics, Tajikistan)

## Abstract

Integration processes, both on global and on regional levels faced serious barriers. Research of these barriers shows that they are connected with irreversible nature of integration processes. The last 30 years behind some exceptions these processions consisted an essence of economic globalization and regionalization trends. Economic integration was focused on realization of small group of oligarchs and the state bureaucrats' interests. Such orientation with inevitability brought into an impasse which can be explained as the serious crisis phenomenon. In the report the assessment of influence of interests on economic integration is given. Only national interests can appear as influential socio-economic factor of integration processes development. The fullest implementation of national interests directs integration processes on the way of creation of necessary vital conditions for the vast majority of the population. It is, especially, important for the Euroasian space where labor segments of the population occupy the main part of the population and where inertia of the Soviet system is still felt in the economy sphere. Very important is the question of conceptual bases of the Euroasian economic integration. Latter is based on ideology of neoliberal economic school. Development of integration processes in line with a certain neoliberal theory can lead to structural degradation of economy, to transformation of economy of the countries of EuroSEC in mineral and raw appendage of the developed countries. The same situation possible to see in other economic unions of Asia, Africa and Latin America countries.

Проблемы экономической интеграции ныне стали объектами интенсивных обсуждений на различных уровнях. Ведущих теоретиков в области экономической интеграции объединяет общее мнение о том, что интеграционные процессы во всем мире столкнулись с серьезными преградами. Кое-где эти процессы превратились в свою противоположность. Во всех странах мира идут творческие поиски причин кризиса в интеграционных процессах и пути выхода из него.

Кризис европейской интеграции стал еще одним свидетельством уязвимости существующих моделей региональной экономической интеграции. Этот кризис косвенно показал и самые уязвимые места экономической глобализации. В последние 10 лет во всем мире идут разоблачительные процессы относительно сомнительной эффективности процессов глобальной и региональной интеграций.

Глобализация привела к углублению различий в уровнях социально-экономического развития развитых и развивающихся, а также переходных стран. Региональная интеграция также не оправдала себя и это находит самое яркое проявление в углублении противоречий между членами различных экономических союзов и объединений, увеличение угроз дезинтеграций региональных экономик. Еврокризис является самым ярким доказательством того, что такие угрозы приобретают все более реальные черты. Предотвращение бегства капиталов из стран, которые оказались в трудном положении, а также политические решения об их выходе из интеграционных объединений уже привели к огромным финансовым потерям для ведущих членов таких объединений. Об этом свидетельствуют попытки удержания Греции в Евросоюз, которые обходились европейским налогоплательщикам очень дорого (Более подробно см.: Financial Express, 2 May, 2012).

Нобелевские лауреаты Дж. Стиглиц, П. Кругман, известный норвежский профессор Эрик С. Райнерт и др. неоднократно говорили об ошибках, допущенных глобальными финансовыми институтами, как в осуществлении реформенных процессов, так и в продвижении экономической интеграции в мировом масштабе. В особенности, резкая критика прозвучала в адрес МВФ и документа под названием «Вашингтонского Консенсуса».

Однако, многие ученые – экономисты развитых стран замалчивают о политической направленности вышеотмеченных процессов. Последние не просто носили узкоэгоистичный характер и были направлены на утверждение безраздельного господства ТНК в мировой экономике. Более того, как глобальные, так и региональные экономические институты были ориентированы на укрепление социально-экономической зависимости развивающихся и переходных обществ от развитых стран. Если очистить эти отношения от неолиберального словословия, то можно увидеть процессы формирования отношений «метрополии-колонии» применительно к XXI веку.

Главная причина обострения противоречий внутри региональных интеграционных объединений заключается в несовпадении интересов их членов. В условиях же мирового финансово-экономического кризиса такое несовпадение проявляется в обострении противоречий между членами этих объединений.

Если систематизировать интересы каждого члена регионального союза или объединения, то воочию можно увидеть насколько разнятся эти интересы. Интеграционные объединения оказались неспособными к гармонизации социальных и экономических интересов отдельных стран, входящих в них. Например, Белоруссия заинтересована в том, чтобы успешно реализовать свою машиностроительную продукцию, а также продукцию сельского хозяйства во всем пространстве ЕвраЗэс, в то же время она стремится удовлетворить свои потребности в углеводородных ресурсах исключительно путем развития отношений с Россией. У Таджикистана, который расположен в другом конце пространства ЕвраЗЭС имеются совершенно другие интересы. Тем не менее, они находятся в составе одного интеграционного объединения. Отсюда возникает вопрос, насколько Белоруссия заинтересована в реализации интересов Таджикистана. Аналогичные вопросы возникают и в отношении других региональных союзов.

Экономические реформы в последние 20 лет были нацелены на решение двух сугубо политических задач: а) покончить с социализмом окончательно; б) зависимость развивающихся и переходных обществ от развитых стран сделать необратимым.

Позитивное решение этих задач в полной мере соответствует интересам США и развитых стран Запада. Для того, чтобы сохранить роль единственной сверхдержавы необходимо было экономически расслаблять конкурентов, и прежде всего Россию. Неолиберальная теория могла бы служить успешному решению данной задачи. На помощь советникам по рыночному реформированию постсоветского пространства пришла слегка измененная концепция «невидимой руки» Адама Смита. Господство рыночного регулирования экономики стало бы фактором деиндустриализации и примитивизации экономики, преобладания сырьевых отраслей и деградации человеческого капитала.

Как было отмечено, нынешний глобальный финансово-экономический кризис, и кризис региональных интеграционных процессов органически взаимосвязаны и имеют одну общую причину, которая заключается в отсутствие их ориентации на развитие человеческой личности. Они во-первых, нацелены на более полное удовлетворение эгоистичных потребностей мировой бизнес-элиты; во-вторых, на сохранение социально-экономической отсталости развивающихся и переходных обществ. Этот курс в течении последних 20-25 лет был осуществлен под воздействием экономической политики США и других развитых стран, которая всецело опиралась на идеологию неолиберальной экономической школы. Эта школа, как известно, отрицает интересы развития человеческой личности, поскольку последние не совпадают с идеей свободной торговли. Последняя вытекает из рикардианской концепции сравнительных преимуществ. Приспособленная к условиям XXI века названная концепция посредством развития свободной торговли приводит к обострению конкуренции, в результате которого одна часть света оказывается в роли победителя, другая часть - в роли побежденного, которого глобальные финансово-экономические организации заставляют согласиться с условиями игры предлагаемого победителем. Эти условия, носителем которых является ВТО, отрицают интересы развития человека и человечества, 3/4 которого проживает в развивающихся и переходных обществах.

Новейшая история экономической интеграции содержит успешные примеры ориентации региональных союзов на развитие человеческой личности посредством осуществления идеи выравнивания уровней экономического и социального развития отдельных стран. Наиболее ярким подтверждением такой идеи является деятельность Совета Экономической Взаимопомощи – интеграционного объединения, в которое входили большинство социалистических стран и действовавшее до начала 90-х годов прошлого века. Этот экономический союз особое внимание уделял подъему экономики стран, которые характеризовались технико-экономической отсталостью и низким уровнем жизни населения. По отношению к таким странам разрабатывались и осуществлялись соответствующие программы, которые финансировались из централизованных фондов СЭВ. В результате реализации таких программ за относительно короткий промежуток времени экономика Монголии стала носить промышленно-аграрный характер. Сама Монголия вошла в список стран со средним уровнем развития, а уровень бедности сводился почти к нулю.

Однако, после распада социалистической системы и СЭВ, и в результате последовательного осуществления неолиберальных реформ экономика Монголии была отброшена в исходную позицию, промышленность была уничтожена, а сельское население, в своем большинстве вернулось к кочевому образу жизни.

То же самое относится и к ранее отсталым, в экономическом и культурном отношении, республикам бывшего Советского Союза. Речь, в частности, идет о Таджикистане, Туркменистане и Киргизстане. Союзное государство еще в 20-30 гг. XX века осуществляло крупномасштабные мероприятия по ликвидации многовековой технико-экономической отсталости этих республик. К началу 60 гг. по всем основным показателям своего развития названные республики достигли среднего уровня, присущий всему Советскому Союзу. По уровню грамотности и других показателей образования народы этих стран поднялись на самые высокие рубежи, достигнутые в мире. К сожалению, рыночные реформы привели к быстрому ухудшению показателей развития человека и экономики в постсоветском пространстве.

В последние годы стало очевидным, что идеология постсоциалистических региональных объединений не нацелена на повышение уровня жизни населения и каждое объединение или союз имеют свою специфическую цель, в зависимости от сочетаемости целого ряда интеграционных факторов. Кроме того само географическое расположение отдельных стран оказывает воздействие на их позицию внутри каждого интеграционного объединения. «Учитывая реальную ограниченность положительного воздействия РИС (региональные интеграционные союзы) на благосостояние стран – членов, а также тот факт, что создание РИС с одной группой партнеров препятствует или, по меньше мере, осложняет создание такого партнерства с другими странами, мы не можем рассматривать вопрос о причинах привлекательности РИС в отрыве от вопроса о том, кто в них входит.» (Шифф Морис и Уинтерс Л. Алан., 2005.). Эти слова являются подтверждением двух наших предположений отмеченных выше. Об этом например, свидетельствует накопленные за последние 20 лет опыт вхождения Таджикистана в такие интеграционные союзы как СНГ, ЕвраЗЭС, ШОС и ЭКО. Если подходить к членству Таджикистана в названных союзах с позиций их воздействия на рост уровня народного благосостояния, то можно смело утверждать, что такое воздействие имело очень скромные результаты. Членство в региональных интеграционных объединениях не представило Таджикистану возможность решить свои жизненно важные проблемы. Речь идет о таких проблемах, как серьезные помехи, создаваемые для транзита таджикских грузов со стороны Узбекистана, барьеры, возведенные названной страной относительно строительства Рогунской ГЭС и каскада Зерафшанских ГЭС и т.д. И СНГ, и ЕвраЗЭС, и ШОС к этим вопросам проявили безразличие.

ЕвраЗЭС, как и все другие экономические блоки организует свою деятельность на основе неолиберальной теории свободной торговли. Механизмы ее реализации сконструированы таким образом, что исключают равную конкуренцию. Какая может быть равная конкуренция, если между экономическими блоками, да и внутри них действуют неравные условия в применении инноваций, в использовании квалифицированной рабочей силы, в уровнях технической оснащенности производства. Известный индийский исследователь Нирадж Джейн в связи с этим ироническим тоном пишет: «Доктрина свободной торговли всегда предполагает: дисциплина рынка для тебя, но не для меня, пока «игровое поле» не передается в мое пользование. Англия была крупнейшим сторонником свободной торговли в XIX веке, когда половина мира состояло из его прямых и непрямых колоний.

Сегодня с одной стороны США и их приспешники, Европейский союз и Япония используют такие международные соглашения как Марракешский Договор 1994 года, чтобы форсировать открытые рынков стран третьего мира для их экспорта. С другой стороны, они прибегают к всякому рода средствам, явным и неявным, чтобы предохранить свои собственные рынки от массированного дешевого экспорта товаров недоразвитых стран» (Jain Neeraj, 2007). Это в полной мере относится и к отношениям между региональными интеграционными союзами, которые отличаются различными уровнями социально-экономического развития. Это в полной мере относится и к отношениям между региональными интеграционными союзами, которые отличаются различными уровнями социально-экономического развития. Например, отношения между НАФТА и Меркосур, Европейский Союз и ЕвраЗЭС в области торговли характеризуются именно описанным выше подходом. Кроме того, внутри каждого регионального блока выделяются страны, которые всецело определяют политику блока и страны, которые призваны слепо следовать за ними. Примером первой группой стран является Германия, второй группой стран – Кипр и Греция. Идея Европейского Союза не предполагала выравнивание уровней экономического и социального развития членов этого интеграционного объединения. Логически сама идея свободной торговли исключает всякие попытки более ускоренного развития отсталых стран и регионов. Поэтому центрально-азиатские страны за исключением Казахстана весьма творчески должны относится к предложению о вступлении в Таможенный Союз. Этот союз, в который пока входят Россия, Беларусь и Казахстан постепенно трансформируется в Единое Экономическое пространство. Однако, если нынешние рыночные принципы функционирования названного союза сохранятся и в будущем, то Таджикистан от членства в нем только проигрывает.

Кроме того, политика экономических блоков в отношении друг к другу также опирается на неолиберальные концепции. Экономические сообщества развитых стран, как принято, диктуют региональным интеграционным союзам состоящих из средне-развитых и слаборазвитых стран свои условия игры. По сути дела эти отношения незначительно, по своим моральным аспектам, отличаются от отношений Британии и Запада к торговле с Китаем, которое в 1781 году привело к Опиумной войне.

Вплоть до 1830 года торговля опиумом была самой крупной статьей в мировой торговле. Это был первый эксперимент свободной торговли (Saul J. Ralston, 2005). К сожалению, в настоящее время Китай, некогда пострадавший от торговли опиумом экспортирует в массовом порядке потребительские дешевые товары и тем самым способствует разрушению промышленности Кыргызстана, Таджикистана и других стран.

В последние годы расширяется специализация между интеграционными объединениями развитых стран, с одной стороны, развивающихся и переходных стран – с другой. Первые продают знания,

новейшие технологии и другие инновационные продукты за монопольно высокие цены, а вторые специализируются на продажу в мировом рынке минерально-сырьевых товаров за монопольно низкие цены. Ярким свидетельством описанной ситуации являются торговые аспекты режима ТРИПС (право на интеллектуальную собственность) в рамках ВТО. Другим примером может выступить государственная поддержка сельского хозяйства, проводимая западными странами, которая уже привела к деградации аграрного сектора развивающихся стран. Евросоюз и НАФТА очень умело используют вышеназванные инструменты в отношении не только отдельных стран, но и региональных интеграционных союзов развивающихся и переходных стран.

Интересно отметить, что внутри своих блоков ведущие члены НАФТА и Евросоюз не используют принцип «невидимой руки» и прибегают к широкому использованию методов государственного регулирования экономики. В то же самое время они требуют от постсоветских стран целиком полагаться на господство рыночных методов регулирования экономики. «Даже смитовская теории «невидимой руки», которая была релевантна применительно к развитым индустриальным странам, - отмечает лауреат нобелевской премии Джозеф Стиглиц, - далеко не удовлетворяет развивающиеся страны, которые считают непригодными вытекающее из нее условия. Рыночная система требует конкуренцию и совершенную информацию. Однако, конкуренция ограничена, а информация очень далека от совершенства – и хорошо функционирующие на конкурентной базе рынки не могут быть организованы быстро» (Stiglitz Joseph E., 2003). Все это случилось в СНГ и ЕврАзЭС, и по этой причине они полностью потеряли свою привлекательную силу.

Одним словом, отношения между экономическими блоками, составленными из развитых, развивающихся и переходных стран в своем нынешнем виде с неизбежностью приводят к восстановлению экономического колониализма. Имеются много косвенных признаков подтверждающих, что дело обстоит именно таким образом. Об этом говорят данные о структуре прямых иностранных инвестиций в центрально-азиатских странах. Согласно этим данным инвестиции развитых стран Запада и КНР в экономику Таджикистана, Киргизстана и Казахстана на 73-85% направляются в минерально-сырьевые отрасли. Если даже прямые иностранные инвестиции направляются в развитии обрабатывающей промышленности, то они используются преимущественно для производства промежуточного продукта типа пряжи, хлопкового и шелкового волокна и т.д.

Такое же поведение присуще международным финансово-экономическим организациям (МФЭО). Ни ВТО, ни Всемирный Банк, ни МВФ, ничего реального не предлагают для подъема экономики отсталых стран, для их реиндустриализации, для осуществления глубоких структурных изменений в экономике этих стран с целью эффективного решения самых серьезных проблем социально-экономического развития с которыми они сталкиваются. Они дают такие рекомендации развивающимся и переходным обществам, которые находя воплощение на практику сулят негативный эффект, т.е. дают противоположные результаты.

В качестве примера можно привести рекомендации с одного издания, принадлежащего Всемирному Банку. Устами автора Гарри Броудмена в этом издании задается вопрос – «каким образом открытая торговля ускоряет развитие и снижает бедность в регионе? Развитие торговли в свою очередь, оказывает влияние на развитие через торговую политику. Полезный эффект торговой политики на бедность через его воздействие на развитие представляется сложным процессом. Механизм воздействия носит не прямой характер и показывает свои результаты только после относительно продолжительного времени. В то же самое время, результат торговой политики в относительных ценах, которые имеют влияние на благосостояние бедных, могут выразить себя через занятость и рост доходов, а также через цены на товары, которые ими потребляются» (The World Bank, 2005).

Такие рекомендации отличаются слабой аргументированностью, поскольку они не охватывают структурные сдвиги, которые несет в себе торговля и которая является выражением соответствующих изменений в производственном секторе. Они обходят вопрос о конкуренции между фирмами из развитых и развивающихся, а также переходных стран в мировом рынке, поскольку их авторы дают себе отчет в том, что конкуренция в условиях неравенства технико-экономических условий функционирования фирм несет в себе разорение и разрушение. В более широком плане такие результаты присущи торговым отношениям между региональными интеграционными союзами, которые включают в себе развитые и развивающиеся страны в отдельности.

Таджикистан испытывает на себе тяжесть высоких цен на товары, поступающие из Западной Европы, которые в основном носят инновационный характер. Степень их тяжести растет из-за того, что в самой Центральной Азии в течении продолжительного времени не прекращаются дезинтеграционные процессы. Нередко, такие страны, как Кыргызстан и Таджикистан, которые относятся к категории бедных стран, не имея возможности покупать новые технология из Европы уповают лишь на гуманитарные поставки некоторых видов техники (в частности, для здравоохранения и образования) или на машин и оборудования второй руки. Данная ситуация приводит к возрастанию социально-

экономических и научно-технических различий между странами, входящими в различные региональные интеграционные объединения.

Отсюда возникает вопрос о необходимости пересмотра всей системы международного экономического порядка, чтобы региональная экономическая интеграция превратилась в разумный и реальный в плане улучшения жизненных условий населения, процесс. Кроме того, взаимоотношения между экономическими блоками должны восстановить историческую справедливость.

Колониальные страны в свое время разрушили экономику стран Азии и Африки. Еще тогда, в течении XVI – XIX вв., последние были обречены на нищету и отсталость. Поэтому, сегодня развитые страны, т.е. бывшие метрополии призваны устранить все барьеры на путях восстановления исторической социальной справедливости. Это требует изменения сложившихся отношений между экономическими региональными объединениями и союзами коренным образом. Первым шагом в этом направлении явился бы решительный отказ от всякого рода модификации колониальных теорий, типа неолиберальной и перехода к практике управляемого рынка, носящего сильную социальную нагрузку.

Сама сложившаяся практика региональной экономической интеграции устарела и не соответствует не только нынешним потребностям человечества. Порою она противоречит здравому смыслу. Таджикистан, например, находится рядом с Афганистаном, а Белоруссия географически отделена от него тысячами километров. Таджикистана и Афганистана объединяют общие водно-энергетические ресурсы, схожие биоклиматические условия, общее историческое прошлое, общий язык, религия и т.д. Представляется весьма глупым, когда Таджикистан в рамках предстоящего членства в Таможенный Союз может дать предпочтения Белоруссии, а не Афганистану.

Афганистан и Таджикистан с ослаблением политической напряженности в соседней стране смогли бы приступить к совместному использованию водно-энергетических, минерально-сырьевых, биоклиматических и рекреационных ресурсов Пянджского речного бассейна. В этом плане между обеими странами начато интенсивное сотрудничество. В течении короткого промежутка времени были построены 6 автомобильных мостов на реке Пяндж, которые связывают обе страны. Из Таджикистана вглубь территории Афганистана протянута ЛЭП, которая обеспечивает ряд северных провинций этой страны электроэнергией (вплоть до города Кабула).

Предпринимательство Афганистана и Таджикистана в последние годы объединяет свои усилия для расширения масштабов торговли между двумя странами. Происходит определенная специализация на базе имеющихся ресурсов. Предприниматели из северных провинций Афганистана ныне располагают текущими данными о конъюнктуре рынка в Таджикистане, а таджикские предприниматели – о динамике текущих цен в рынках городов северного Афганистана. В последнее время растет ввоз из Таджикистана в Афганистан водоемкой сельскохозяйственной продукции – дынь, арбузов, тыкв, томатов, а из Афганистана в Таджикистан – цитрусовых. Нет никакого сомнения в том, что с установлением мира и согласия в Афганистане будет происходить интеграция двух экономик или на основе двухсторонних отношений о свободной торговли, либо в рамках новых региональных интеграционных объединений.

Вполне возможно, что недостаточная эффективность существующих региональных союзов и объединений приведет не только к их видоизменению, но и к определенным перегруппировкам соседних стран на базе компактных территорий. Например, вполне возможным представляется создание нового экономического союза в составе персоязычных стран – Таджикистан, Афганистан, Иран, и некоторых соседних стран Азии – Индия, Пакистан , Турция и Азербайджан. Эти страны в географическом плане имеют более благоприятные условия для экономического сотрудничества. Они имеют долгую историю сотрудничества, общие этнические корни, включая традиции, обычаи и исторический опыт взаимного общения. Если бы не было политических проблем, унаследованного от прошлого, то названные страны имели бы ныне совершенно другую структуру экономических взаимоотношений. Но главное заключается в том, что через эти страны проходят международные транспортные коридоры, соответствующие современным мировым стандартам.

Будущее экономических блоков зависит от той оценки, которую они получают в условиях современного финансово-экономического кризиса. Региональные интеграционные объединения оказались не в состоянии ослабить давление этого кризиса на экономику. К тому же, внутри каждого из них разразились свои «блоковые» кризисы, наиболее ярким примером которого является кризис Евросоюза.

Страны Центральной Азии больше всех испытали на себя пагубные результаты либерализации экономики и свободной торговли. Под воздействием последних в регионе идут дезинтеграционные процессы. Политика «открытого регионализма» привела к разрушению обрабатывающей промышленности и экспортоориентированных отраслей. Западные и китайские инвестиции направляются на развитие сырьевых отраслей. Самая широкая внешнеторговая и инвестиционная экспансия ощущается со стороны КНР, обладающим 3 трлн. валютно- золотым запасом. Такая экспансия несет в себе очень большие экономические и политические опасности.

Достаточно сказать , что за период 1991-2010 гг. товарооборот между Россией и Таджикистаном вырос в 18 раз, между Китаем и Таджикистаном в 1370,6 раза. Такие же тенденции присущи и торговле других центрально-азиатских стран с Китаем. В структуре внешнеторгового оборота Таджикистана торговля с Россией составляет 24,9%, с Китаем 17,8% (в 1991 год – было 0,1%), с Турцией – 11,3%. В центрально-азиатских странах многие исследователи разделяют мнение, что фактически Китай находится на первом месте среди внешнеторговых партнеров стран этого региона.

Китай, следуя принципу свободной торговли, нанес огромный ущерб экономике центрально-азиатских стран, особенно их обрабатывающей промышленности. Нормализация экономической ситуации в Центральной Азии возможна лишь на путях последовательного осуществления импортозамещающей политики и использование механизмов умеренного протекционизма с целью вытеснения из регионального рынка тех китайских товаров, которые могут производиться эффективно в странах региона. Россия и Индия в этом плане могут сыграть весьма позитивную роль. Их экономические и торговые связи с центрально-азиатскими странами должны быть построены с учетом реальностей с которыми сталкиваются последние.

В этой связи можно смело утверждать, что для названных стран нет никакой необходимости о постановке и реализации вопроса о достижении уровня китайско-центрально-азиатских торговых отношений. К тому же, вступление в конкуренцию с Китаем на торговлю с названным регионом может иметь для них очень высокую цену. Россия и Индия могут оказать этому региону действенную помощь в жизненно важной сфере – в трансформации деиндустриализации в реиндустриализацию путем активного участия в реализации политики импортозамещения в странах Центральной Азии.

Для этого нужно наладить активные контакты между соответствующими государственными структурами стран Центральной Азии и названных стран с целью мобилизации частного сектора на быстрое развитие производственной кооперации между ними. Особенно важным в этом отношении представляются меры по восстановлению предприятий, которые прекратили свою производственную деятельность из-за неравной конкуренции их продукции с товарами, поступающими из Китая. Другими словами, приоритетным направлением в экономических связях между Россией , Индией и центрально-азиатскими странами должна стать производственная кооперация. Если для Китая в связях с Центральной Азией на первом месте находится торговля потребительскими товарами, то для России и Индии – на первом месте должны стоять вопросы содействия политике этих стран относительно импортозамещению.

Необходимо иметь ввиду, что в последние годы в центрально-азиатских странах имидж КНР расшатывается. Причинами данного явления, на наш взгляд, являются: а) территориальные претензии этой страны к соседним государствам и пограничные конфликты; б) использование торговли в качестве фактора разрушения экономики развивающихся и переходных обществ; в) ориентация на сырьевые ресурсы региона, пассивное отношение к вопросу о восстановлении прекративших работу из-за неравной конкуренции предприятий.

Россия и Индия в своих намерениях развивать торгово-экономическое сотрудничество с центрально-азиатскими странами должны извлечь определенные уроки из опыта отношений КНР со странами этого региона, как в положительном, так и в отрицательном ракурсах. В южном направлении единственной конкурентоспособной дорогой для развития торговых отношений с Центральной Азией является так называемый пакистанский коридор. Однако, по известным политическим соображениям этот транспортный коридор не может обслуживать индийско-центрально-азиатскую торговлю. Другие маршруты, включая маршрут через иранский порт Чабар и Западный Афганистан для перевозки массовых грузов представляются недостаточно эффективными.

Наиболее эффективной нишей для российского и индийско-центрально-азиатского сотрудничества является крупномасштабное участие этих стран в осуществлении импортозамещающих программ республик Центральной Азии. Речь идет о восстановлении тех предприятий, которые в разное время закрывались из-за невозможности конкуренции с дешевыми китайскими товарами, которые к тому же отличались низким качеством.

Содействие импортозамещающему сектору означает реализация политики приоритетного развития производственного сектора и повышение занятости в этом секторе. Особенно важно, чтобы такое содействие способствовало развитию тех производств, чья одноименная продукция завозится из Китая. Россия и Индия могли бы оказать помощь центрально-азиатским странам в развитии научно-производственной инфраструктуры сельского хозяйства. Здесь имеются ввиду селекционные и семеноводческие станции, опорные пункты, племенные хозяйства, машинно-тракторные станции, службы по химической и биологической защите растений, предотвращение инфекции животных и т.д. Нетрудно отсюда прийти к выводу, в особенности, о передачи опыта и достижения Индии, накопленные в ходе «зеленой» и «белой» революции центрально-азиатским странам.

Ресурсы производственной кооперации между центрально-азиатским регионом, Россией и Индией очень велики. В этой связи нужно отметить, что и в социальном, и в технологическом отношениях производственное оборудование, изготовленное в России и Индии представляется более адаптированным, чем оборудование, ввезенное из других стран. Нужно, чтобы правительство центрально-азиатских стран более внимательно относились к российским и индийским предпринимателям, оперативно пресекая всякие проявления коррупции по отношению к ним.

В своих экономических отношениях со странами Центральной Азии было бы целесообразно, если Россия и Индия наращивают содействие им и в других направлениях. Очень важным для них представляется сотрудничество с этими странами в области образования и здравоохранения. Эти страны нуждаются в подготовке инженерно-технических работников, поскольку инженерные вузы после распада СССР ослабли значительным образом.

Например, в странах Центральной Азии уже в течении более 20 лет успешно действуют турецкие лицеи. Россия и Индия могли бы следовать этому примеру. Тем более, что в странах региона русский язык, наряду с английским пользуются большой привлекательностью. Можно было бы организовать сеть платных российских и англо-индийских лицеев и колледжей в центрально-азиатских странах. Есть уверенность в их успешной работе. Одновременно нужно направить большое количество студентов из этих стран в университеты России и Индии, особенно по тем специальностям по которым для будущего этих стран имеют значения.

Такие изменения повышают актуальность развития интеграционных процессов между странами Северной, Центральной и Южной Азии.

В настоящее время для стран Центральной Азии межрегиональная интеграция со странами Южной Азии представляется более реальным, чем сама региональная интеграция. Самое главное, для стран Центральной Азии заключается в величине этого рынка, которая отличается высокими темпами роста. В странах Южной Азии проживает 1,5 млрд. населения, представляющее собой огромную производительную и потребительскую силу.

В этой связи нужно оговориться, что российские и индийско-центрально-азиатские торгово-экономические отношения должны быть полностью свободны от любого проявления теории и концепции неолиберализма. Свободная торговля, если как принцип будет использована, то это необходимо сделать для более эффективного использования тех принципов сотрудничества, которые выступают в качестве факторов развития производственного сектора.

# Усиление интеграционного процесса в Евразийском экономическом союзе

# Strengthening the Integration Process in Eurasian Economic Union

Prof. Dr. Jusup Pirimbaev (Kyrgyzstan-Turkey Manas University, Kyrgyzstan)

## Abstract

The occurrence of Kyrgyzstan in the Eurasian Economic Union acquires real features as Roadmap for joining the Customs Union is almost aligned with the member-states. In order to harmonize the process of entering the EEU should start to develop areas of cooperation and emergence as a full partner. Reasonably thoughtful integration mechanisms can give a powerful impetus to economic dynamics of the Union and its member-countries and create a favorable atmosphere for human relationships on a huge territory representing as single space. It is hoped that cooperation in EEU objectively lead to the unification of the economic interests of the Central Asian countries through the integration of the economies in the region.

Вхождение Кыргызстана в Евразийский экономический союз обретает реальные черты, поскольку Дорожная карта вступления в Таможенный союз практически согласована со странами-учредителями. Для того чтобы процесс согласования по вхождению в ЕЭС не растянулся на неопределенный период, следует уже сейчас начинать подготовку для обогащения идеями, разработки направлений сотрудничества и становления в качестве полноценного партнера. Если посмотреть на цифры, то нынешние страны-члены ЕЭС по численности населения в 172,6 млн. человек находятся на 8-м месте в мире, по территории в 20229248 км2 - на 1-м, по ВВП (ППС) в 2,895 трлн. долл. США - на 6-м. Как видно из приведенных данных, рынок является достаточно емким. Безусловно, такие масштабные показатели в экономическом плане требуют согласованных действий для обеспечения сбалансированного развития экономики на всей территории ЕЭС. Поэтому огромная ответственность ложится на руководителей стран-участниц Союза, требуя проявления политической воли в обеспечении установленных экономических взаимоотношений. При этом придется отказаться от проявления политических амбиций, вызванных эйфорией независимости.

Сейчас продолжаются активные дискуссии по поводу формирования системы управления и ее структуры. Лидеры стран-членов Союза пока придерживаются единого мнения о недопущении политической составляющей в управлении Союзом, акцентируя внимание только на вопросах экономической интеграции. В этом контексте созданная Евразийская экономическая комиссия работает на опережение по проведению экономического мониторинга стран-членов, а также стран, пожелавших войти в состав Союза, - это Кыргызстан, Армения и Таджикистан.

В целях формирования единого экономического пространства в рамках ЕАЭС предлагается создание наднациональных структур:

- Комиссия по экономике;
- Комиссия по сырьевым ресурсам (устанавливает цены и квоты на сырьевые товары и энергоносители, координирует политику в области добычи, продажи золота и других драгоценных металлов и др.);
- Фонд по делам экономического и научно-технического сотрудничества, формирующийся за счет вкладов стран ЕАЭС (финансирует перспективные наукоемкие экономические и научно-технические программы, оказывает помощь в решении круга задач, в том числе правовых, налоговых, финансовых, экологических и т. д.);
- Комиссия по межгосударственным финансово-промышленным группам и совместным предприятиям;
- Международный инвестиционный банк ЕАЭС;
- Международный арбитраж ЕАЭС;
- Комиссия по вводу расчетной денежной единицы;
- Комиссия по экологии.

Несмотря на создание наднациональных структур, на первый план выдвигаются гарантии равноправных условий работы при создании ЕАЭС. Одним из важнейших условий является обеспечение унифицированного подхода к налогообложению налоговых резидентов граждан с тем, чтобы в случае заключения долгосрочных трудовых договоров гражданами стран ЕАЭС налогообложение их доходов от работы по найму в Российской Федерации осуществлялось на условиях, не менее благоприятных, чем налогообложение налоговых резидентов РФ. Если анализировать весь ход договорных процессов ЕАЭС

между его членами, то можно увидеть твердую позицию защиты собственных экономических интересов каждой страны. Причем не наблюдается навязывания мнений в принятии решений о создании действенной структуры ЕАЭС и обеспечении ее эффективности. Хотя аргументируются направления экономического сотрудничества, но еще не определено, по каким направлениям будет осуществляться интеграция экономик. Это дело времени, в ходе сотрудничества эти вопросы объективно будут требовать внимания.

В этой связи надеемся, что новые члены ЕАЭС обязательно внесут свою лепту в совершенствование механизма сотрудничества. Поэтому Кыргызстан, прежде чем стать полноценным членом ЕАЭС, должен готовиться и решать внутренние проблемы, связанные с реализацией реальных механизмов взаимодействия. На наш взгляд, на повестке дня стоят следующие проблемы.

Во-первых, следует скоординировать действующую учетную систему со странами сотрудничества в рамках экономического союза как информационную базу для аналитической деятельности и выработки управленческих решений, а также своевременного проведения корректирующих работ. В этом аспекте особую значимость приобретает формирование систематизированного производственного учета, отвечающего современным требованиям управления. Пока же состояние производственного учета в Кыргызстане не обеспечивает информацией аналитический процесс. Многие конфликтные ситуации на крупных производствах с участием иностранных инвестиций происходят именно вследствие закрытости данных производственного учета, представляющих коммерческую тайну по кыргызскому законодательству.

Однако следует подчеркнуть, что данные производственного учета не имеют никакого отношения к коммерческой тайне, наоборот, они способствуют объективному представлению о производственном процессе, осуществлению полноценной деятельности в области ценообразования и строгому соблюдению и контролю необлагаемых статей затрат. Решение этой проблемы внутри страны позволит постепенно повысить производственную культуру и улучшить взаимоотношения между партнерами.

Кроме того, скоординированная система производственного учета является базой реальной оценки имущества, что служит очень важным фактором доверия между странами экономического сотрудничества. Последствия несоблюдения такого подхода мы пережили в процессе приватизации, когда реальная стоимость объектов и имущества была многократно искусственно занижена, тем самым создавались условия для разделения между малочисленной частью населения материального состояния всей страны. Методика оценки ущербов, выгод и имущества в Российской Федерации отличается от подобной методики в Кыргызстане, основанной на рекомендациях международных организаций, что создает реальную проблему взаимопонимания. Поскольку производственная логика требует знания границ возмещения затрат за счет цен, прибыли и капитальных вложений.

Во-вторых, следует упорядочить амортизационную политику как источник внутренних инвестиций производственных единиц и сельхозпроизводителей. На сегодняшний день амортизационные отчисления, включенные в цену продукции и освобожденные от налогообложения, носят абстрактный характер и размыто их экономическое содержание. Ибо на практике не видно реального функционирования системы использования средств от амортизации. Это отчетливо видно из практики энергетической системы Кыргызстана, где оснащенность основных средств по данным энергетиков составляет более 80%, а средств для хотя бы их частичного обновления не могут найти. Единственный выход, который видят как энергетики, так и правительство страны, - это повышение тарифов. Причем в качестве главного довода всегда приводится высокий уровень тарифов в развитых зарубежных странах и низкий их уровень в Кыргызстане. С такой логикой трудно будет в дальнейшем управлять данным сектором, поскольку такой подход всегда создает условия для социальных конфликтов. В Кыргызстане тарифы низкие, потому что энергия дешевая. Поэтому в основу тарифной политики должна быть положена низкая себестоимость производимой энергии и умелое использование средств от амортизации. При этом четко надо различать внутреннюю тарифную политику и внешнюю - для продажи электроэнергии за рубеж. Вхождение Кыргызстана в ЕАЭС будет сталкивать нас с этой проблемой, учитывая строительство Верхненарынского каскада ГЭС с участием российских партнеров и перспективу экспорта электроэнергии в Китай и Пакистан.

В-третьих, требуют решения организационные вопросы реализации сельскохозяйственной продукции без переработки. Учитывая, что она является быстропортящейся продукцией, то в условиях наличия мелких сельскохозяйственных производителей обеспечение ее сохранности и качественной транспортировки на дальние расстояния будущим партнерам невозможно. Удлинение сроков от сбора урожая до доставки потребителям чревато большими убытками. В этой связи есть необходимость аккумулировать внимание государства на создание в регионах заготовительно-закупочных центров, позволяющих ускорить процесс организованной погрузки и доставки грузов. Организованная доставка грузов обеспечивает их безопасность. Такие центры можно организовать за короткий период за счет ГЧП. В начальный период вхождения в Союз главными отраслями являются именно сельское хозяйство и легкая промышленность. В перспективе доля экспорта сельскохозяйственной продукции в виде сырья

должна иметь тенденцию к снижению, а приоритетными являются их переработка на местах и реализация в виде готовой продукции с включением добавленной стоимости.

В-четвертых, сейчас мы должны приступить к подготовке профессиональных кадров для привлечения их на работу в управленческих структурах ЕАЭС. От них будут зависеть уровень и эффективность экономического сотрудничества нашей страны в рамках данного объединения. А иначе будем обвинять партнеров в собственных упущениях, искать причины в формальностях в деятельности союза.

Союз требует от всех сторон профессионального подхода к делу, интеллектуальной конкуренции, жесткого соперничества, в положительном смысле этого слова, и строгого соблюдения правил экономической игры, обеспечивающих сбалансированное экономическое развитие всех стран-членов ЕАЭС.

Перечисленные меры, безусловно, будут способствовать упрощению интеграции производственных единиц нашей страны после вхождения в экономический союз.

Вместе с тем нынешние наднациональные структуры управления, которые перечислены выше, требуют определенного переосмысления. Дело в том, что за исключением комиссии финансового сектора деятельность остальных комиссий связана в основном с такими функциями, как координация, мониторинг, консультации и оказание помощи. Однако главной целью создания экономического союза является обеспечение мощной материальной базы экономического развития единого пространства. А это в свою очередь требует разработки механизма интеграции реальных секторов экономик стран-членов ЕАЭС. Исходя из этого целесообразно создание интеграционной комиссии в составе единой экономической комиссии. Она бы способствовала ускорению удовлетворения потребностей в общесоюзном масштабе за счет использования дополнительных производительных сил стран ЕАЭС. Данная комиссия стала бы мощным подспорьем для экономической комиссии в разработке различных программ стратегического развития союза, плановых созидающих мер использования производственного потенциала союзного масштаба. Они должны быть тесно связаны с обеспечением материальных потребностей в осуществлении деятельности ОДКБ, связанной как с военной составляющей, так и обеспечением обмундированием, питанием, транспортировкой и т.д.

Без интеграции проиводственного сектора экономики навряд ли будет достигнуто эффективное сотрудничество внутри союза, который будет ограничиваться в пределах существующей ныне практики торговых отношений между странами на базе существующего экономического потенциала стран-членов союза, особенно слаборазвитых. Подход к интеграции предполагает создание различных форм сотрудничества, начиная от совместных предприятий, заканчивая акционерными обществами различных видов в сочетании с их кооперацией, специализацией и т.д. Решение проблем наукоемких, энергоемких и трудоемких призводств не только требует интеграции, но и позволяет аккумулировать потенциал высококвалифицированных кадров единого экономического пространства.

Имеет перспективу обдуманная экономическая интеграция различных регионов стран-членов ЕАЭС, имеется в виду заключение различных соглашений на региональном уровне. В настоящее время Чуйская, Ошская и Джалал-Абадская области Кыргызстана сотрудничают с несколькими субъектами Российской Федерации, хотя пока желаемых результатов не достигнуто. А их эпизодический характер необходимо превратить в систематически действующий механизм.

Уместно напомнить, что страны Центральной Азии, к большому сожалению, не смогли прийти к общей позиции по поводу объединительных процессов, несмотря на общность религии, культуры, а также самодостаточные ресурсы. Причины известны - это политические амбиции, чрезмерная самоидентификация, неполное осознание значения суверенитета и независимости, нездоровое соперничество в лидерстве в Центральноазиатском регионе, а также недостаточный опыт международных отношений. Пора, наконец, понять, что уровень безопасности прямо пропорционален уровню экономического сотрудничества. Это подтверждает история развития человеческой цивилизации. Замкнутость всегда была источником внутренних противоречий и порождения нестабильности. Имеется надежда, что сотрудничество в рамках ЕАЭС объективно приведет к объединению экономических интересов центральноазиатских стран через интеграцию экономик внутри этого региона.

В рамках деятельности комиссии по интеграции открывается широкая возможность разработки интеграционных механизмов в социальном секторе экономики, что не нашло своего отражения в функциональной деятельности других комиссий ЕЭК. Без включения этого сектора экономики сложно будет достичь эффективной формы интеграции. Мы не разделяем точки зрения разработчиков программ ЕАЭС о том, что «... здравоохранение, образование, культура ... не относятся к экономической интеграции и не могут быть перенесены в формат экономического союза». А разве они не являются секторами экономики, только нематериальной ее составляющей. Без их присутствия экономика окажется без мощной поддержки духовного динамизма и энтузиазма. По мнению разработчиков без взаимообогащения культурами стран-участниц союза сомнительна возможность формирования культуры экономических взаимоотношений

Таким образом, можно сделать следующие выводы: во-первых, необходимо категорически отметать сравнение ЕАЭС с возрождением СССР или созданием новой империи или сверхдержавы. Ведь никто не называет ЕС, БРИКС или АСЕАК империей или сверхдержавой. Все эти понятия политически устарели и не имеют значения. Вхождение или не вхождение в подобные союзы - это суверенное право каждой страны, и вмешательство со своими советами и консультациями по этим вопросам является неэтичным и даже аморальным. Во-вторых, обоснованно продуманные интеграционные механизмы могут придать мощный импульс динамике экономического развития Союза и его отдельных стран-участниц, создавая благоприятную атмосферу для человеческих взаимоотношений на огромной териоррии, представляющей единое пространство. В-третьих, кыргызстанцы не должны забывать завета Ч. Айтматова о планетарном мышлении, о том, что мы все являемся землянами, и интересы должны аккумулироваться вокруг нас и для нашего блага.

# How Do Institutions Determine Economic Growth? Evidence from Central and Eastern Europe before and during Global Economic Crisis

Prof. Dr. Trajko Slaveski (Ss. Cyril and Methodius University, Macedonia)

Ph.D. Candidate Darko Lazarov (Goce Delchev University, Macedonia)

## Abstract

We investigate the influence of institutions on economic growth and the level of income per capita in CEE region, before and during the global economic crisis. We use principal factor component analysis in order to create a more reliable and representative variable that will measure the institutional quality in our regression models, and avoid the multi colinearity, a common statistical weakness for this type of regression models. The results from panel (random and fixed effects) regressions and GMM dynamic panel regression lead to two contrasting insights. The first regression model shows positive and statistically significant correlation between institutions and economic growth, which would imply that the CEE countries that have created a strong institutional capacity during transition and post-transition period have experienced higher economic growth. The second regression model, which refers to the global economic crisis period, shows a negative influence of institutions on economic growth for the same sample of countries. One explanation for this result might be the fact that countries with a higher degree of integration into the EU were also more vulnerable to the global economic crisis.

## 1 Introduction

The panel econometric techniques have been applied on cross-country data for representative CEE countries, just to investigate the impact of institutions on economic growth and the level of income per capita before and during the global economic crisis. However, testing the correlation and causality between institutions and growth involves the difficult issue how to measure the quality of institutions.

Many international agencies and researchers have developed empirical indicators that claim to measure different aspects of institutional quality such as financial stability, quality of government regulations, democracy, quality of laws and courts, corruption, and many others. One of the key challenges confronting us in this empirical study, having in mind the large number of government and institutional indicators, is how to combine this set of indicators into one dimension with a clear-cut interpretation of quality of institutions and then analyze its impact upon income per capita and economic growth. The most widely used approach to construct composite variables is to select relevant indicators and weigh them together using predetermined weights. (This is what the WB and others providing these ratings do).

The empirical results estimated in this research lead to two contrasting insights. The first regression estimation by using fixed, random and GMM models for the transition and post-transition period shows positive and statistically significant correlation between the quality of institutions (composed by index of corruption, political rights and civil liberties) and economic growth derivate as logarithm of real GDP per capita, which would imply that the CEE countries that have created a strong institutional capacity during transition and post-transition period have experienced higher economic growth. The second regression model, which refers to the global economic crisis period, shows a negative influence of institutions on economic growth for the same sample of countries. One explanation for this result might be the fact that countries with a higher degree of integration into the EU were also more vulnerable to the global economic crisis.

## 2 Literature Review

Quite a few studies analyze the role of institutions in the process of economic growth. There are papers in the academic literature that investigate the influence of institutional quality on economic growth in the CEE region. Many of these studies are inspired by Hall and Jones (1999) who found a relation between institutional quality and economic growth for a large sample of countries. Beck and Laeven (2005) offer a political economy explanation of why institution building has varied so much across transition economies, using two major explanatory factors: reliance on natural resources and years under socialist government. This research is based on North's hypothesis that "institutions are not usually created to be socially efficient, but are created to serve the interests of those with bargaining power to create new rules" (North 1990). They conclude that countries with less open political systems in the transitional process and countries that have substantial natural resources have failed in development of the market-compatible institutions and consequently had slower economic growth in the transitional period.

The research in this paper is directly linked to the literature on the relationship between institutions and economic growth and development. North (1981) emphasized the role of institutions for economic development. Acemoglu, Johnson and Robinson (2001) estimate large effects of institutions on income per capita by using differences in mortality rates of European settlers as an instrument for current institutions. Easterly and Levine (2003) show that institutions, not policies, explain the cross-country differences in GDP per capita once controlled for the impact of endowments on institutions and on economic development. Rodrik (2004) sheds some more light on the new institutional focus and the so called "second generation reforms". The agenda of new "government" reforms aimed at reducing corruption, improving the regulatory apparatus, rendering fiscal and monetary institutions independent, strengthening corporate governance, enhancing the function of the judiciary is meant to overcome the apparent inefficiency of the earlier wave of reforms relying heavily on liberalization, stabilization and privatization.

On the other hand, Bartlett and Prica (2012), investigating the transmission channels and mechanisms from the global crisis to SEE countries, find a negative correlation between institutions and economic growth during the economic crisis period, first because countries that have made the most progress in integrating with the EU and in adopting EU-compatible institutions were more vulnerable to the crisis. But, at the same time, these countries were better positioned to benefit from the recovery, since businesses in those countries operate within a more supportive institutional environment.

Over the past two decades the role and relationship between institutions and economic growth in transition countries have been of interest among many economists. In the table below we present the selected studies and their main findings.

| Study | Measures | Techniques | Main findings |
|---|---|---|---|
| Paulo Mauro (1995) | Bureaucratic efficiency index, Political stability index and Corruption index | OLS and 2SLS regression | Find positive correlation between high bureaucratic efficiency and economic growth, vice-versa. Positive relationship between political stability and growth, and negative relationship between index of corruption and growth. |
| De Melo Martha, Cevdet Denizer, and Alan Gelb (1996) | Index of liberalization for the transition countries | Panel regression | Find a positive relationship between progress of liberalization and output growth |
| Aslund Anders, Peter Boone, and Simon Johnson, (1996) | Structural and institutional reforms for the CEE countries | OLS and IV regression | Find no robust effect of measures of reform and macroeconomic policies on output change |
| Beck and Leaven (2005) | Natural resources and the historical experience of Transition countries as Instrumental variables | Instrumental variables – IV regression | Find positive relationship between institutional development and economic growth |
| Will Bartlet and Ivana Prica (2012) | Institutional quality WGI and Progress in transition – EBRD transition index | OLS regression | Negative correlation between quality of institutions and growth rate |

*Table.1 Literature review of institutions and economic growth*

## 3   Panel Regression Analysis of Institutions and Economic Growth in CEE Region

### 3.1  Data, Sources, Descriptive Statistics and Variables Description

In our sample we use data for 13 countries from CEE region collected from many different sources. From Table.2 we can see the arithmetic mean of the variables, standard deviation, minimum and maximum of the variables, and how many observations, panel and average time periods. The variables are: the level of GDP per capita; the rate of economic growth; the quality of institutions measured by the index of corruption, political rights and civil liberties, innovation capacity measured by royalty payments, general expenditure on research and development, and journal articles; human capital measured by gross enrolment in primary, secondary and tertiary education and education spending; export demand; bank credit to the private sector; openness as a share of total trade in GDP; investment rate; FDI; inflation rate; World Governance Indicators; and EBRD Transition Indicators.

| | Variable | Mean | Stand. dev. | Min. | Max. | Obs. | |
|---|---|---|---|---|---|---|---|
| LGDP | Log GDP per capita, US$ | 8.08 | 0.74 | 6.09 | 9.51 | N = | 124 |
| Economic growth | The rate of economic growth per capita | 2.21 | 5.88 | -17.55 | 14.84 | N = | 55 |
| Institution | Log of Institution quality (Index of corruption, political rights and civil liberties) | 0.53 | 0.71 | -2.38 | 1.20 | N = | 122 |
| Innovation | Log of Innovation capacity (Royal payments, GERD and Journal articles) | -1.89 | 0.34 | -2.69 | -1.17 | N = | 120 |
| Human capital | Log of Human capital (Gross enrolment in primary, secondary and tertiary education and education spending) | 3.86 | 0.11 | 3.57 | 4.08 | N = | 135 |
| Export | Log of Export demand for goods and services, US$ | 18.14 | 1.59 | 13.92 | 21.09 | N = | 135 |
| Bank credit | Log of Bank credit to private sector, as % of GDP | 3.05 | 0.71 | 1.25 | 4.48 | N = | 131 |
| Openness | Openness (Export minus Import), as a % of GDP | 4.53 | 0.32 | 3.86 | 5.11 | N = | 53 |
| Investment Rate | Investment rate, as a % of GDP | 3.17 | 0.25 | 2.34 | 3.68 | N = | 50 |
| FDI | Foreign direct investment | *17.25* | *1.44* | *13.69* | *20.46* | N = | 51 |
| Inflation Rate | Inflation rate, % | *1.54* | *0.60* | *0.04* | *2.72* | N = | 53 |
| WGI | World Governance Indicators | 0.29 | 0.40 | -0.27 | 0.986 | N = | 50 |
| EBRD Index | EBRD transition Index | 3.64 | 0.25 | 3 | 4.05 | N = | 55 |

*Table.2 Descriptive statistics and variables description*

### 3.2 Methodology of Research

In this paper we use panel data related to the countries in the sample. Because they are bound to heterogeneity in data for different countries, panel data estimation seems appropriate since it takes into account individual heterogeneity. Panel data are also more informative data; they include more variability, less colinearity and more efficiency. The question which researcher poses is which estimator to use: Random Effects Model, or Fixed Effects Model. Random Effects Model seems appropriate when we think that unobserved effect is uncorrelated with all of the explanatory variables. Estimation of Random Effects Model by Generalized Least Squares (OLS) is easy and routinely done by many econometric software packages. The basic model is as follows:

$$y_{it} = \beta_0 + \beta_1 x_{it1} + \beta_2 x_{it2} + \beta_k x_{itk} + a_i + u_{it} \tag{1}$$

The previous equation becomes RE model when unobserved effect $a_i$ is uncorrelated with all of the explanatory variables i.e. covariance is zero:

$$Cov(x_{itn}, a_i) = 0 \qquad t = 1,2,....T, n = 1,2...k \tag{2}$$

Now for the fixed effect if we have the following expression: $y_{it} = a_i + \beta_1 X_{it} + u_{it}, t = 1,2...T$, for each cross-sectional unit average, this equation becomes, $\bar{y}_{it} = a_i + \beta_1 \bar{X}_{it} + \bar{u}_{it}$, here $\bar{y}_{it} = \frac{\sum_{t=1}^{T} y_{it}}{T}$, if we subtract two previous equations (in order to eliminate the unobserved time constant) we get:

$$y_{it} - \bar{y}_{it} = \beta_1(x_{it} - \bar{x}_i) + u_{it} - \bar{u}_i = \Delta y_{it} = \beta_1 \Delta x_{it} + \Delta u_{it} \tag{3}$$

So the fixed effects estimator is efficient when idiosyncratic errors are serially uncorrelated, and there is no assumption about the correlation between the unobserved effect and the explanatory variables. Next, to test for the robustness of the results and to solve the endogenity problem, Dynamic panel data estimator namely Arelano/Bond GMM estimator is the most appropriate model, the basic model with lagged dependent variables is:

$$y_{it} = a_i + \gamma y_{it-1} + u_{it}, t = 1,2...T \tag{4}$$

In the previous equation residuals are assumed to follow normal distribution, i.e. $u_{it}, \sim (0, \sigma_u^2)$. Here $y_{it-1}$ depends positively on $a_i$, this is easy to see when we are inspecting the model for t-1 period:

$$yy_{it-1} = a_i + yy_{it-2} + u_{it-1}, t = 1,2...T \tag{5}$$

So there exist endogenity problem and OLS and GLS, i.e. FE and RE are not consistent. But the Arelano/Bond GMM estimator is consistent. The moment conditions use the properties of the instruments, and the instruments in the GMM Arelano /Bond model are the differenced explanatory variables:

$$y_{it-m}; m \geq 2 \tag{6}$$

Now the instruments are uncorrelated with the future errors $u_{it}$ and $u_{it-1}$. The increasing number of moment of conditions is $t = 3,4...T$. GMM estimation is combined with RE and FE estimator because as $T \to \infty$, estimates of the RE and FE model begin to converge.

### 3.3 Econometric Model, Results and Explanations

Since data cover 13 countries, and the period from 1993 to 2007, we apply panel estimation techniques. Panel data actually are cross-sectional data observed over time. The first econometric model that we estimate has the following structure:

$$\ln gdppercapita = \gamma_0 + \gamma_1 \ln Ins + \gamma_2 \log Innov + \gamma_3 Hum + \gamma_4 \log Ex + \gamma_5 Invest + \varepsilon_i \tag{7}$$

The left side of the equation articulates the *economic growth derivate as logarithm of real GDP per capita* as independent variable, expressed in terms of natural logarithm of GDP per capita in different time periods. On the right side are independent variables as determinants of economic growth for analysed group of CEE countries (institution quality measured by index of corruption, index of democracy, economic and civil liberties and political rights; innovation capacity measured by royalty payments, number of patents and journal articles and GERD; human capital measured by gross enrolment in primary, secondary and tertiary education, education spending and number of teachers per student); investment rate - private and public capital investment as a share of GDP; export as a percentage of real GDP; and bank credits to the domestic private sector as a percentage of GDP.

The results from the empirical study that we have partly done by using data for group of CEE countries in modified Panel econometric methods and OLS regression analysis show two controversial results. First, regression analysis which we use to estimate the first econometric model shows strong positive and statistical significant correlation between quality of institutions and economic growth in time series of 1993-2007 for the sample of CEE countries. But the second regression model which refers to the global economic crisis period shows negative correlation between institutional quality measured by WGI and EBRD Transition Indicators Index for the same sample of countries.

The first important question here is choosing an appropriate model for the estimation. The Breusch-Pagan LM test proved that there is significant difference of variance across countries i.e. we cannot use simple OLS, but rather Random effects model. But, the results from Hausman test is in favor of fixed effects model. Ambiguity of these two tests made us use the RE and FE models. Fixed effects model assumes that individual heterogeneity is captured by the intercept term, while Random effects model assumes that individual heterogeneity is captured by the intercept term and some random component. But, the coefficients of the variables in the two models are similar in size and they are of the same sign. The quality of institutions shows positive effect on economic performance during transition and post-transition period for all representative countries in our model, i.e. those countries which have implemented growth-promoting institutions (high level of transition progress to market economy, successful results in integration process to EU and adaptation to EU-compatible institutions, high quality of government policy making) have experienced a superior economic performance in the analyzed period.

Correlation between institutional quality and economic growth is relatively significant – an increase of institutional quality by 1 percent will contribute by 0.131 and 0.200 percent to the increase in the rate of economic growth, respectively in FE and GLS models.

The innovation capacity and human capital as fundamental factors of economic growth based on endogenous growth models have important role for economic growth, taking into consideration that the factor productivity and human capital were binding constraints, and the process of creation the National Innovation and Education System had positive implication in this group of countries. The regression results show that an increase of innovation capacity and human capital for 1% will increase the rate of economic growth for 0.124 and 1.149,

respectively with FE. The results are similar using the GLS model. These correlations are statistically significant at 95% and 99% trust's interval.

| Observations | 101 | 101 | 87 |
| R-squared | 0.474 | 0.753 | |

Standard errors in parentheses
*** p<0.01, ** p<0.05, * p<0.1

***Table.3*** *Results for the Fixed and Random effects model, and Arrelano-Bond (GMM) regression*

Most of the countries in our sample are small open economies and it is likely that there is positive and statistically significant link between export as a percent of real GDP and economic growth as a logarithm of real GDP per capita. Growth in openness measured by export share in GDP would make the economic growth more dynamic for 0.534% with a level statistical significance, p-value 0.000). Bank credits to the private sector as a main source for financing investment in CEE counties have important role for economic growth. Countries with market oriented financial sector which give support to private sector and businesses have better chance for economic growth. This conclusion can be proved by econometric results that we have obtained, efficiency of the financial sector presented by bank credit to private sector is positively and statistically significant correlated with economic growth in our sample of countries over the period (1992-2007).

The most serious problems that we have addressed in the FE model (by Pasaran and modified Wald test) are the present of cross sectional independence (the correlation of residual among entities) i.e. contemporaneous correlation and groupwise heteroskedasticity (not constant variance). We used Driscoll-Kraay standard errors to overcome the contemporaneous correlation and robust standard errors to overcome the heteroskedasticity.

Our estimation might be biased due to counties' fixed effects and endogenity problems on the explanatory variables. We tackle these issues by including internal instruments (GMM). The Sargan test for over identifying restrictions do not reject the null hypothesis that our instruments are appropriate, indicate that the GMM estimation is consistent. Additionally, the comparison of Columns (1) with fixed effects, (2) with random effects, and (3) with GMM allows us to identify that the use of the GMM estimators confirm the positive impact of institutional quality on economic growth. While the coefficient on institutional quality obtained with the GMM

estimator appears smaller, it is not significantly different from the one obtained based on fixed and random effects. This suggests that our indicator does not suffer from endogeneity problems. The strong link between export sophistication and growth does not appear to be driven by simultaneity bias.

## 4   Institutions and Economic Growth in CEE Region during Global Economic Crisis

The process of EU integration has required building a strong institutional capacity with new institutions appropriate to EU standards such as competition agencies, reform in the existing institutions and many others. The pre-condition for this process is harmonization of the system of laws to the *acquis communautaire.* There are many studies which have shown that the progress in EU integration has a positive effect on institutional quality measured by EBRD Transition Indicators and World Governance Indicators on one side, and the quality of institutions and economic growth, on the other. Consequently, countries which have made significant progress in adopting EU-compatible and market oriented reforms in the period before the crisis and as a result have become EU members, have had a higher average economic growth. However, the central issue in this paper is *how institutions influence economic growth during global economic crisis period in this region*?

| EU membership | Country | Average GDP growth 2008-2011 | WGI | EBRD Index |
|---|---|---|---|---|
| EU Members | Bulgaria, Croatia, Hungary, Latvia, Romania, Slovenia | -0.37 | 0.53 | 3.74 |
| Non-EU Members | Albania, Macedonia, Serbia, Turkey | 2.39 | -0.11 | 3.39 |

***Table.4*** *EU membership, the average GDP growth, WGI and EBRD index*

Table 4. above shows that EU member countries with higher quality of institutions measured by EBRD Transition Indicators Index and WGI were adversely affected by the economic crisis with negative average rate of economic growth (-0.37%). On the other side, countries which have lagged in EU integration process and in the process of strengthening the institutional capacity were not seriously affected by the crisis. The average rate of economic growth of non-EU members (2.39%) during economic crisis was significantly higher than the average growth of EU member countries.

The second regression model that we have estimated uses different set of variables to represent the quality of institutions (WGI, EBRD Transition Indicators, EU integration), for the time period during global economic crisis. The econometric equations that we estimate have the following structure:

$$g = \gamma_0 + \gamma_1 WGI + \gamma_2 Openn + \gamma_3 Inf + \gamma_4 Invest + \gamma_5 FDI + \varepsilon_i \tag{8}$$

$$g = \gamma_0 + \gamma_1 EBRDIndex + \gamma_2 Openn + \gamma_3 Inf + \gamma_4 Invest + \gamma_5 FDI + \varepsilon_i \tag{9}$$

| **DEPENDENT VARIABLES**: Economic growth per capita | (1) OLS Panel regression | (2) Random-effects GLS regression | (3) OLS Panel regression | (4) Random-effects GLS regression |
|---|---|---|---|---|
| INDEPENDENT VARIABLES: | | | | |
| Openness | 0.0940** (0.0366) | 0.134*** (0.0441) | 0.0399 (0.0293) | 0.0588 (0.0360) |
| Inflation | -0.328 (1.278) | -1.445 (1.433) | -0.314 (1.401) | -1.283 (1.543) |
| FDI | 1.654** (0.739) | 2.094** (0.880) | 0.608 (0.661) | 0.807 (0.771) |
| Investment | 6.449** (3.063) | 7.711** (3.557) | 8.852*** (3.034) | 10.83*** (3.448) |
| WGI | -1.931*** (2.357) | -3.441*** (3.099) | | |
| EBRD Index | | | -1.585*** (3.798) | -3.083*** (4.868) |
| Constant | -53.79*** (13.79) | -66.82*** (14.73) | -33.58** (15.80) | -38.31* (19.68) |
| Observations | 64 | 62 | 66 | 64 |
| R-squared | 0.456 | 0.583 | 0.358 | 0.409 |

Standard errors in parentheses
*** p<0.01, ** p<0.05, * p<0.1

***Table.5*** *Results for the OLS, fixed and random effects model estimation for the second model*

The results show that the quality of institutions measured by the WGI and the EBRD Transition Indicators has had a negative impact on economic growth during global economic crisis period, which is at least controversial. The logical explanation of the negative impact of institutional quality rests upon the fact that countries in the CEE region which have made the most significant institutional progress by integration to the EU were more vulnerable to the crisis. This sensitivity and vulnerability to the crisis primarily came from the higher degree of openness to the transmission effects through financial flows and falling export demand. But, at the same time they have better chance to overcome the crisis and better opportunities for recovering their economies, since private sector in those countries operate within a more supportive and market oriented institutional environment.

The regression results show negative correlation between institutional quality measured by World Government Indicators (voice and accountability, political stability and absence of violence, rule of laws, index of corruption, government efficiency and regulatory quality) and EBRD transitional index (large and small scale privatization, governance and enterprise restructuring, price liberalization, trade and foreign exchange system and competition policy) and economic growth in the period during the world financial and economic crisis.

The graphical presentation on a scatter plot visualizes the negative partial correlation and interdependence between institutional quality measured by WGI and the rate of economic growth over the global economic crisis period. The countries that have succeeded in the creation of comprehensive and EU-compatible institutional environment were more sensible to the shocks as a result of global economic crisis, and vice-versa. Slovenia, Latvia, Croatia, Bulgaria and Romania as countries with higher degree of financial and EU integration have had a slower economic growth compared to the Republic of Macedonia, Serbia, Turkey, Russia and Albania.

# Strategic Determinants for Managing the Optimal Changes in the Model for Sustainable Growth

Prof. Dr. Ljubomir Drakulevski (Ss. Cyril and Methodius University, Macedonia)
Asst. Prof. Dr. Leonid Nakov (Ss. Cyril and Methodius University, Macedonia)

## Abstract

The prior importance of the concept of sustainability, as well as its prior developmental orientation, is one of the most challenging and prospective approaches to a more systematic and a less chaotic organizational and economic growth and development. With the process of launching the "New Global Reporting Initiative", in August 2010, the awareness for a profound integration of the needed data and information on the model for sustainable growth emerged, consisting of a numerous initiative organizations, such as UN Global Compact and WWF, the Prince's Accounting for Sustainable Projects, International finance and accounting standard settlers, which in fact establish a concept of comparable integrated sustainable framework. The dominant importance of the above framework is unifying the information for running the day-to-day operation in a sustainable manner, in order to emphasize the focal understanding of the sustainability as triple bottom line aspects – the balance of harmony between the economic, social and environmental sustainability. Each organizational form nowadays possesses a need for complying its performance as a dynamic, vital and alive entity, in order to shift the prevalent consideration of the human resources from a source of value creation, to a focal creative force within, as an initial step for a vivid responding to the features of the new organizational evolution. The systemic approach to planning and implementing changes is the base for the tendencies of an external adaptation and internal integration.

## 1    Creating Strategic Capability for Optimal Systems Change

The prevalent issue for optimizing the direction and intensity of every sustainable growth, especially the organizational one, refers to the need for *harmonizing the values and virtues of the sustainability with the interests of the constituencies (economic, environmental and social) and the strategic organizational determinants, especially the dimension of the strategic choice*. On an organizational level, *the industrial ecology, eco-efficiency and the strategic pro-activity* (McDonough and Braungart, 2002) constitute the critical elements for satisfying the increasing importance of strategic determination of the scope and nature of the planned organizational changes, particularly to the optimal changes. Their integration leads to the model of *dynamic co-evolution towards sustainability*, which is especially important in societies where accepted business practices could potentially result in a non-compliance with the social and environmental consequences of the profitable change initiatives.

The model for sustainable organizational development shifts the traditional paradigm for perceiving this process as focused only on full achievement on the mission and building and maintaining the long-term organizational capacity, which relies on the behavioral usage of the obtained knowledge and experience for the planned systemic character of the organizational processes. The focal problem of this approach is its constrained potential for managing the complex and dynamic nature of the needed balance of interests among the natural environments, the organization and its employees (Law, 2004).

In order to create and further enhance the model for managing the changes and development, the developmental issues from the so called third generation of the organizational development (Seo et al., 2004) pay particular attention to the importance of the advanced sustainable growth concepts, such as the appreciative inquiry, the learning organization, process interventions such as open space technology aimed at transformational change (Benn & Baker, 2009). In its essence, the appreciative inquiry is affected through the action research programs, the learning organization through the throughput segment of the systemic model, whereas the process interventions predominantly refer to the business process reengineering concept.

The process of creating strategic capability for optimal systems change is initiated with the pre-conditions for an optimal changes, which is related to enabling the usage of the following key elements:

- Complex and adaptive systems thinking - CAS (Benn & Baker, 2009);
- Collective accountability and sustainable change (Linkins et al., 2013);
- SIDA twinning method for organizational learning (Jones, 2001).

*Complex and adaptive systems thinking* – CAS in fact implies to a network of interdependent, complex and highly interactive network of change agents within and outside of the enterprise, which are mutually connected by common and shared interests, motives, goals and attitudes. The intention of their creation is to broaden the perspective for the change, from a linear, fragmented and mechanistic one, to a non-linear, integrated and organic character, in order to enable the model for a *collective action for innovation*, both of the enterprise and the

society at the same time. It is only possible if the enterprise reaches its *developmental phases*, the moments of actual implementation of the proposed changes.

The dimension *collective accountability and sustainable change* is placed on the top of the pyramid of building blocks for a systems change, which is a very sensitive element in building the relationship between the enterprise and the society, from *partnership to collective accountability*, on the following way:

*Figure 1. The Building Blocks of Systems Change **Source:** Adopted according to Linkins W. Karen et al.*

In this element, the very *collective accountability* underlines a far deeper and broader internal and external commitment of every company to the process of managing the optimal changes, starting from the content understanding of the problem, through building the capacity for balancing the interests, up to the level of establishing the *sustainable change*, in terms of harmonizing the buy-in with the integration of the culture change with the policies and practices. The *potential obstacles to collective accountability* usually include lack of change champions and experience, extreme accent to the resource control, lack of accountability for quality dimensions of the outcomes, professional training and development which is not focused on the participation and collaboration, but on professional expertise, internal competition across various organizational units etc.

*SIDA twinning method for organizational learning* is one of the most prominent sustainable change techniques, created as a direct response to the deficiencies of the conventional technical models which rely on extensive infrastructural support along with the formal education and training of key individuals, in the relations of the developing countries, as Macedonia, with Sweden. It precisely stipulates that the *key to the strategic treatment of the organizational change process* lies in the integral development of the organizations, on a micro level, as well as to the institutions, on a macro level. The ultimate goal is to determine as many cooperation fields as possible and sharing each other experience and expertise.

The integration of the above detailed pre-conditions for optimal changes is effected through the *principles for improving the long-term capability for change* (Beer & Eisenstat, 1996):

1. *The change process should be systemic* – evident need for ensuring alignment between all critical elements of the organizational design should be conducted by application of the dialectic or conflictive approach to change*;*

2. *The change process should encourage the open discussion of barriers to effective strategy and adaptation* – focuses on the necessity for an interactive understanding process of reaching a mutually acceptable understanding of the problem, in which a clear distinction of major and minor problems would enable the categorization of the change management models compared to small interventions and routine adjustments within the system*;*

3. *The change process should develop partnership among all relevant stakeholders* – collective accountability, as well as the adaptive systems thinking would not produce the desired results, if is not established a closer interaction of the enterprise with all key stakeholders. This collaboration is particularly important in times of potential various interpretations of the internal and external implications of a certain managerial actions.

In the first principle, an effective leadership is required; in the second the usage of change agents is of a central importance, whereas in the third one, a common understanding of the indicators for the entire, not only the organizational, quality of the performance is of an utmost importance.

Strategic approaches to overcoming the barriers for collective accountability include various ranges of techniques, out of which the prevalent ones (Kramer, 2009) include the following:

- Taking responsibility for achieving results;
- Mobilize a campaign for change;
- Use all available tools and
- Create actionable knowledge.

Therefore, a mutual collective responsibility, through a detailed action change programs, with a series of available tools that are constrained by the actual resource and capability scope and nature, would lead to a new, structured and applicative knowledge.

## 2   Managing the Model of Sustainable Changes and Development

Every prosperous organization, in attempting to create and manage a model of sustainable changes and development, faces a clear need for a proper fulfillment of the following *dilemmas for sustainability* (Bloodgood & Morrow, 2003):

- Specific strategic choice for their optimal changes must be comprised of the actual environmental structure, internal conscious awareness and knowledge;
- The applicative strategic choice would always reflect one of the change strategies, far more than their combination.

The compliance of the resource allocation within the selected change strategy leads to enhanced usage of the knowledge in accordance with the degree of the internal conscious awareness. As a result, the mechanisms for a more solid corporate governance, as well as the controlling process become more vital, leading to a higher overall organizational performance.

The most commonly used method for an *optimal combination of the elements of the strategic choice* refers to continuous knowledge transfer, transparent environmental consequences of the change action programs and a resource reconfiguration according to the features of the new organizational and social paradigm for change. The emerging of this modern paradigm is derived from the need for urging changes in the *key characteristics of the management model aimed at achieving the optimal changes* (Bulc, 2012), consisting of the following:

- Sustainability and sustainable development;
- Technologies;
- Innovation and
- New structures and leadership styles.

The concept of *sustainability and sustainable development* are best described through the following determinations, meaning that the sustainability, on one hand, is about integrating (Dyllick & Hockerts, 2002) the following *elements*:

- Economical, environmental and social aspects – the triple aspects;
- Short-term and long-term aspects;
- The process of consuming the income, not the capital.

The model of sustainable development, on the other hand, incorporates the *methods for achieving the following elements*:

- Balancing the triple aspects for the welfare of the current and future generations (World Commission on Environmental and Development);
- Commitment to the long-term results of the responsible actions on a daily basis and the development of long-term processes in harmony with nature (Bulc, 2012);
- Sustainable work systems referred to as 'regenerative work', in terms of the resources of the employees, rather than diminishing them, development of both human and social resources (Kira & Forslin, 2008).

The same way as human beings develop themselves in physical, emotional and mental aspects, the advancement of the enterprises must possess the holistic concept in which, the external constraints influence the re-direction of resources, with an ultimate aim of material and non-material prosperity.

The importance of applying a *proper and advanced technology* obviously has its internal, as well as external perspective of consequences. The fundamental issue in changing the used technology of every enterprise implies

to the potential changes in organizational, infrastructure and administrative requirements, which in return create a more frequent orientation for an evolutionary – incremental approach for technology changes, relying on step-by-step enhancing the employee capabilities and competencies.

At the same time, actual technology of an enterprise reflects the relationship of the dominant organizational structures and systems, which is crucial for the distribution of authorities, power and influence, not only internally in the organization, but also in the processes of cooperation and support with the external stakeholders.

Changes of the technology influence the direction and character of the individual, group/team and the organizational sustained growth and development. In this context, the advancement of the technology may be far above or below the competences of the work force, or it may be vice versa. In both cases, the lack of congruency should never be an obstacle for planned technology changes, which are expected to accomplish, in our profound analyses, the following *challenges*:

- Integrate and optimize the development path of the technology within the prevalent organizational culture, as well as
- Determine and harmonize the technological changes with the relationship of the actual and desired level of the organizational sustainability.

With regards to the model for sustainable growth, the technology is expected to include the local, regional and national constraints to the sustainability within the processes of its ongoing development, in order to create a basis for a competitive advantage.

The third characteristic for achieving the optimal changes refers to the particular treatment, current and potential, of the *innovation*, analyzed both as a process and as a desired outcome. The classical approach to the innovation is concentrated on a wide range of critical-to-success stakeholders, especially to the customers, suppliers, competing innovators, regulatory bodies, media, managers and shareholders. The prevalent model of analyzing the companies' innovative tendencies relies on the cognitive approach, in terms that their perception of the influence of the innovation to the overall social and environmental development is more important than the actual innovation potential.

Innovation is in the essence of both the effectiveness and efficiency and it implies that the changes of the innovative model must me well managed. The specific character of the innovation and especially it's relation and influence to the sustainable development leads to creating a separate *strategy for innovative development*, in which the integration of the internal with the external demands often seem to be exhausting and resource consuming. This has been widely implemented by the trans-national companies, such as DuPont Co., which publicly announced and reduced the gas emission, by 2010, by two-thirds, while at the same time maintaining the energy usage to the 1990 levels.

The focal sustainable dimension at the innovation undoubtedly is its *development potential*. This innovative concept involves transparent determination of the capacity of the innovative process for an organizational transition or transformation, varying on the extensive usage of the transactional or transformational change modality. The *influence of the innovation towards the sustainable growth and development* is measured by the achieved, not by the perceived, changes in applicative clearing up of the obstacles, negative tendencies, withdrawals as well as to the behavioral constraints, for an intensive application of planned and continuous changes. It is in fact, an initial pre-condition for the model of sustaining the organizational growth and development.

Each and every innovation possesses various *influencing potential* to the sustainable innovative process. In this context, for instance, *technological innovation* not always bears the characteristics of an innovation for sustainable development, especially owing to non-compliance of the interests of the triple aspects model. Therefore, changes in the innovative process must be driven and conducted in accordance with the organizational goals of the optimal changes, and at the same time with the major causes of social and environmental disruptions.

The innovation itself, *adds value not only to the processes*, *but also to the internal and external relations* across the company and along with the environment. It is of a fundamental importance to emphasize *that primary initiative for measuring the sustainability have been developed within the Global Reporting Initiative (GRI)*, where the mail goal is to determine the link between the sustainability and the economic value of the enterprise, especially whether it is present in everyday managerial actions. In other words, *the cost of the capital, analyzed as an investment from the entire financial community in the corporation, must be surpassed by the output of using the capital resources*.

The concept of *Economic Value Added (EVA)* (Bardy& Massaro, 2012) stipulate that it is possible to measure the overall corporate performance by claiming that shareholders gain when *the return from the capital employed in a corporation is greater than the cost of the same capital*. It's advantage lies in the fact that it is possible to *measure and implement the sustainability* at site levels, industry level, division level, regional level and national level, whereas *sustainable development is mainly a macro-level concept at the global level* (Jasch, 2006).

The *integrative usage of the ecological and social resources*, predominantly through the degree of their nominal and real availability, leads to finding out the *corporate contribution to sustainability*, in terms that it is expected to use them on a more efficient level, if they pledge to be treated as a *sustainable capital*, as a monetary indicator of the sustainability.

The ultimate indicator from the models of adding value tends to be the concept of *Sustainable Value Added (SVA)*, which is calculated when we take the Economic Value Added (EVA) and deduct the cost of capital employed in ecological resources and the cost of capital employed in social resources. In a word, it is the net economic outcome from the invested capital in the sustainability.

Both above detailed value based sustainability approaches are widely applied in numerous countries of the European Union, such as in Denmark, Sweden etc. The achieved results confirm the prior assumptions than *the model of sustainable growth does not only waste value, but adds value*, especially in the managerial actions where the interests of preserving and developing the environment, and the treatment, training and performance enhancement of the employees is high on the managerial operating agenda.

Inevitably, *innovation is the key characteristic for achieving optimal change*, in which the transformational potential creates the added value, within the prevalent model of awareness and consciousness, and the efficient allocation of the available resources. Therefore, the *adoption of the innovation is dependent by various factors*, among which *the shareholders complexity, the shareholders ambiguity and the sustainable development pressure* (Hall & Vredenburg, 2013) plays the highest importance.

In order to determine *the potential of the innovation towards the optimal change within the model of sustainable growth*, the focal dimension is to analyze the counter relationship between their *stimulating forces*, on one hand, and their *orientation towards the competitive recognition*, on the other hand. With regards to the *stimulating forces*, the distinction is on:

- Market-driven innovation and
- Public-policy driven innovation.

The competitive recognition varies from the modalities of influencing the following *competitive dimensions*:

- Competitive advantage or
- Competitive disruption.

Their *integration* is analyzed on the following way:

|  | Market-Driven Innovation Stimulus | Public-Policy-Driven Innovation Stimulus |
|---|---|---|
| Opportunity for Competitive Advantage | EXPLOIT CUSTOMER NEED - *New or improved products/services* | EXPLOIT SOCIETAL NEEDS - *Wealth creation, Energy security, National and Regional Economic development or Environmental protection* |
| Opportunity for Competitive Disruption | RISK OF FAILURE AND OBSOLESCENCE - *Uncompetitive technology or Business practice* | RISK OF SOCIETAL TURMOIL - *Environmental degradation or Social inequalities* |

*Table 1.The Double-Edged Sword of Innovation **Source:** Hall Jeremy & Harry Vredenburg*

In order to satisfy at the same time the needs of the organization, employees and the environment, *management should concentrate on both, left and right side* of the detailed Table 1.1., especially owing to the fact that business executives traditionally focus on the left side, whereas the policy-makers on the rights side of it. The key for a more thorough and integrating application of the above Table lies in the prevailing concept of the development of the skills and competencies of all the employees, including the managers, meaning that *the enterprise has a need for internally and externally unifying the sources of competitiveness with the fundamental interests of all key stakeholders for the sustainable development*.

The final characteristic of the managerial model for achieving optimal changes are the *new structures and leadership style*. The tendency of every open organizational system should be placed in *adjusting the changes within all structures*, not only in the organizational scheme, to the existing and future needs of all interest parties from the enterprise.

Therefore, the *structural changes* are expected to reflect the changes which are required for sustained concept of managing the optimal changes, a fact that in return constitutes the need for an anticipative determination of the scope and the direction of those changes for more flexible and adaptive structures. At the same time, the model of leadership style defines the character of the relations of the leaders towards their followers, a moment which should add stimulus and new energy at all employees, particularly to integrating the previous 3

characteristics for achieving the optimal change. The *leadership changes* must be focused on the development of the concept *leadership within*, which enables the enterprise to function as a dynamic and agile system, with a prior focus on constant sustainable changes for the desired level of transition or transformation, through collective, not individual consciousness and awareness.

The key for the changes for new structures and leadership style is placed in the *concept of transition from learning to a thinking environment,* what underlines the fact that contemporary managers are not expected to manage only the source of creating the value, but also the generating segment of the value creation, i.e. the environment.

In essence, an organization, while attempting to reach an optimal change for a sustainable growth, should create a *continuous change program*, not an episodic, or an incidental one. In this program, managers are about to implement the concept of *stakeholders interest balance* (Beer & Nohria, 2000), through the priorities of the created model for sustainable development, internal and external. In this matter, it is essential to distinct the following *sustainable pathways points*:

- Clear differentiation of the strategy for creating - predominantly bottom up, to the strategy for maintaining or sustaining the change - predominantly top down (Meyer & Stensaker, 2006);

- In the implementation stage of managing the optimal change, a discrete change should come first, and followed by a continuous changes (Buchanan et al., 2005);

- The optimal character of the change lies in the sustainability of the continuous change programs, which is determined by the following enablers for long-term effect of the optimal change (Swensson, 2007):
    - Managerial ownership to the change initiative;
    - Professional steering of the change process;
    - Competent leadership; and
    - Engaged participants.

The integration of above enablers enacts actual measurement of the sustainability of the optimal changes and positively influence to the competitive advantage of the enterprise.

## 3 Conclusion

The prior importance of the concept of sustainability in the contemporary economy and society as a whole, as well as it's prior orientation in the function of creating a model for managing an optimal changes and growth is one of the most challenging and prospective approaches to a thorough and consistent necessity for a more systematic and a less chaotic organizational and economic growth and development.

The prevalent issue for optimizing the direction and intensity of every sustainable growth, especially the organizational one, refers to the need for harmonizing the values and virtues of the sustainability with the interests of the constituencies (economic, environmental and social) and the strategic organizational determinants, especially the dimension of the strategic choice.

The process of creating strategic capability for optimal systems change is initiated with the pre-conditions for an optimal changes, which is related to enabling the usage of the following key elements - complex and adaptive systems thinking - CAS, collective accountability and sustainable change and SIDA twinning method for organizational learning. The potential obstacles to collective accountability usually include lack of change champions and experience, extreme accent to the resource control, lack of accountability for quality dimensions of the outcomes, professional training and development which is not focused on the participation and collaboration, but on professional expertise, internal competition across various organizational units etc.

The emerging of the modern paradigm of strategic choice is derived from the need for urging changes in the key characteristics of the management model aimed at achieving the optimal changes, consisting of the sustainability and sustainable development, technologies, innovation and new structures and leadership styles. The innovation itself, adds value not only to the processes, but also to the internal and external relations across the company and along with the environment. It is of a fundamental importance to emphasize that primary initiative for measuring the sustainability have been developed within the Global Reporting Initiative (GRI), where the mail goal is to determine the link between the sustainability and the economic value of the enterprise, especially whether it is present in everyday managerial actions. In other words, the cost of the capital, analyzed as an investment from the entire financial community in the corporation, must be surpassed by the output of using the capital resources.

The optimal character of the change lies in the sustainability of the continuous change programs, which is determined by the following enablers for long-term effect of the optimal change - managerial ownership to the change initiative, professional steering of the change process, competent leadership and engaged participants.

# Purchasing Power Parity in Commonwealth of Independent States

Asst. Prof. Dr. Gülçin Güreşçi Pehlivan (Dokuz Eylül University, Turkey)

Ph.D. Candidate Esra Ballı (Çukurova University, Turkey)

Prof. Dr. Muammer Tekeoğlu (Çukurova University, Turkey)

## Abstract

The Purchasing Power Parity suggests that differences in relative prices in two countries move together with nominal exchange rates in the long run. This study examines the validity of PPP as transition economies for Commonwealth of Independent States (CIS). Purchasing Power Parity holds only when the real exchange rate is stationary in the equation. To test the stationary, we used both time series and panel data analysis. Testing unit root both with time series and panel data in this study, provides us double check of the results. We also test the cross sectional dependence to choose the appropriate panel unit root test. Our test statistics indicate that there is cross section dependence between countries. Hence, one needs to take into consideration the cross section dependence while undertaking unit root tests. Otherwise, the results would be biased. ADF and KPPS indicate that PPP cannot be accepted for the countries except for Russia. According to the panel unit root test results indicate that PPP does not hold for Armenia, Belarus, Georgia, Kazakhstan and Kyrgyzstan except for Russia.

## 1 Introduction

Purchasing Power Parity (PPP) is of importance for economics. Several empirical studies have implemented to test the validity of PPP hypothesis for different countries. As Commonwealth of Independent States (CIS)' countries are in the process of transition for the market economy it is important to examine whether PPP holds for these countries because of its economic implications. CIS' liberalization programs started in the early 1990s. Most countries dealt with the drastic increases in budget deficits, debts and inflation. Several institutional and structural adjustments that occurred in transition countries have undergone several phases of economic changes.

There is a great deal of literature on PPP and some of the studies with the several methodologies have implemented to test the validity of PPP in the long run Empirical evidence on the stationarity of real exchange rates for transition economies is abundant. The most common approach in testing the PPP hypothesis is to utilize the unit root test(s) on the real exchange series Choudhry (1999) examined PPP for Poland, Romania, Russia and Slovenia using us fractional and Harris-Inder cointegration tests from 1991 to 1996/97. He found some evidence to support relative PPP for Russia and Slovenia. Barlow (2003) investigated three transition economies including Poland, the Czech Republic and Romania to examine the PPP using cointegration analysis for the period of April 1994 to December 2000. He found mixed results for these countries.

Payne et al. (2005) examined the validity of PPP for a transition economy, Croatia, using monthly data from the period of January 1992 to October 1999. They did not find evidence in support of PPP for Croatia. Chang and Tzeng (2011) tested the asymmetric adjustment on long-run purchasing power parity in nine transition countries including Russia between January 1995 and December 2008 period using a threshold cointegration test. They found strong evidence of long-run PPP for these countries and the adjustment mechanism was asymmetric.

Acaravci and Ozturk (2010) examine the validity of the PPP in eight transition countries for monthly data from 1992 to 2009. They found weak evidence to support long-run PPP. Tkalec and Vizek (2011) examined the validity of PPP hypothesis for Croatia utilizing Johansen cointegration and threshold cointegration tests from January 1996 to October 2010. They found that absolute power parity condition holds in the long run. He et al. (2013) test the long-run purchasing power parity in the transition economies, which are Bulgaria, the Czech Republic, Hungary, Latvia, Lithuania, Poland, Romanian, and Russia, for the period from January 1995 to October 2011 using panel unit root test. The results show that the PPP does not hold for Hungary, the Czech Republic and Russia.

Lu et al. (2012) examine the validity of long-run Purchasing Power Parity (PPP) for a sample of transition countries including Russia for the period from January 1995 to December 2008 using autoregressive distributed lag test for threshold cointegration. They found an evidence of PPP for Estonia, Hungary, Poland, Romania and Russia. Hasanov and Teletar (2009) test the validity of PPP for CIS countries using the annual output growth rates and inflation rates for the period from 1992 to 2005. They found evidence that support PPP for these economies. Varamini and Lisachuk (1998) examined PPP for Ukraine using monthly data from March 1992 to August 1996 utilizing Engle-Granger test. They found some evidence in favor of PPP.

Solakoglu (2006) examined the validity of PPP for 21 transition countries for 12 years of unbalanced annual data using panel unit root tests. She found that that PPP holds for Armenia, Azerbaijan, Georgia, Kazakhstan, Kyrgyzstan, Moldova, Russia and Ukraine. Doganlar (2006) tested the PPP for Azerbaijan, Kazakhstan and Kyrgyzstan using monthly data from 1995 to 2002 employing the cointegration analysis. He found no evidence

for PPP for these countries. Apergis (2003) examined PPP for Armenia using monthly data from 1993 to 1996 utilizing OLS test. He found no evidence in favor of PPP.

Sideris (2006) tests PPP for 17 European transition countries, including Belarus, Georgia, Moldova, Russia and Ukraine utilizing the Johansen cointegration methodology for the period of 1995 to 2004 for CIS countries. He found no evidence for Belarus, Georgia, but weak evidence for Moldova, Russia and Ukraine. Bekő and Boršič (2007) examined PPP for the Czech Republic, Hungary and Slovenia vis-à-vis Austria, Germany, France and Italy with using monthly data from January 1992 to December 2006. They found no evidence of PPP.

Chang et al. (2011) examine the validity of long-run purchasing power parity (PPP) using nonlinear cointegration for nine transition countries, Bulgaria, the Republic of Czech, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, and Russia, from January 1995 to December 2008. They found evidence in favor for PPP for all countries. Hung and Weng (2011) test the validity of the PPP for Azerbaijan, Kyrgyzstan and Kazakhstan vis-à-vis Russia utilizing cross-section correlations of panel unit root tests. They found significant support for the PPP for these countries when taking into consideration of the cross-sectional dependence on panel unit root tests.

The paper is organized as follows. The next section explains the theoretical model on purchasing power parity the third section presents data and empirical methodology, the fourth concludes.

## 2    Theoretical Model on Purchasing Power Parity

Purchasing Power Parity (PPP) is a theory of exchange rate determination. The PPP proposition asserts that differences in relative prices in two countries move together with nominal exchange rates in the long run.

$$q_t = e_t - p_t + p_t^* \tag{1}$$

$e_t$, $p_t$, $p_t^*$ denote the logarithms of the nominal exchange rate, domestic price level and foreign price level at time t. To test the random walk hypothesis we used following equation. PPP holds only when the real exchange rate is stationary in this equation.

$$q_t = \alpha + \rho q_{t-1} + u_t \tag{2}$$

PPP does not hold in the long run in the presence of unit root in the real exchange rate series. If the PPP holds, it indicates that nominal exchange rate revised for inflation differences. There are many macroeconomic implications in the case of non-stationarity in real exchange rates. For example, Dornbusch (1987) remarked that real exchange rate depreciation can increase international competitiveness of country, shifting the employment from appreciating country to the other country. Besides that, PPP is an essential element for the establishing the level of an exchange rate.

## 3    Data and Empirical Methodology

### Data

In this paper Augmented Dickey Fuller (ADF), Kwiatkowski–Phillips–Schmidt–Shin (KPSS) and panel unit root tests are employed. Before applying panel unit root tests for the series, heterogeneity and cross sectional dependence tests are used. The annual data set covers for the panel test covers the period from 2000 to 2011. For the ADF and KPSS tests are used different periods because of the data availability. The critical values for the rejection of the null hypothesis of a unit root are those computed according to the McKinnon criterion (1991). The lag length for the ADF test is based on the akaike information criteria.. The sample period of Belarus and Georgia is 1996M1-2013M11; for Kyrgyzstan 2000M1-2013M9; for Kazakhstan 1995M1-2013M10 for Russia 1994M1-2013M06 and for Armenia 1997M1-2013M10. All data is collected from the Central Bank of the selected countries. The exchange rate regime of Armenia is floating, for Belarus, Georgia, Kyrgyzstan and Russia is managed float and for Kazakhstan is pegged to US dollar. All variables are converted into natural logarithm

An Augmented Dickey-Fuller (ADF) test is a version of the Dickey-Fuller test for a larger and more complicated set of time series models. ADF test has been developed to test univariate time series for the presence of unit roots or non-stationarity. ADF test can be expressed as:

$$\Delta Y_t = \mu + \gamma Y_{t-1} + \sum_{j=1}^{p} \alpha_j \Delta Y_{t-j} + \beta t + \omega_t \tag{3}$$

where $\mu$ is the drift term, $t$ denotes the time trend, and $p$ is the largest lag length used. The null hypothesis and alternative hypothesis of the Augmented Dickey-Fuller t-test are:

$$H_0 : \gamma = 0$$
$$H_1 : \gamma = 0 \tag{4}$$

If $H_0$ is rejected we simply conclude that $Y_t$ does not contain a unit root. Kwiatkowski, Phillips, Schmidt and Shin (KPSS) developed a unit root test. This test's null hypothesis is different from others and shows the stationarity. If $H_0$ is rejected we simply conclude that $Y_t$ does contain a unit root.

| | ADF | | | | | | KPSS | |
| | Model A | | Model B | | Model C | | | |
| Variables | $k$ | $t_{(\gamma)}$ | $k$ | $t_{(\gamma)}$ | $k$ | $t(\gamma)$ | $\eta_\mu$ | $\eta_\tau$ |
|---|---|---|---|---|---|---|---|---|

*Table 1. ADF and KPSS Unit Root Tests*

Tables 1 reports the results of these two conventional unit root tests for real exchange rates using ADF, and the KPSS tests. ADF test results indicate that the real exchange rates are non-stationary for Armenia, Belarus, Georgia, Kazakhstan and Kyrgyzstan that is inconsistent with PPP proposition. However, for Russia the real exchange rate series is stationary at all significant level. KPSS test results are consistent with ADF.

| Variable | Test Statistics |
|---|---|
| P | 24.197*** |

Note: *** indicates that the coefficient is significant at 1%.

*Table 2. Cross Sectional Dependence Test (CD$_{LM}$ Test)*

Before implementing the unit root tests, firstly we determine the cross sectional independence between variables. To test cross section dependence, test statistics is computed as follows Pesaran (2004):

$$CD = \sqrt{\frac{2T}{N(N-1)}}\left(\sum_{i=1}^{N-1}\sum_{j=i+1}^{N}\hat{\rho}_{ij}\right) \tag{5}$$

$CD$ statistic of Pesaran has mean zero for fixed values of $T$ and $N$, where $N$ indicates cross section dimension, $T$ is time dimension of panel, $\hat{\rho}_{ij}$ represents the sample estimate of the cross sectional correlations among residuals. The hypothesis for the computed test statistics are:

$$H_0 : \rho_{ij} = \rho_{ji} = cor(\varepsilon_{2,it}, \varepsilon_{2,jt}) = 0$$
$$H_1 : \rho_{ij} = \rho_{ji} \neq 0 \tag{6}$$

According to Table 2 there is a cross sectional dependence between series in the case of the null hypothesis is rejected. Therefore, it requires to use the unit root test which take into consideration of the cross sectional dependence. Otherwise, the results will be biased. Covariate Augmented *Dickey-Fuller* (CADF) test of Pesaran can be used as a unit root test under the cross section dependence. The null and alternative hypotheses of the CADF test are shown below:

$$H_0 : \beta_j = 0$$
$$H_1 : \beta_j < 0 \quad j = 1,2,..,N_1; \ \beta_j = 0, \ j = N_1 + 1, \ N_1 + 2,...,N \tag{7}$$

where $N$ indicates number of cross sections. CADF regression is shown below Pesaran (2007):

$$\Delta y_{it} = a_i + b_i y_{i,t-1} + c_i \bar{y}_{t-1} + d_i \Delta \bar{y}_t + e_{1,it} \tag{8}$$

where $\Delta y_{it} = y_{it} - y_{i,t-1}$; $y_{i,t-1}$ is the first lag of $y_{it}$ ; $\Delta \bar{y}_t$ is cross-section mean of $\Delta y_t$ and $e_{1,it}$ is residuals. The computed test statistics require to be compared with Pesaran (2007) table values.

| Countries | CADF | LAGS |
|---|---|---|
| Belarus | -22.089 | 2 |
| Armenia | -18.733 | 3 |
| Georgia | -2.411 | 3 |
| Kazakhstan | -28.699 | 2 |
| Kyrgyzstan | -24.348 | 2 |
| Russia | -37.686 | 2 |

***Table 3***: *CADF Test Results*

Table 3 shows that null hypothesis of non-stationary is not rejected at 1%, 5%, 10% levels and there is a unit root for all countries except Russia. For Russia at %1 level there is not a unit root but %5 and %10 levels there seems to have a unit root. CADF test results are consistent with ADF and KPSS test results. As regards all test results PPP does not hold for all countries excluding Russia.

## 4   Conclusion

In this study the validity of the PPP hypothesis examined for six CIS countries. Long-run validity of the PPP was tested by stationary of the real exchange rate series by employing ADF, KPSS and panel unit root tests. ADF and KPPS indicate that PPP cannot be accepted for the countries except for Russia. According to the panel unit root test results indicate that PPP does not hold for Armenia, Belarus, Georgia, Kazakhstan and Kyrgyzstan except for Russia. There are many macroeconomic implications in the case of non-stationarity in real exchange rates. For example, Dornbusch (1987) remarked that real exchange rate depreciation can increase international competitiveness of country, shifting the employment from appreciating country to the other country. Besides that, PPP is an essential element for the establishing the level of an exchange rate. In addition, Halpern and Wyplosz (1997) indicate that as the service sector suppressed under the command economy, the raising of services can lead to real exchange rate appreciation of country during the transition. Further, this paper will be expanded with the tests taking into consideration of structural changes for these countries.

# Economic Growth in the Axis of Human Capital, R&D and Innovation: An Analysis on the G8 Countries

Ph.D. Candidate Mustafa Gömleksiz (Necmettin Erbakan University, Turkey)
Assoc. Prof. Dr. Birol Mercan (Necmettin Erbakan University, Turkey)

## Abstract

In recent years, human capital, R&D activities and innovation have an important place in both empirical studies related with economic growth and new growth models. In this context, it is drawn that innovations frequently arising from R&D activities are the main engine of the new economy, while productivity-based positive relationship between human capital and economic growth of the countries is emphasized by a variety of evidence. This paper empirically investigates the impact of human capital, R&D and innovation on economic growth in context of G8 countries. Indicators used in analyze covering the period 1998-2012 are gross domestic product per capita, public spending on education, population with tertiary education between aged 25-64, total public and private sector R&D expenditures and international patent grants. Such relationships were analyzed by using the panel data method for the 8 cross-sectional units and 15 year long period. The results indicate that impact of both human capital and innovation on economic growth is signifanctly positive. Furthermore, results show that the total public and private sector R&D expenditure has a negative effect on economic growth while its coefficient statistically insignificant. Latter result obtained from analyze also contribute to discussions about the roles of patents and public funding or public performed R&D in economic growth.

## 1 Introduction

In recent years, human capital, R&D activities and innovation have an important place in various empirical studies (Teixeira and Fortuna, 2004; Canton, et. al, 2005; Batabyal and Nijkamp, 2013; Akinwale, et. al, 2012; Vogel, 2012; Jean, 2012; Cinnirella and Streb, 2013) conducted in both regional and national levels related with economic growth. In this studies, it is mostly drawn that innovations frequently arising from R&D activities is the main engine of the new economy while productivity-based positive relationship between human capital and economic growth of the countries is emphasized. However, new growth models with endogenous human capital, R&D, and innovation (Romer, 1986; Lucas, 1988; Aghion and Howitt, 1992) have underlined the vital role of these inputs in enhancing the economic growth.

According to recent contributions to growth literature, economists have argued that long run economic growth of nations is determined by economic behaviors such as R&D intensity, innovations, and human actions such as educational attainment (Canton, et. al, 2005: 1). Among them, human actions, in other words human capital, might affect the growth in two ways. First, human capital can enhance total factor productivity directly as skilled labor. Second, human capital might induce technological activities of firms by innovations, imitations or adoption of new technologies (Romer, 1990; Benhabib and Spiegel, 1994; Teixeira and Fortuna, 2004; Cinnirella and Streb, 2013). Furthermore, in their Schumpeterian endogenous growth model Aghion and Howitt (1992) showed that R&D activities can lead innovations which give firms a monopoly power by patent law and thus economic growth can be determined by technological innovations in a Schumpeterian creative destruction process.

The function of innovation in growth is to spread novelties in economic environment. If somewhat, the flow of innovation is interrupted, the long term growth rate of the economy will be low or it will be entered into a steady state where there is no growth. Thus, innovations is vital for long term economic growth (Fagerberg, 2005: 19-20). The sources of innovation may be either internal or external to the firm. Innovations can either be embodied in capital goods and products or disembodied such as patents, licences, design or R&D activities (Archibugi and Pianta, 1996: 451). In most of empirical studies innovation performance has been approximated by two proxies: the number of patent applications and patent grants (OECD, 1994; Archibugi and Pianta, 1996; Brenner and Broekel, 2011; Slaper, et. al, 2011; Hollanders and Tarantola, 2011). A patent can improve efficiency of the economy by means of providing the incentive for firms to engage in research, fostering innovation, hence growth and value creation. However, a central dilemma created by patents: they might interrupt static efficiency of the growth by reducing competition (in a state of monopoly) and thus higher prices (OECD, 2009: 22; Vogel, 2012: 5). Also, in context of supporting innovation, there is some controversy among economists about R&D activities performed by public sector and public funds to these activities (Klette, et. al, 2000; Martin and Scott, 2000).

This paper empirically investigates the impact of human capital, R&D and innovation on economic growth in context of G8 countries. Indicators used in analyze covering the period 1998-2012 related to economic growth, human capital, R&D and innovation are gross domestic product per capita, public spending on education, population with tertiary education between aged 25-64, total public and private sector R&D expenditures and international patent grants respectively. Section two focuses on the literature review about empirical studies,

while methodology and definitions are discussed in section three. Section four presents results of the data analysis and the last section concludes the paper.

## 2    Literature Review

In recent literature conducted by economists and researchers, there is much concern about new sources of economic growth. The majority of this literature investigates the effects of human capital, R&D activities by public and private sectors, and innovation in explaining changes in total factor productivity, and thus economic growth.

Barro (1991) examined 98 countries for the period 1960-1985. In his study, results showed that the growth rate of real per capita GDP is positively related to initial human capital (proxied by 1960 school- enrollment rates) and negatively related to the initial (1960) level of real per capita GDP. In their cross-country empirical study which covers 78 countries and the period 1960-1985, Benhabib and Spiegel (1994) indicated that human capital affects growth through two mechanisms. Accordingly, human capital levels directly influence both the rate of domestically produced technological innovation, and the speed of adoption of technology from abroad. Furthermore, Bassanini and Scarpetta (2001) and Krueger and Lindahl (2001) investigate the relationship between education level, human capital and economic growth in their cross-country studies. Both of the results showed that the changes in education and human capital accumulation positively affect economic growth.

Griffith, et. al, (2001) explored the roles of R&D activities and human capital in total factor productivity growth. In the analysis of their sample which consists of a panel of twelve OECD countries over the period 1974-1990, it is found that R&D and human capital play an important role in productivity growth and countries' catch up process as well as stimulating innovation directly. Another study conducted by Bilbao-Osorio and Rodríguez-Pose (2004) concentrated on selected NUTS1 and NUTS2 regions in the European Union. The results of the study emphasized the complex relationship between R&D investment, innovation, and economic growth.

Akinwale, et. al, (2012) focused the impact of R&D and innovation, labor and capital on economic growth in Nigeria. The results of the study using gross fixed capital formation, labor force and gross expenditure on R&D (GERD) and innovation showed that GERD plays a significant role on economic growth but an inverse coefficient is also observed between them. Researchers implied that low increase in R&D spending and innovation might refer weak institutions, high corruption practices, low interaction between the academia and the industry, poor coordination system, among others in the country. Also it is shown that labor has significantly positive impact on economic growth.

Vogel (2012) examined the effects of R&D and human capital on total factor productivity growth in the manufacturing sector across 159 regions of the EU-15 from 1992 to 2005. His empirical results provide significant evidence of a positive direct effect of human capital and a positive indirect effect of R&D activity on total factor productivity growth for the EU-15 regions. Another study was conducted by Jean (2012) to test the impact of R&D and human capital on regional growth in France. The analysis indicates that labor productivity in the French regions is influenced by physical capital, human capital and the intensity in the employment of professionals specialized in R&D. Moreover, differences in the public and private sources of research funding didn't seem to cause significant differences in the long term growth.

Teixeira and Fortuna (2004) estimated a long run relationship between total factor productivity, human capital stock, internal innovation capability (internal stock of knowledge – measured by the real accumulated expenditures on firms R&D), and absorption capability within Portuguese. Their results showed that human capital stock is more important than internal innovation capability to explain the Portuguese productivity for the period 1960-1991. Also, human capital and internal innovation capability directly affect Portuguese economy by means of productivity growth and its relation with innovation efforts.

## 3    Method and Dataset

For the analysis of the relationship between economic growth and human capital, R&D and innovations, a panel data set covering eight countries (U.S., Japan, Germany, England, France, Italy, Canada and Russia) and the period 1998-2012 is conducted. A panel data set contains repeated observations over the same units collected over number of periods. Although panel data are typically collected at the micro-economic level, it has become more and more practice to pool individual time series of a number of countries or industries and analyze them simultaneously (Verbeek, 2004: 341). Thus, while the studies based on cross-sectional data present only differences between same units, studies using panel data can show changes in both cross-section and time units (Baltagi, 2001: 7).

It can be said that there are two types of model to estimate with panel data: fixed effects model and random effects model. The general equation for the fixed effects model is given below:

$$y_{it} = \alpha_i + \beta_1 X_{it} + u_{it} \quad (1)$$

In equation (1), where $y_{it}$ is the dependent variable for each i=entity and t=time, $X_{it}$ represents one independent variable and $\beta_1$ is the coefficient for $\beta_1$, $\alpha_i$ (i=1…n) is the unknown intercept for each entity and $u_{it}$ is the error term. In a fixed effects model, if the unobserved variable does not change over time, then any changes in the dependent variable must be due to influences other than these fixed characteristics (Stock and Watson, 2007: 289-290).

The random effects approach assumes that the intercepts of the individuals are different but that they can be treated as drawings from a distribution with mean μ and variance $\sigma^2_\alpha$. The essential assumption here is that these drawings are independent of the explanatory variables in $X_{it}$. This leads to the random effects model, where the individual effects $\alpha_i$ are treated as random. The error term in this model consists of two components: a time-invariant component $\alpha_i$ and a remainder component $u_{it}$ that is uncorrelated over time (Verbeek, 2004: 343). It can be written as:

$$y_{it} = \mu + \beta_1 X_{it} + \alpha_i + u_{it} \quad (2)$$

The analysis uses the various databases provided by World Bank, European Statistics Office, OECD, UNESCO, WIPO and national statistical offices. The selection of variables used in model is based on indicators which are frequently encountered in the literature. Accordingly, the selected variables as measurements of economic growth, human capital, R&D and innovation are gross domestic product per capita, public spendings on education, population with tertiary education between aged 25-64, total public and private sectors R&D expenditures and international patent grants respectively. Definitions related to the variables are listed below:

| Variable / Indicator | Label | Data Source |
|---|---|---|
| Gross domestic product per capita (Current prices/ US Dollars) | GDP | - World Bank (World Development Indicators) |
| Total public spending on education (% of GDP) | EDS | - European Statistics Office (Eurostat) |
| Population with tertiary education (between aged 25-64, % of total population) | HUM | - Organization for Economic Co-operation and Development (OECD Statistics) |
| Total research and development expenditure by public and private sectors (current and capital expenditures/ % of GDP) | RDE | - United Nations Educational, Scientific and Cultural Organization (UNESCO) |
| Direct and The Patent Cooperation Treaty (PCT) patent grants (total) | PAT | - World Intellectual Property Organization (WIPO) - National statistical offices |

*Table 1. Selected Variables, Definitions and Data Sources*

Analysis using larger population of individual units, and a random effects framework seems appropriate, the fixed effects estimator may be preferred. The reason for this is that it may be the case that $\alpha_i$ and $x_{it}$ are correlated, in which case the random effects approach, ignoring this correlation, leads to inconsistent estimators. The problem of correlation between the individual effects $\alpha_i$ and the explanatory variables in $x_{it}$ can be handled by using the fixed effects approach, which essentially eliminates the $\alpha_i$ from the model, and thus eliminates any problems that they may cause. Hausman test suggests a test for the null hypothesis that $x_{it}$ and $\alpha_i$ are uncorrelated. The general idea of a Hausman test is that two estimators are compared: one which is consistent under both the null and alternative hypothesis and one which is consistent under the null hypothesis only (Verbeek, 2004: 351-352).

| Test Cross-Section Random Effects | | | |
|---|---|---|---|
| Test Summary | Chi-Sq. Statistics | Chi-Sq. d.f. | Prob. |
| Cross-Section Random | 28.004 | 4 | 0.000 |

*Table 2. Correlated Random Effects - Hausman Test*

When we computed Hausman test (Table.2), the test statistic [Chi-square (4): 28.004, p: 0.00], concluded that null hypothesis (error terms are not correlated with the explanatory variables) is rejected at 1% significance level. Thus the fixed effects model was preferred in analysis. Also, in analysis we used a logaritmic specification, except variables expressed as percentage. This specification might enable an easier interpretation of estimation and a less sensitivity to outliers. Such equation takes shape the following form:

$$\ln GDP = \alpha_i + \beta_1 \ln EDS_{it} + \beta_2 \ln HUM_{it} + \beta_3 \ln RDE_{it} + \beta_4 PAT_{it} + u_{it}$$

## 4   Findings

The results from the fixed effects model estimation indicate that approximately 90% of the changes in economic growth can be attributed to EDS, HUM, RDE, and PAT. Also, F-statistic (p value:0.000), show that at least some of the independent variables explain economic growth at 5% level of significance. When we look at coefficients of variables, it is observed that EDS, HUM, and PAT each have significantly (at 1% level of signifance) positive signs while coefficient of RDE is insignificantly negative. This implies that 1% increase in EDS leads to a %2.4 increase in GDP. This case means that G8 economies grow faster by means of increasing education spending within the framework of investment in human capital. Also it is shown that stock of human capital in developed countries plays an important role in economic activities. Hereby, estimation results show that a 1% increase in HUM leads to approximately a %1.25 increase in GDP. When we look at effect of PAT as a commercial output of innovation, it is seen that patents have a significant impact on economic growth. This result also refers that a well organized patent system in national and international context stimulate the economic activities by the way of supporting and rewarding inventors as well as promoting human resources.

***Table 3**. Results of Fixed Effects Model Estimation*

The p-value of RDE is 0.175, which represent that R&D expenditure as a sum of public and private sector expenditures statistically do not have a significant impact on growth while its coefficient is negative. As stated by Klette, et. al (2000) and Bilbao-Osorio and Rodríguez-Pose (2004), this might be a result of governments' design of support mechanism or differences arising from orientation and application of basic research. In this context, the basic research performed by public and higher education, in fact, tends to be less applied and have a low effect on patenting activities. Besides, privately funded research is frequently more effective and tends to have a high commercial returns. Also it can be argued that supported research projects by public funds might cause relatively low productivity levels and inadequate returns to economy (Klette, et. al, 2000; Bilbao-Osorio and Rodríguez-Pose, 2004).

## 5   Conclusion

In this study, roles of human capital, R&D, and innovation in economic growth have been investigated across G8 countries, over the 1998-2012 period. We used data of population with tertiary education between aged 25-64 and total public spending on education as a proxy of human capital. Moreover, as the measurements of R&D and innovation, we used data for total research and development expenditure by public and private sectors and direct and PCT patent grants respectively. The relationship between the independent variables and economic growth was analyzed using panel data method which enables to pool individual time series of a number of countries or industries and to analyze them simultaneously.

The results from analysis partially confirm previous studies which explored effects of human capital, R&D, and innovation on economic growth individually or together. Accordingly, the results point to a poisitive and significant effect of human capital and innovation to growth of gross domestic product per capita. Conversely, findings show that the total public and private sector R&D expenditure has insignificantly negative impact on

economic growth. Possible reasons of this result is that publicly performed R&D activities might base on basic research and might have some difficulties arising from commercialization process of inventions. The latter is might be related to lower returns to economy within public funding to private sector. In line with this result, one might also willing to investigate same country group whether it would be more appropriate to separate R&D expenditures as public sector and private sector.

# Beta Convergence Analysis on Transition Economies: 1991-2011

Asst. Prof. Dr. Ş. Mustafa Ersungur (Atatürk University, Turkey)

Ph.D. Candidate Aslı Cansın Doker (Erzincan University, Turkey)

Ph.D. Candidate Adem Türkmen (Erzincan University, Turkey)

## Abstract

Owing to Solow's neo-classical the convergence hypothesis, which explains underdeveloped and developing countries grew faster than any of these developed countries have acknowledged that captures the level of per capita income, was added to the economic growth and development literature. Despite, theoretically there are two different approaches in convergence analysis; real and conditional, it cannot be said generalizing empirical results for both. Accordingly, 29 transition economies which tried to cross from the planned economic system into liberal economic system, is subjected to this study. Convergence have been analysed on transition economies between 1991 and 2011 using the growth rate of per capita income as variables by cross-sectional data analysis. In this study, additionally to real convergence, obtaining from the KOF index of economics, political and social integration and openness data were included the model as dummy variables for examining conditional convergence. Depending on empirical results on real and conditional convergence analysis, the convergence hypothesis is accepted. It is identified that Cambodia, Vietnam and China especially have caught up with faster growth comparing with other transition economies; however, those countries have shown weaker convergence than others. On the other hand, Kirghizstan and Tajikistan, which are known as mostly having the effects of transition recessions, have negative growth rates, and those countries have been diverging from other countries' growth performance. From findings obtained within conditional convergence, it is examined while political liberalisation and openness variables have been accepted significantly; the economic and social liberalization variables have no significant effect on convergence.

## 1 Introduction

It is an undeniable fact that the world income distribution between countries is in the hands of a minority called high-income countries. While there are various types of the classification for high-income and high-trade-volume countries, in this study the terminology used will be "developed countries". Thanks to both the needs of current colonialism and the colonization movement in the historical process, nowadays developed countries hold a large part of world trade through multinational companies in their hands. In this context, in terms of economies of less developed and developing countries were wondering, a question comes to capturing the developed countries of this group will be sturdy? This problem can be characterized in the literature as the development gap. This is basically the difference between the per capita income levels of low-income countries and high-income countries (Kaynak, 2007). In the 1950s, considering opinion on the closure of the development gap, the convergence hypothesis was put forward by Solow (Solow, 1956). With the hypothesis of convergence, Solow explained that advanced economies of the stationary state after reaching the rate of growth will slow down, pointing out the level of savings and population growth rate of developed countries, which are the same in less developed countries, marginal efficiency of capital is high and thus high growth rates will occur, thus these developed countries will catch the convergence hypothesis with tried to explain. In the literature of economic convergence there are three approaches which rejected convergence hypothesis. Firstly, efficient and effective technology can make technology leader countries richer. The second view, there is convergence in real life, but you can only take place between the countries' own use of modern technology. The last approach, poor or underdeveloped countries have potential to grow in long term but the gap between developed countries and them never closes. While all three approaches draw a pessimistic picture for under developed and developing countries, Barro (1991), Baumol (1986), and Delong (1988) in their work, as an argument of the countries' initial income levels, the dependent variable in per capita income growth in the average is models, establishing convergence with cross-sectional data have identified. These studies will be discussed in detail in the literature. Another approach for convergence analysis is that per capita income and long-term forecasts to examine the relationship between the series is stationary is interested in the time series approach. Key elements of this approach can be written as stationary series can converge to their long term average or return their trend; however, non-stationary series can be affected by shocks and those shocks can place permanently effects on their trend. Barron's horizontal cross-sectional modeling has been applied in this study.

## 2 Literature Review

Economic convergence has been discussed in many studies and the researcher's aim with using this approach is to determine real or conditional economic convergence on chosen 26 transition economies. The main question among international economics related to the convergence literature is how growth rate or trade may well affect convergence between countries. Over the post war period the world has been becoming relatively integrated

through international trade. This integration has resulted to experience in their income per capita and also their purchasing power parity. The literature on economic convergence shows that international trade allows transferring knowledge, technology and also ideas to follower countries then this can press competitive market structure in follower countries. Competitive domestic market might well create positive pressure on production then speed of growth (Grossman et.al, 1991). Young (1991) stated another -pessimistic- approach for economic convergence in follower or poor countries is that with knowledge or ideas transfer can offer just little scope for growth or development in poor countries and he claims that little scope would become a trap for those. According to Krugman, owing to similarities on income levels, monopolistic competition and economies on scales can increase trade; moreover, spreading knowledge and technology transfers would be an indicator how the difference on income lowers between countries. Ban David (1993) shows that the timing of trade liberalisation identifies the relationship between income level and economic convergence. Helpman (1987) shows that learning process can create positive convergence on chosen 14 OECD countries with using bilateral trade data. Sahns and Warner(1995) claim that using dummy variables for determining social, politic and economic qualifications on economic convergence analysis gives more specific interpretations for countries and using as a term qualified and non-qualified classifications crate conditional converging countries groups. Dowrick Nguyen (1989) provided that initial rate of human capital signifies conditional economic convergence.

Critical body of convergence empirical studies on income convergence depends on another question which is countries converge to themselves on steady states despite their initial variables are less than differences in domestic steady state position (Durlauf et.al.,2005). Balwin et.al. (2003) shows that different stage of international trade liberalisation could make different convergence or divergence path through changing cross section. Barro (1991) states that political and economic openness are significant determinants for analysing economic convergence. Alesina et.al. (1992) indicates that some political phenomenon may strengthen the analysis which are economic and politic instability and democracy as a factor. Williamson (1993) argued that integration on global economy has existed since 1850 and he added that using grouping time series with two sub period has proved one convergence on restricted global trade between two world wars.

The convergence methodological literature provides a great number of approaches. In this part using this literature, features of convergence and techniques of convergence will be discussed respectively. There are two types of convergence which are Beta and Sigma convergence. Convergence analysis of the theoretical literature is quite broad methodological in outside of international economics. In this part, the features and techniques of convergence will be discussed. It is possible to divide convergence in two cases which are beta and sigma convergence respectively (Loewy, 1996). Baumol (1986) defined beta convergence among countries such that there is a negative correlation between the growth rates are described with using initial GDP and average growth rate (Hence we can speak of a beta convergence parameters for the start of the year must be less than zero. Sigma convergence, which is the second type of convergence, the standard distribution of income is continuously decreasing and sigma analysis subgroup analysis also means that regional (Zeren, 2011). For Sigma convergence, having Beta convergence for convergence but insufficient condition should be, not vice versa. Beta convergence is divided in itself is the first real convergence of the second conditional. Expected results from the convergence analysis of both types of beta parameter are negative and significant (Li et.al., 1999). So far, the studies that examined the horizontal section contain the results obtained with different techniques, but some of convergence can be mentioned in the literature gives them the ADF panel, ARDL and fuzzy model. Shibata et al. (2004) study of 64 African, Asian and Latin American countries made using panel data analysis of the sigma income convergence with trade liberalization have been detected. In the same study except African countries' groups has identified a beta convergence. Another important study, the Penn World data obtained using fuzzy modeling have been made to 88 countries. With this modeling is a positive relationship between openness and income has been identified (Stroomer et.al., 2003). Globalization is discussed in the context of the importance of technology diffusion, a relatively large openness in developing countries; the impact of globalization affects the speed of growth (Lutz, 2001).

## 3   Data Set and Empirical Results

In this study, GDP and average growth rate between 1991 and 2011 for chosen 29 transition economies has been determined as data determinants to analyze (Table 1). Barro and Sala-i Martin (1991) found a notation for conditional convergence with using chosen countries data sets which were initial per capita income levels and their long run per capita income levels to analyse rapid of growth convergence. In convergence analysis, with in formal notations, it is assumed that country i have long run income per capita $y_i^*$ and determined initial income level $y_i$. The rate of growth can be calculated from difference between $y_i^*$ and $y_i$ this can be written such that;

$$\dot{y} = \beta(y_i^* - y_i) \tag{1}$$

The data used in the analysis from the Penn World Table 7.1 and 8.For the real convergence analysis; there are some calculations for the variables which are explained below in Table 2.

| Countries | 1991 initial GDP | 1991-2011 avarege growth rate |
|---|---|---|
| Albania | 2736.88 | 3.43 |
| Armenia | 4489.21 | 2.50 |
| Azerbaijan | 13436.19 | 2.48 |
| Belarus | 11083.66 | 2.28 |
| Bulgaria | 8802.31 | 2.73 |
| Cambodia | 789.90 | 5.89 |
| China | 2102.63 | 6.98 |
| Croatia | 10283.48 | 1.26 |
| Czech Republic | 15856.11 | 0.66 |
| Estonia | 11751.40 | 2.49 |
| Georgia | 7787.73 | 0.26 |
| Hungary | 10211.32 | 1.84 |
| Kazakhstan | 11306.98 | 1.01 |
| Kyrgyzstan | 6573.63 | -3.84 |
| Laos | 1232.25 | 3.67 |
| Latvia | 10824.93 | 1.23 |
| Lithuania | 9121.82 | 1.06 |
| Macedonia | 4911.82 | 2.65 |
| Moldova | 4119.68 | 0.27 |
| Poland | 6748.90 | 4.70 |
| Romania | 5627.61 | 3.75 |
| Russia | 20057.46 | -0.06 |
| Slovak Republic | 11328.07 | 1.65 |
| Slovenia | 15223.16 | 1.29 |
| Tajikistan | 5726.83 | -1.08 |
| Turkmenistan | 8892.03 | 1.58 |
| Ukraine | 8626.65 | 0.02 |
| Uzbekistan | 4130.79 | 2.21 |
| Vietnam | 1199.65 | 6.02 |

*Table 1: Data Set (Penn World Table 7.1 and 8)*

| Rgdpo | Output-side real GDP at chained PPPs (in mil. 2005US$) |
|---|---|
| Pop | Population (in millions) |

*Table 2: The calculation methods of the data*

In our model, Barron 's production is used instead of per capita national income calculated according to the total value of the real data obtained by dividing the population are used. Instead of real national income per capita spending power analysis will provide more accurate results to be obtained is preferred (Sach et.al., 1998).

Real convergence model is determined such that;

$$average\ growth\ rate = \beta_0 + \beta_1 GDP_{initial\ year} \tag{2}$$

In this study GDP for initial year which is 1991 and average growth rate in GDP per capita between 1991 and 2011 were used for modeling beta convergence analysis. The expectation from convergence analysis in econometric theory is suggested that having negative value of β1 signify beta convergence. Moreover, the value of it can be interpreted the rapid of convergence. As a result of analysis for achieving the convergence hypothesis is that the negative value of expected cases but in this case $\beta_1$ convergence can be mentioned. Analysis results are shown below (Table 3).

| Variables | coefficients | t-Statistic | Prob. |
|---|---|---|---|
| C | 3.828126 | 5.191535 | 0.0000 |
| GDPPC1991 | -0.000222 | -2.808778 | 0.0091 |

*Table 3: The results of real convergence analysis*

Real convergence model with theoretical expectations hypothesis of the beta coefficient is less than zero at the 0.01 significance level adopted and the existence of real convergence could be mentioned. Additionally, the rapid of convergence is 0.00022 which may well explain slow convergence for chosen countries.

### 3.1 Conditinal Convergence Analysis

The difference between conditional and real convergence analysis is usage of control variables in models. In this study, dummy variables out of the control variables determining the analysis has been made more specific. Each dummy variable is conditional constraint for chosen sample. Those dummy variables for 2013 data from the KOF index of political, social, economic globalization has benefited from the calculations in Table 4.

| Variables | Content Of Data | Mean |
|---|---|---|
| d_eco | Dummy for economic globalization: The KOF index was classified the degree of economic globalization with using actual flows and restrictions on trade and capital. | 48.57 |
| d_soc | Dummy for social globalization : The KOF index was classified social globalization with using three dimensions which are informational flows, personal contacts and cultural proximity | 52.22 |
| d_op | Dummy for openness: Penn Word Table 7.1 calculated opennes with Openness at Current Prices (%) the Openness Index is the higher the index the larger the influence of trade on domestic activities. | 92.907 |
| d_over | Dummy for overall globalization: it can be written as calutation of overall political, economic and social globalization. | 51.131 |
| d_pol | Dummy for politic globalization: The KOF index was used political globalization to proxy the degree of political globalization which includes the number of embassies in the country and the number of membership on international organizations. | 56.704 |

*Table 4: The content detail of dummy variables*

It also gives an opening for the other control variables which has benefited from the Penn World Table 8. This calculation method of the data sets is located in Appendix 1. Index of data between 1991 and 2011 were averaged and this average remaining countries under the "0" to countries with above average value of "1" is given. Dummy variables, the values in Table 5 are included in detail.

| Countries | d eco mean=48.57 | d soc mean=52.22 | d pol mean=56.704 | d genel mean=53.131 | dop mean=92.907 |
|---|---|---|---|---|---|
| Albania | 0 | 0 | 1 | 0 | 0 |
| Armenia | 1 | 0 | 0 | 0 | 0 |
| Azerbaijan | 0 | 0 | 0 | 0 | 1 |
| Belarus | 0 | 1 | 0 | 0 | 0 |
| Bulgaria | 1 | 1 | 1 | 1 | 1 |
| Cambodia | 1 | 0 | 0 | 0 | 0 |
| China | 0 | 0 | 1 | 0 | 0 |
| Croatia | 1 | 1 | 1 | 1 | 0 |
| Czech Republic | 1 | 1 | 1 | 1 | 0 |
| Estonia | 1 | 1 | 1 | 1 | 0 |
| Georgia | 1 | 0 | 0 | 0 | 1 |
| Hungary | 1 | 1 | 1 | 1 | 1 |
| Kazakhstan | 1 | 0 | 0 | 0 | 1 |
| Kyrgyzstan | 0 | 0 | 0 | 0 | 1 |
| Laos | 0 | 0 | 0 | 0 | 1 |
| Latvia | 1 | 1 | 0 | 1 | 1 |
| Litvanya | 1 | 1 | 1 | 1 | 1 |
| Macedonia | 0 | 1 | 0 | 0 | 0 |
| Moldova | 1 | 1 | 0 | 0 | 1 |
| Poland | 1 | 1 | 1 | 1 | 0 |
| Romania | 0 | 1 | 1 | 1 | 1 |
| Russia | 0 | 1 | 1 | 1 | 0 |
| Slovak Republic | 1 | 1 | 1 | 1 | 1 |
| Slovenia | 1 | 1 | 1 | 1 | 1 |
| Tajikistan | 0 | 0 | 0 | 0 | 1 |
| Turkmenistan | 0 | 0 | 0 | 0 | 1 |
| Ukraine | 0 | 1 | 1 | 1 | 1 |
| Uzbekistan | 0 | 0 | 0 | 0 | 1 |
| Vietnam | 0 | 0 | 0 | 0 | 1 |

*Table 5: Dummy variables data set*

The conditinal beta convergence is modelled such that;

$$y_t = \beta_0 + \beta_1 GDP_{initial\ year} + \beta_2 Deco + \beta_3 Dsoc + \beta_4 Dgen + \beta_5 Dopen + \beta_5 Dpol \qquad (3)$$

Results of the analysis are located below for 29 transition economies (Table 6).

| Variable | Coefficient | t-Statistic | Prob. |
|----------|-------------|-------------|-------|
| C | 4.794765 | 4.173474 | 0.0004 |
| GDPPC1991 | -0.00027 | -2.84112 | 0.0095 |
| D_ECO | 0.023396 | 0.028218 | 0.9777 |
| D_POL | 0.741761 | 0.535577 | 0.5976 |
| D_SOC | -0.73185 | -0.56333 | 0.5789 |
| D_OVER | 0.942263 | 0.453261 | 0.6548 |
| D_OP | -1.50214 | -1.78215 | 0.0885 |

*Table 6: Results of conditional Beta convergence analysis*

It can be said from above the exclusion of intercept dummy for openness, all dummies can rejected at 0.10 per cent. We also analyse all dummies one by one in this model after this, politic globalization and openness dummies are significant at 0.10 per cent (Table 7).

| Variable | Coefficient | t-Statistic | Prob. |
|----------|-------------|-------------|-------|

| 6 | Cambodia | 14 | Kyrgyzstan | 22 | Russia | | |
| 7 | China | 15 | Laos | 23 | Slovak Republic | | |
| 8 | Croatia | 16 | Latvia | 24 | Slovenia | | |

*Table 9: Convergence scatter graph and countries codes*

According to this model at a significance level, political liberalization has taken place in the model significantly at the 0.05 level. Also for openness in other models in the model is significant at the 0.05 level of significance openings are located (Table 8).

Conditional convergence and real convergence analysis is significant, then scatter chart of the convergence of the country is seen more clearly (Table 8).

As seen in the graph Cambodia, Vietnam and China starting as low income countries, in the model because it requires the convergence of transition economies grew faster than in the general therefore have a divergent outlook. Kyrgyzstan and Tajikistan, the period referred to as having a negative growth rate as an average performance of other countries have turned away from convergence. Convergence performance of the countries on the chart shows a fairly regular distribution. Additionally, slope dummies are applied in conditional convergence analysis; however, none of dummies are significant at 0.10 levels.

## 4 Conclusion

In this study, real convergence and conditional convergence approach is applied on 29 transitional economies between 1991 and 2011 with using the average growth rate and the initial year 1991, which are provided from the income per capita, value of production calculation method of purchasing power parity. Analysis results showed that the chosen 29 transitional economies may well be mentioned for the real beta convergence. Additionally, dummy variables, which presented social, political and economic globalization and openness level for chosen countries, are statistically significant at the 0.10 level. The aim of using KOF index for conditional convergence is to see clearly the effects of political differences on convergence. It can be said that transitional economies not only have been converging to their average slowly and also political and social regulations effect the convergence. It can be seen from scatter chart of convergence that low income countries draw divergence trend during the period. Another important result is that European Union members which are Romania, Bulgaria, and Poland have remarkable positions with the convergence of growth rates. It is a crucial result for Tajikistan and Kyrgyzstan to have divergence with negative average growth rates. Moreover Cambodia, Vietnam and China show convergence, but in relatively high growth performances during the time period. For conditional convergence, only the political integration and openness variable was significant for Albania, Bulgaria, China , Croatia, Czech Republic, Estonia, Hungary, Lithuania, Poland, Romania, Russia, Slovakia, Slovenia, Ukraine. With having negative coefficient, political globalization dummy has negative pressure to convergence's speed or trend. On the other hand, with having positive coefficient, openness dummy has a positive impact on convergence. International economics theory expectations of transitional economies allow those results additionally for openness. As a result of this, it can be said that planned economic liberalization on the economies in transition might well result to convergence between countries supported by the results. Furthermore, it can be concluded that Tajikistan and Kyrgyzstan have negative values of the average growth rate within this aspect, it can be concluded that in the socialist economic system of production planning and in the liberalization process of adaptation caused to face serious economic crisis in those countries. Another remarkable point from this study, in Central Asia after the liberalization process experienced many political disputes adversely this affects growth in this area. This can be related with those economies grew faster than in the general therefore have a divergent outlook. It is clear that Middle Asian transition economies have some political critical issues; because of that, Kyrgyzstan and Tajikistan have turned away from convergence with negative growth rates. From the econometric analysis, convergence parameter, which expresses speed of convergence, is -0,00023 in other words, the speed of convergence is very low for chosen countries. In summary, there have been two weighted explanations from literature revision for slow convergence in transition economies. First of all, holding technological advantage for a country-especially transition economies in this case- helps to grow faster and richer because this can give them a technological leader position in their classification group. Secondly, economic growth and relatively convergence requires plausible regulations and institutions so transition economies need time to adapt and integrate those. From the findings it can be interpreted such that political institutions and regulations give an advantage for countries to converge. It is recommended that using dependent dummy variables to analyse political and social regulations effects on slope of convergence.

# Factors Impacting Capital Structure in Indonesian Food and Beverage Companies

Prof. Dr. Euphrasia Susy Suhendra (Gunadarma University, Indonesia)

## Abstract

Capital structure is directly related with the financial decision of the company. Capital structure theories seek to explain why businesses choose different mixes of debt and equity to finance their operations. The concept is generally described as the combination of debt & equity that make the total capital of firms. It usually comprises all the sources of finance that a company is utilizing to finance its operations. The aim of this study is to know the major determinants of capital structure, the factors that affect capital structure. This study has used the data from 17 food and beverages Indonesian firms over a time period of 3 years (20010-2012). Debt to equity ratio (DER) is a dependent variable which is defined as the ratio of total debt to equity of the observed company, and there are five independent variables, which are liquidity, profitability, asset tangibility, firm size, and firm growth. As a result of this study, there are two variables that have a significant effect toward Capital Structure in sector of Food and Beverages Companies; they are Liquidity and Asset Structure with significant negative correlation. The other three remaining independent variables which are Profitability, Firm Size, and Asset Growth do not have significant effect toward the Capital Structure in sector of Food and Beverages Company.

## 1   Introduction

The term "capital structure" of a company is actually a combination of equity shares, preference shares and long-term debts. A cautious attention has to be paid as far as the optimum capital structure is concerned. With unplanned capital structure, companies may fail to economize the use of their funds. Consequently, it is being increasingly realized that a company should plan its capital structure to maximize the use of funds and to be able to adapt more easily to the changing conditions. (A. Hovakimian, T. Opler, and S. Titman, 2009)

Capital structure is directly related with the financial decision of the company. Capital structure theories seek to explain why businesses choose different mixes of debt and equity to finance their operations. The concept is generally described as the combination of debt & equity that make the total capital of firms. It usually comprises all the sources of finance that a company is utilizing to finance its operations. Usually, capital structure is made up of ordinary share capital, preference share capital, and debt capital amongst others. It shows how a company finances its overall operations and growth by using different sources of funding. Capital structure of companies varies with its size, type and some other characteristics such as age of the company, company size, asset structure, profitability, company growth, company risk and liquidity (Al-Najjar and Taylor, 2008). Specifically, the influential factors in determining how firms select the types of security to be issued are considered to be questionable.

One of the most important decisions faced by financial managers in relation to the continuity of the company's operations or financial decision-making is capital structure, which is a financial decision relating to the composition of the debt with equity elements that should be used by company. Manager should be able to raise funds, either sourced from within the company or outside the company efficiently.

The purpose of managing capital structure is to mix the financial sources in order to maximize the wealth of shareholders and minimize the company's cost of capital. Therefore, one of the financial manager's responsibilities is to manage and decide the optimal capital structure for the purposes. His or her decision on capital structure could be critical because it may affect the company values and it involves a trade-off between risk and return. A rise in debt will increase the company's risk and the expected return. High risk means an increase in debt which could lead to a decrease in stock price and an increase in the expected return of stock price (Brigham and Houston, 2001). Hence, the motivation of an optimal capital structure is to ensure the balance between risk and return in order to maximize the stock price (Brigham and Houston, 2001).

The food and beverages sub-sector industry has an important role in Indonesia's economic growth. Minister of Industrial of Republic of Indonesia stated that the food and beverages sub-sector industry plays an important role in industry development, especially in the contribution of gross domestic product (GDP) of Non-Oil & Gas Industry in Indonesia.

The reason of choosing food and beverages sector industry is because food and beverages stock is the most resistant stock among the other sectors when faced with the economic crisis. Food and beverages products are still needed in every condition, whether it is in a crisis condition or not. This company's product is often highly used and consumed, and is able to stand in every capital structure policy that company has made. Thus, even how bad the capital structure decision within company can be, it is almost to be ensured that the products will still have consumers buying for it, the products therefore are needed very much by consumer. If the production activities are hampered it will interfere other company activities that will cause losses. Company therefore must

strengthen the internal factors in order to keep growing and sustain, one of the way is managing and maintaining the capital structure properly to maximize the wealth of the firm, more specifically shareholder's wealth maximization. To maximize firm's value as well as minimize the cost of fund, a manager should set up an optimal capital structure.

Capital structure on food and Beverages Company encounters instability, thus in financing the business, inappropriate capital structure does not result in an ideal composition of capital structure. The problem in determining capital structure decision is how to mix between debt and equity in the company's capital structure that will influence its market value. Food and beverages companies have a high composition of capital structure (DER), characterized by a high level of total debt to total equity.

According to the problems that have been formulated, then the purpose of this research are as follows, (1) To analyze the relationship of selected factor like profitability, liquidity, asset structure, firm size, and asset growth on capital structure (Total Debt to Equity Ratio) of foods and beverages company listed on Indonesian Stock Exchange; (2) To know which variable has the greatest influence on capital structure of food and beverages company

## 2   Literature Review

The term capital has several meanings and it is used in many business contexts. Capital is something owned which provides ongoing services. In general, capital is accumulated assets or ownership. More specifically, capital is the amount of cash and other assets owned by a business. These business assets include accounts receivable, equipment, and land/buildings of the business. Capital can also represent the accumulated wealth of a business, represented by its assets less liabilities. The definition of capital according to Brigham (2006:62) is "capital is the sum of long-term debt, preferred stock, and common stock equity, or maybe those posts plus short-term debt charged by interest."

Capital structure has been defined as the proportionate mix of debt and equity. Basically, the essential elements of capital structure are debt and equity. Keown et. al (2005) stated that debt is an amount owed to a person or organization for funds borrowed. Debt can be represented by a loan, bond, mortgage or other form stating repayment term. Meanwhile, equity is an ownership interest in a corporation, it could be a common stock or preferred stock. It also refers to total assets minus total liabilities, in another case it is shown as shareholder's equity.

Sartono (1999), financial structure is proportion between total liabilities and total equity that are shown on the balance sheet. Scott, Petty, Martin, and Keown whose writing piece was translated by Sulistyorini and Djakman (2000), financial structure is proportion between liabilities – equity that required as specification by company management. Gitman (1997), capital structure is the mix of the long-term debt and equity maintained by the firm.

According to Brigham & Ehrhardt (2008) capital structure refers to the firm mixture of debt and equity. Therefore, a value-maximizing firm will establish an optimal capital structure and then raise new capital to target this optimal capital structure over time (Brigham and Ehrhardt 2008) .According to Devic and Krstic (2001), Capital structure is expressed as ratio of long term liabilities to the sum of long term liabilities and firms' equity. Capital structure is described as long term debt divided by total assets (Omet, 2008; Delcoure, 2007). The origin and combining two types of capital determines to a considerable extent financial stability and strength to pay the company's long-term debt (RahnamaRoudposhti et al. 2006, p. 352).

The capital or ownership of a business can be evaluated by knowing how much of the ownership is in debt and how much in equity. The company's debt might include both short-term debt and long-term debt (such as mortgages), and equity, including common stock, preferred shares, and retained earnings. Capital structure is sometimes referred as a company's debt to equity ratio.

The information on capital structure is essential for every stakeholder of a firm to make their decisions pertaining to the firm. Suitable capital structure is not only imperative for maximization of interest of every stakeholder of an organization, but also crucial for the organization to compete effectively and efficiently in its operating environment (Simerly and Li, 1999). Capital structure decision is also affected by firm's characteristics. These characteristics are potentially contentious (Titman and Wessels 1988). Each theory of capital structure gives different implications on how the firm's characteristics influence the firm's capital structure choices.

Literature has stated that various external and internal factors affect the capital structure of corporate organizations. The external factors include factors such as tax policy, capital market conditions and tax policy, among others. Meanwhile, the internal factors are those which are related to individual firm characteristics. Capital structure theories have identified a wide range of internal factors which are potentially influential toward capital structure choice. Reference identified some of these internal factors to include which are firm size, profitability, assets tangibility, taxation, firm growth rate, and liquidity. However, many researchers found that

the factors affecting capital structure vary from one country to the other due to a variation in the level social, environmental, economical, technological and cultural development. As a result of this, findings from studies in one country cannot be reasonably generalized to other countries.

It has been theorized in the literature that firms may actually have more debt in their capital structure than is appropriate for two reasons. First, higher levels of debt align the interests of managers and shareholders (Harris and Raviv, 1991). Second, managers may underestimate the costs of bankruptcy, reorganization or liquidation (Gleason et al., 2000). Both of these factors suggest higher than appropriate amounts of debt in the capital structure.

## 3   Research Methodology

Population is the subject of research which has the least same properties. The population in this research is food and beverages companies listed on IDX period 2010-2012.          Samples can be interpreted as a part or representative population studied. The sampling technique that is used is Purposive Sampling. Purposive sampling is a technique to obtain and determine the sample with a certain consideration and specific criteria. Population of this research is food and beverages sector of manufacturing company listed in Indonesian Stock Exchange for period 2010-2012. A total of 19 food and beverages companies have been collected. Purposive sampling method is used to collect sample. This research used 17 samples of food and beverages companies of food and beverages sector, starting from 2010 until 2012.

Capital Structure has been uniquely taken as the dependent variable here. It indicates that the mix of equity financing and debt financing do support the assets side of the company's balance sheet. Debt to equity ratio (DER) is taken as a dependent variable which is defined as the ratio of total debt to equity of the observed company. This research uses five independent variables, which are liquidity, profitability, asset tangibility, firm size, and firm growth.

This model is chosen because the purpose of this research is to determine the independent variables which have the effects toward dependent variable. Simple regression model is used to analyze the relationship between two variables, independent variable (x) and dependent variable (y). The equation of multiple regression analysis is as follow:

**Y = X1 + X2 + X3 + X4 + X5 + e**

where:

Y = Capital structure (Leverage) of a firm as measured by the DER (Debt to Equity Ratio)
X1 = Profitability
X2 = Liqudity
X3 = Asset Structure (Tangibility)
X4 = Firm Size
X5 = Asset Growth
e   = error

## 4   Result and Discussion

The first analysis was done to analyze the data by using descriptive statistic which describes all variables of the research. Descriptive statistics result shows the minimum and maximum value of each variable and also the mean and standard deviation of the variables.

The variables of this research are liquidity, profitability, asset tangibility (asset structure), firm size, asset growth and capital structure as measured by DER. General description of these variables appears on table 4.1 below:

**Descriptive Statistics**

|  | N | Minimum | Maximum | Mean | Std. Deviation |
|---|---|---|---|---|---|
| Liquidity | 51 | ,58 | 6,33 | 1,9240 | 1,11918 |
| Profitability | 51 | ,02 | ,42 | ,1209 | ,09047 |
| Asset_Structure | 51 | ,13 | ,74 | ,3500 | ,14918 |
| Firm_Size | 51 | 25,41 | 31,71 | 28,1676 | 1,57639 |
| Asset_Growth | 51 | -,07 | ,91 | ,2474 | ,22982 |
| DER | 51 | ,19 | 2,49 | 1,0349 | ,57990 |
| Valid N (listwise) | 51 |  |  |  |  |

*Table 4.1* Descriptive Statistics.

Normality test is conducted with a statistical analysis which is a non-parametric One-Sample Kolmogorov-Smirnov (KS Test) in order to find out whether the residual value is normally distributed or not. The results of the analysis using histograms and normal probability graphs plot can be seen in Figure 4.2 and Figure 4.3 as follows:

*Figure 4.1* Histogram and normal probability

Histogram in Figure 4.2 shows that the data has a normal distribution pattern (indicated by a bell-shaped curve).

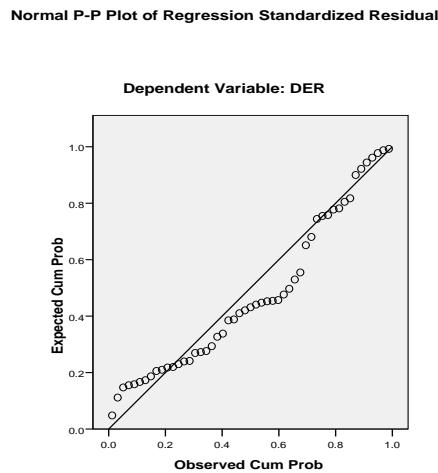

*Figure 4.2* Normal PP Plot of Regression Standardized Residual

The graph shows the normal probability plots coincide with the point spread around the diagonal line and follow the direction of the diagonal line. It means that it is normally distributed. Besides using analysis graph, normality test is conducted with a statistical analysis which is a non-parametric One-Sample Kolmogorov-Smirnov (KS Test) as follows:

**One-Sample Kolmogorov-Smirnov Test**

|  |  | Unstandardized Residual |
|---|---|---|
| N |  | 51 |
| Normal Parameters[a,b] | Mean | ,0000000 |
|  | Std. Deviation | ,47296602 |
| Most Extreme Differences | Absolute | ,153 |
|  | Positive | ,153 |
|  | Negative | -,095 |
| Kolmogorov-Smirnov Z |  | 1,094 |
| Asymp. Sig. (2-tailed) |  | ,182 |

a. Test distribution is Normal.

b. Calculated from data.

*Table 4.2.* Kolmogorov Smirnov Test

Based on table 4.2 above, it can be seen that when Asymp. Sig (2 - tailed) is greater than the criteria of significance (p-value) 0,05, this proves that the variable is normally distributed, where the test results are consistent with the analysis of histograms and normal probability graphs plot. It shows that all of the independent variables used are normally distributed.

Multicollinearity test is used to determine whether the regression model is found to have a correlation between independent variables. Multicollinearity test is done by calculating the variance inflation factor (VIF) of each independent. VIF values must be less than 10 and the tolerance value is more than 0,1. The value of VIF and tolerance value are available in Table 4.3 below:

**Coefficients<sup>a</sup>**

| Model | | Collinearity Statistics | |
|---|---|---|---|
| | | Tolerance | VIF |
| 1 | Liquidity | ,722 | 1,385 |
| | Profitability | ,897 | 1,115 |
| | Asset_Structure | ,671 | 1,490 |
| | Firm_Size | ,895 | 1,117 |
| | Asset_Growth | ,875 | 1,142 |

a. Dependent Variable: DER

*Table 4.3. Multicollenearity Test*

The table 4.3 shows all the variables do not have a problem with multicollinearity because the value of tolerance is more than 0,1 and the value of VIF is less than 10. It can be concluded that there is no multicollinearity in the regression model.

Autocorrelation test aim is to know whether a correlation between the residual in t period ant t-1 period. Autocorrelation test is done by calculating the value of the Durbin-Watson. The value of dW for five independent variables with 17 samples is 1.7701 and the dW is 2,115. The value of Durbin-Watson is shown in table 4.4 below:

| Model | R | R Square | Adjusted R Square | Std. Error of the Estimate | Durbin-Watson |
|---|---|---|---|---|---|
| 1 | ,579(a) | ,335 | ,261 | ,49855 | 2,115 |

a Predictors: (Constant), Asset Growth, Firm Size, Liquidity, Profitability, Asset Structure

b Dependent Variable: DER

*Table 4.4. Autocorrelation Test*

Table 4.4 shows the value of Durbin-Watson is 2,115. Since the value of Durbin-Watson is the region with no autocorrelation, which is located dU < dW < (4-dU). Thus, it means no autocorrelation.

Heterocedasticity test is used to determine whether or not the regression model has a constant variance from the residual one to another observation.

The aim of using multiple regression analysis is to know the influence of the independent variables affect dependent variables.

**Coefficients<sup>a</sup>**

| Model | | Unstandardized Coefficients | | Standardized Coefficients | | |
|---|---|---|---|---|---|---|
| | | B | Std. Error | Beta | t | Sig. |
| 1 | (Constant) | 2,686 | 1,435 | | 1,872 | ,068 |
| | Liquidity | -,331 | ,074 | -,638 | -4,462 | ,000 |
| | Profitability | ,775 | ,823 | ,121 | ,942 | ,351 |
| | Asset_Structure | -1,438 | ,577 | -,370 | -2,492 | ,016 |
| | Firm_Size | -,025 | ,047 | -,067 | -,520 | ,606 |
| | Asset_Growth | ,353 | ,328 | ,140 | 1,077 | ,287 |

a. Dependent Variable: DER

*Table 4.5. Multiple Regression T-Test Result*

After testing the influence of each independent variable towards the dependent variable, the following will present the influences of all independent variables on the dependent variable. The following table presents the calculation:

**ANOVA[b]**

| Model | | Sum of Squares | df | Mean Square | F | Sig. |
|---|---|---|---|---|---|---|
| 1 | Regression | 5,629 | 5 | 1,126 | 4,530 | ,002[a] |
| | Residual | 11,185 | 45 | ,249 | | |
| | Total | 16,814 | 50 | | | |

a. Predictors: (Constant), Asset_Growth, Firm_Size, Liquidity, Profitability, Asset_ Structure

b. Dependent Variable: DER

*Table 4.6. Multiple Regression F-Test Result*

The results of calculations using SPSS above show that the value of $F_{count}$ is 4,530. This value is greater than the value of F table for 2,422. Similarly, the probability of significance for the model formulated in this study is 0.002. This value is smaller than 0.05 so it can be concluded that the variables of liquidity, profitability, asset structure, firm size, asset growth simultaneously affect DER at a confidence level of 95% (α=5%).

To determine the amount of variation in the dependent variable can be determined from the value determination. The strength of influence between independent variable and dependent variable can be seen from coefficient of determination value ($R^2$) that is in range between 0-1. If the value is close to 1, thus it means that the independent variables almost give all of the information needed to predict the variation of dependent variable (Ghozali, 2005).

**Model Summary**

| Model | R | R Square | Adjusted R Square | Std. Error of the Estimate |
|---|---|---|---|---|
| 1 | ,579[a] | ,335 | ,261 | ,49855 |

a. Predictors: (Constant), Asset_Growth, Firm_Size, Liquidity, Profitability, Asset_Structure

*Table 4.7. Determination Test Result*

The coefficient of determination ($R^2$) of 0,335 implies that simultaneously 33,5% DER is influenced by liquidity, profitability, asset structure, firm size, asset growth, government ownership and public ownership. While 66,5% are influenced by other variables or other factors outside the model.

Capital structure is the financial decision of every firm. Every firm must decide the optimal proportion of debt and equity in order to have a maximum firm value. Usually, capital structure is measured by debt to total assets ratio, equity to total assets ratio, and debt-equity ratio. Appropriate (optimal) capital structure decisions would increase and maximize the market value of the share of a company. According to numerous researches, capital structure decisions are determined by a complex set of factors (Chen, 2004; Mazur, 2007; Bhabra, Liu & Tirtiroglu, 2008; Frank & Goyal, 2009; Getzmann, Lang & Spremann, 2010).

Capital structure can be explained by all of the independent variables. The explanation of each variable is

**Liquidity**

In this research, liquidity variable has a significant influence towards DER, whereas it can be concluded from the coefficient regression that liquidity has negative relation with capital structure. It means that lower asset liquidity reduces the costs of debt, and as a result, companies use more debt.

Myers and Rajan (1998) and Morellec (2001) argued that the effect of asset liquidity on leverage is positive only when managers have no discretion over firm assets, which reduces the risk of wealth expropriation (e.g., assets serve as collateral for debt). Williamson (1988) and Shleifer and Vishny (1992) argue that more liquid assets increase optimal leverage. Williamson (1988) also posits that assets that are more liquid, or more "redeploy able" should be financed with debt more often, because banks and public debt markets incur lower costs from financing these assets. That is, liquid assets are less costly to monitor and liquidate for bondholders. Therefore, higher asset liquidity increases the amount of capital firms that can be borrowed, as well as the optimal leverage. This positive relationship is consistent with the tradeoff theory, assets with high liquidation value and lower expected bankruptcy costs can support more debt and should be positively related to debt ratios.

**Profitability**

In this research, profitability variable has no significant influence towards DER whereas it can be concluded from the coefficient regression that profitability has a positive relation with capital structure. Although there is

no significant effect, a positive relationship between profitability and DER shows that there is a positive tendency that the higher profit is obtained, it is likely that company prefers using more external financing. To absorb the required capital, companies are forced to generate enough profit to provide good return for investors and creditors. Long-term sustainability of a company depends on its ability in generating income for meeting all the obligation and providing good return for major shareholders.

The findings are not considered to support pecking order theory that the effect of profitability is negative and statistically significant. Higher profitability firms tend to have less debt. Based on pecking order theory, in a case with asymmetrical information between manager and outsource investors, managers prefer financing from internal sources to external ones, where external finance is costly and where retaining earnings as liquid assets serve a precautionary motive.

According to this theory, if external finance is required, the first choice is to issue debt, hybrid, and then eventually equity as a last resort. Companies with less profitability ask for loan. This behavior may be due to the costs of issuing new equity, as a result of asymmetric information or transaction costs. All things being equal, the more profitable the firms are, the more internal financing they will have.

### Asset Structure

In this research asset structure variable significantly affects capital structure. Asset structure is negatively related to DER while the tradeoff theory predicts tangibility to be positively related to debt levels for two main reasons, namely security and the costs of financial distress. First, tangible assets normally provide high collateral value relative to intangible assets, which implies that these assets can support more debt. Second, tangible assets often reduce the costs of financial distress because they tend to have higher liquidation value. Assets that are tangible are more desirable from the point of view of creditors because they are easier to repossess in bankruptcy states.

According to the pecking order theory and the trade-off theory, a firm with a large amount of fixed asset can borrow at a relatively lower rate of interest by providing the security of these assets to the creditors. Having the incentive of getting debt at a lower interest rate, a firm with a higher percentage of fixed asset is expected to borrow more as compared to a firm whose cost of borrowing is higher because of having less fixed assets.

### Firm Size

In this research firm size has no significant effect to capital structure while firm size has been empirically found to be strongly positively related to capital structure. Many studies on capital structure suggest that there is a positive relationship between leverage and size of the firm.

Large firms may be able to take advantage of economies of scale in issuing long-term debt, and may even have bargaining power over creditors. So the cost of issuing debt and equity is negatively related to firm size. In addition, larger firms often diversify their financing sources and have more stable cash flows, hence have lower variance of earnings, making them able to tolerate high debt ratios (Castanias, 1983; Titman and Wessels, 1988; Wald, 1999), and so the probability of bankruptcy for larger firms is less, relative to smaller firms.

### Asset Growth

In this research, asset growth has no significant effect to capital structure. There is a positive relation between asset growth and DER. It is explained that growth orientation for company is needed to raise capital (equity investment) from external sources, because company does not have enough its own resources or cannot access loans.

However, many investor are reluctant to invest in start-ups and innovative firms because of the high risks and transaction costs, or because the estimation that the expected returns will not compensate for the risk. The problem of investment is about the tendency by highly levered firms to pass up profitable investments. The reason for this is that when debt levels are high, investors are reluctant to provide further equity funds because they are aware of the fact that cash flows which are generated from investments will go to service debt before any is returned to them.

The greater the asset of a company is more likely to make a profit. Greater company's profits would certainly increase the value of the assets as well and it can continue to convince the creditors of the company. It is based on the belief of creditors on funds invested in the company secured by the amount of assets owned by the company.

## 5   Conclusion

The starting point for understanding the concept of capital structure is that the companies own assets that are generated by its process and investment activities. Appropriate capital structure decisions will minimize the cost of capital and increase firm's value. Therefore, it is important for the firm's manager to understand the theory of capital structure.

Based on the analysis and discussion that has been done in the previous chapter, it can be concluded several things as follows:

1. From the five (5) independent variables there are two (2) variables that have a significant effect with Capital Structure in sector of Food and Beverages Company; they are Liquidity and Asset Structure with significant negative correlation. And the other remaining three (3) independent variables which are Profitability, Firm Size, and Asset Growth do not have significant effect towards Capital Structure in sector of Food and Beverages Company.

2. According to F-Test, it is found that all five (5) independent variables altogether have a significant influence on Capital Structure in sector of Food and Beverages Company.

# On the Economical Impacts of Cloud Computing in Information Technology Industry

Asst. Prof. Dr. Ediz Şaykol (Beykent University, Turkey)

## Abstract

Cloud computing, as defined by United States National Institute of Standards and Technology (NIST), "... is a model for enabling convenient, on-demand network access to a shared pool of configurable computing resources (e.g., networks, servers, storage, applications, and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction." Goal of the study is to highlight the positive economical impacts of cloud computing for companies, which can be assessed by focusing on their business goals to make more profit. Under the cloud computing model, firms can rent as many virtual machines as they need at any given time, and either design or use off-the-shelf solutions to integrate company-wide data and then easily distribute access to users within and outside of the company. Hence, cloud computing converts fixed capital costs to variable costs, prevents under or over provisioning, and allows minute by minute flexibility. Hence, the companies concentrate on their own business goals on top on a stable and effective information technology backbone. Most literature on cloud computing reside in computer science resources. However, there is little work focusing on the social and economic significance of cloud computing in the economics literature. Hence, this paper first discusses the basics of the cloud computing along with its implications on information technology (IT) field, with paying special attention to economical aspects. Then, empirical results and elaborations are to be given to yield a conclusion.

## 1   Introduction

Cloud Computing can be defined in various ways. The definition given by the National Institute of Standards and Technology has focused on hardware and management views. As stated, it is a model for enabling "… convenient, on-demand network access to a shared pool of configurable computing resources (e.g., networks, servers, storage, applications and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction". Even though cloud computing is often considered as a technological term, it is actually a critical adoption in the business models for forecasting the use of the information technology (IT) to reduce cost in a general sense. As NIST implies, this cost savings can only be realized through the use of significant pooling of these "configurable computing resources" or resource pooling. According to NIST, resource pooling is the ability of a cloud to serve multiple customers with different physical and virtual resources which have been mapped dynamically (Bayrak, 2011).

In older times, the industry built their own server centers as many as needed to satisfy the demand. It is quite clear that it was time consuming since the hardware and software solutions co-exist in the server centers. Moreover, it is quite inflexible and requires more upfront investment to build up those server centers. However, cloud computing brings together existing technologies introducing service oriented architecture, distributed grid computing, virtualization and broadband networking to provide software, infrastructure, and platforms as services. That is the main fact that cloud computing has a deep impact on IT companies.

The companies in IT industry can now rent servers, instead of building its own centers under the cloud computing model. They can also use third party solutions to create a collaboration environment for their company-wide data, since mechanisms are generally provided to manage the access rights of the users/employers. Hence, cloud computing converts fixed capital costs to variable costs, and prevents under or over provisioning via providing flexibility. Moreover, from the supply perspective, the cloud computing paradigm provides economies of scale, distribution of costs among a large pool of users, centralization of infrastructures in areas with lower costs, and improved resource utilization contributes to value creation and efficiency improvements. Hence, cloud computing shares the same ideas of a disruptive general purpose technology to impact the economy as a whole with the efficiency improvements and large savings in operational costs as well as upfront capital costs of tech-startups (Armbrust et al., 2009).

In this paper, some preliminary information on cloud computing is provided in Section 2 for those who are unfamiliar to the basics of IT. Section 3 briefly discusses the economical impacts of cloud computing. Finally, Section 4 concludes the paper.

## 2   Preliminaries on Cloud Computing

Quite interestingly, even though cloud computing has been a trendy topic in the recent years (eg, (Hamilton, 2008) (Cheng, 2008) (Siegele, 2008)), there is still something unclear on its exact definition and its needs among the big players. The following three examples given in (Armbrust et al., 2009) worth revisiting here:

- Larry Ellison, the CEO of Oracle, quoted in the Wall Street Journal, September 26, 2008, that "The interesting thing about Cloud Computing is that we've redefined Cloud Computing to include everything that we already do. . . . I don't understand what we would do differently in the light of Cloud Computing other than change the wording of some of our ads."

- Andy Isherwood, Hewlett-Packard's Vice President of European Software Sales, quoted similarly in ZDnet News, December 11, 2008, that "A lot of people are jumping on the [cloud] bandwagon, but I have not heard two people say the same thing about it. There are multiple definitions out there of 'the cloud'."

- Richard Stallman thinks Cloud Computing is a trap for users—if applications and data are managed "in the cloud", users might become dependent on proprietary systems whose costs will escalate or whose terms of service might be changed unilaterally and adversely.

On the other hand, in an older paper (Parkhill, 1966), the 'computing' term is considered as a 'utility', such as electricity. However, being a utility requires loose coupling between the computing operation and the hardware corresponding to resources. As the cloud computing term has emerged, it is now possible that computing can be visualized as a utility.

### 2.1 Cloud Computing Service Models

Cloud Computing refers to both the applications delivered as services over the Internet and the hardware and systems software in the data centers that provide services to access, integrate, collaborate regarding the company-wide data. Providing services part of the software to Access data have long been referred to as 'Software as a Service (SaaS)'. Hence, the term 'cloud' is used to clarify the data is not actually there, it is 'in-the-air'. In short, the datacenters along with their hardware and software is a Cloud.

A cloud is classified with respect to the accessibility of the data served in the cloud. When a Cloud is made available to the public, we call it a Public Cloud; possibly the service is made available in a pay-as-you-go manner, and what is literally sold is Utility Computing. Current examples of public Utility Computing include Amazon Web Services, Google App Engine, and Microsoft Azure. A Private Cloud is used to refer to internal datacenters of a business or other organization that are not made available to the public (Armbrust et al., 2009).

The advantages of SaaS not only to end users but also to service providers are generally clear in minds. First of all, the service providers facilitated their software installation and maintenance processes, and hence centralized control over versioning. Similarly, the end users can access the service in an ubiquitous manner, in other words "anytime, anywhere". End users also easily share data and perform collaborations easily, since the data is kept safely in-the-air.

What Cloud Computing augment to SaaS is the fact that cloud computing gives alternatives to the providers so that they can deploy their product in the market without bothering the requirements of an appropriate data center. Companies deploy via SaaS even without actually building a data center. This actually means that the problems or inefficiencies of an owned data center are delegated (in fact transferred) to the cloud provided by the cloud user. The companies providing SaaS are the Cloud Users, and the companies who created a cloud infrastructure and selling usage are Cloud Providers.

From cloud providers' perspective, there are four major ways to adopt cloud computing technology:

- First one is a private cloud, in which the deployment the cloud infrastructure is operated for a single organization.

- Second, a community cloud is when the cloud infrastructure is shared by several organizations. It also supports a specific community that has shared interests. These cloud infrastructures may be managed by the organizations themselves or a third party.

- Third, a public cloud involves the cloud infrastructure being made available to the general public or a large industry group and is typically deployed by a separate organization selling cloud services.

- Finally, a hybrid cloud is a composition of two or more deployment models that are bound together by a technology that enables data and application portability.

The term Everything as a Service (XaaS) has been associated with many core services offered by cloud providers, including software (SaaS), development platforms (PaaS), computing infrastructure (IaaS), communication (CaaS), and data storage (DaaS), however, the most widely accepted classifications of service models focus on software, platform and infrastructure layers as the primary service models (Creeger (2009), Durkee (2010), Lin et al. (2009), Mell & Grance (2009), Viega (2009), Vaguero et al. (2009), Weinhardt et al.(2009)).

There are three widely accepted primary service models where different capabilities enabled by the cloud architecture are utilized to provide different types of services:

- Software as a Service (SaaS) is the service model where the capability provided to the consumer is the ability to use the cloud provider's applications running on a cloud infrastructure. The applications are accessible from various client devices through a thin client interface such as a web browser. Word processing and email applications such as Google Docs and Gmail or Customer Relationship Management (CRM) applications of salesforce.com are examples of this service model as well as backup, recovery and to some extent content delivery and publishing services.

- Platform as a Service (PaaS) is the service model where the capability provided to the consumer is a development or runtime environment, programming languages and application programming interfaces (APIs) to design and deploy infrastructure consumer created applications onto the cloud. Examples of these scalable services include Google App Engine, Microsoft Azure or force.com application development platforms.

- Infrastructure as a Service (IaaS) is the service model where the capability provided to the consumer is processing, storage, networks, and other fundamental computing resources. The consumer does not manage or control the underlying cloud hardware but has control over operating systems, storage, deployed applications, and possibly limited control of select networking components. These capabilities are delivered as a single server or as part of a collection of servers integrated into virtual machine environments. Amazon's Elastic Computing Cloud (EC2) is an example of IaaS.

## 3 Impacts on Information Technology

In order to discuss the economical impact of cloud computing, the following two economical market research studies can be given:

- In a recent report by Gartner forecasts worldwide cloud services market's revenue to surpass $68.3 billion in 2010 and reach $148.8 billion by 2014(Gartner Inc., 2010).

- Another recent study by IDC shows that Worldwide revenue from public IT cloud services exceeded $21.5 billion in 2010 and will reach $72.9 billion in 2015, representing a compound annual growth rate (CAGR) of 27.6% (IDC, 2012). This rapid growth rate is over four times the projected growth for the worldwide IT market as a whole (6.7%).

- By 2015, one of every seven dollars spent on packaged software, server, and storage offerings will be through the public cloud model. The cloud movement is about much more than the cloud. Cloud cannot be sufficiently understood as a standalone phenomenon in the IT market, but rather as a core ingredient of a larger transformation of the IT industry - and many other industries using IT to transform them. Hence it is quite clear that although relatively new, cloud computing is already a very significant part of the IT industry (IDC, 2012).

In deciding whether hosting a service in the cloud makes sense over the long term, it was argued that the fine grained economic models enabled by Cloud Computing make tradeoff decisions more fluid, and in particular the elasticity offered by clouds serves to transfer risk (Amburst, et. al, 2009).Although hardware resource costs continue to decline, they do so at variable rates; for example, computing and storage costs are falling faster than WAN costs. Cloud computing can track these changes—and potentially passes them through to the customer—more effectively than building one's own datacenter, resulting in a closer match of expenditure to actual resource usage.

### 3.1 Adopting the Cloud

Deciding to move an existing service to the cloud depends on

- the expected average and peak resource utilization, especially if the application may have highly variable spikes in resource demand;

- the practical limits on real-world utilization of purchased equipment; and

- various operational costs that vary depending on the type of cloud environment being considered.

Although the economic appeal of Cloud Computing is often described as "converting capital expenses to operating expenses" (CapEx to OpEx), we believe the phrase "pay as you go" more directly captures the economic benefit to the buyer. Hours purchased via Cloud Computing can be distributed non-uniformly in time (e.g., use 100 server-hours today and no server-hours tomorrow, and still pay only for what you use); in the networking community, this way of selling bandwidth is already known as usage-based pricing. In addition, the absence of up-front capital expense allows capital to be redirected to core business investment. An example to elaborate on the elasticity is given in (Amburst, et. al, 2009).

As argued in (CloudU, 2011), OpEx is beneficial for the organization, as it gives it the flexibility to terminate costs at will. With a capital purchase, the server or software being acquired is fully committed to. Regardless of whether it is being utilized, the ongoing costs still need to be borne. Contrast this with OpEx where, in the event that the item is no longer required, payments can cease rapidly. It is for this reason that many companies prefer leasing vehicles in place of purchasing them outright. The findings are given in Table 1 for a sample comparison between an internal IT, managed services (similar to SaaS), and the cloud. 29% has been gained with the use of the cloud for this typical organization.

|                      | Internal IT | Managed Services | The Cloud |
|----------------------|-------------|------------------|-----------|
| Capital Investment   | $40,000     | $0               | $0        |
| Setup Costs          | $1,000      | $5,000           | $1,000    |
| Monthly Services     | $0          | $4,000           | $2,400    |
| Monthly Labor        | $3,200      | $0               | $1,000    |
| Cost over three years| $149,000    | $129,000         | $106,000  |
| Savings Gained       | 0%          | 13%              | 29%       |

***Table 1.*** *Estimated costs of infrastructure for two application servers, two database servers and a load balancer across internal, managed and Cloud deployment models.* ***Source:*** *(CloudU, 2011).*

The primary cost of SaaS generally depends on the money spent to the data center. Hamilton presented a study to compare the costs of establishing and administering data centers (Hamilton, 2008). As shown in Table 2, for a medium-sized data center, the network usage requires 7.1 times more Money than that of very large data center. Similarly, the storage cost of medium-sized data center is 5.7 times higher than the storage cost of very large data center.

| Technology     | Cost in Medium-sized DC      | Cost in Very Large DC           | Ratio |
|----------------|------------------------------|---------------------------------|-------|
| Network        | $95 per Mbit/sec/month       | $13 per Mbit/sec/month          | 7.1   |
| Storage        | $2.20 per GByte / month      | $0.40 per GByte / month         | 5.7   |
| Administration | ≈140 Servers / Administrator | >1000 Servers / Administrator   | 7.1   |

***Table 2.*** *Economies of scale in 2006 for medium-sized datacenter (~1000 servers) vs. very large datacenter (~50,000 servers)* ***Sources:*** *(Hamilton, 2008) and (Amburst, et. al, 2009).*

An important gain of cloud computing in terms of data center costs is the fact that the risk of mis-estimating workload is shifted from the service operator to the cloud vendor. The cloud vendor may charge a premium (reflected as a higher use cost per server-hour compared to the 3-year purchase cost) for assuming this risk. Although there are sophisticated pricing models for infrastructure services (e.g., (Abramson, 2002), (Stuer, 2007)), the following simple equation is given in (Amburst, et. al, 2009):

$$\text{UserHours}_{\text{cloud}} \times (\text{revenue} - \text{Cost}_{\text{cloud}}) \geq \text{UserHours}_{\text{datacenter}} \times \left(\text{revenue} - \frac{\text{Cost}_{\text{datacenter}}}{\text{Utilization}}\right)$$

- The left-hand side multiplies the net revenue per user-hour (revenue realized per user-hour minus cost of paying Cloud Computing per user-hour) by the number of user-hours, giving the expected profit from using Cloud Computing.

- The right-hand side performs the same calculation for a fixed-capacity datacenter by factoring in the average utilization, including nonpeak workloads. Whichever side is greater represents the opportunity for higher profit.

- If Utilization = 1.0 (the datacenter equipment is 100% utilized), the two sides of the equation look the same. In practice, the usable capacity of a datacenter (without compromising service) is typically 0.6 to 0.8.

- The equation makes clear that the common element is the ability to control the cost per user hour of operating the service.

Additionally, a cloud computing user can benefit from the resource usage on the scale of hours rather than years. First, unexpectedly scaling down (disposing of temporarily underutilized equipment)—for example, due to a business slowdown, or ironically due to improved software efficiency—normally carries a financial penalty. With 3-year depreciation, a $2,100 server decommissioned after 1 year of operation represents a "penalty" of $1,400. Cloud Computing eliminates this penalty (Amburst, et. al, 2009).For example, Intel Computing Services in 2000-2001 required negotiating a contract and longer-term use than per hour (Bayrak, 2011).

Moreover, technology trends suggest that over the useful lifetime of some purchased equipment, hardware costs will fall and new hardware and software technologies will become available. Cloud providers, who already enjoy economy-of-scale buying power, can potentially pass on some of these savings to their customers. If new technologies or pricing plans become available to a cloud vendor, existing applications and customers can potentially benefit from them immediately, without incurring a capital expense. In less than two years, Amazon Web Services increased the number of different types of compute servers ("instances") from one to five, and in less than one year they added seven new infrastructure services and two new operational support options(Amburst, et. al, 2009).

As a successful example, Elastic Compute Cloud (EC2) from Amazon Web Services (AWS) sells 1.0-GHz x86ISA "slices" for 10 cents per hour, and a new "slice", or instance, can be added in 2 to 5 minutes. Amazon's Scalable Storage Service (S3) charges $0.12 to $0.15 per gigabyte-month, with additional bandwidth charges of $0.10 to $0.15 per gigabyte to move data in to and out of AWS over the Internet. Amazon's bet is that by statistically multiplexing multiple instances onto a single physical box, that box can be simultaneously rented to many customers who will not in general interfere with each others' usage (Bayrak, 2011).

### 3.2 New Business Models

With the recent development to satisfy service-oriented computation to present the Internet as a utility to the end user, "tightly-coupled" business models have changed to so-called "loosely-coupled" business models. As an example to the tightly-coupled era, accepting credit card payments from strangers required a contractual arrangement with a payment processing service such as VeriSign or Authorize.net; the arrangement was part of a larger business relationship, making it onerous for an individual or a very small business to accept credit cards online. This was a typical business situation in earlier forms of the Internet.

However, in service-based era where SaaS has been perceived within the Internet, any individual can accept credit card payments with no contract, no long-term commitment, and only modest pay-as-you-go transaction fees, for example with the emergence of PayPal. The level of "touch" (customer support and relationship management) provided by these services are minimal to nonexistent, but the fact that the services are now within reach of individuals seems to make this less important.

Similarly, individuals' Web pages can now use Google AdSense to realize revenue from ads, rather than setting up a relationship with an ad placement company, which can be considered as a part of service-based business model. Moreover, individuals can distribute Web content using Amazon CloudFront rather than establishing a relationship with a content distribution network such as Akamai (Amburst, et. al, 2009).

Amazon Web Services capitalized on this insight in 2006 by providing pay-as-you-go computing with no contract: all customers need is a credit card. A second innovation was selling hardware-level virtual machines cycles, allowing customers to choose their own software stack without disrupting each other while sharing the same hardware and thereby lowering costs further (Amburst, et. al, 2009).

The development of an effective technology to make micropayments for content and services has the potential to revolutionize the web. In practice, however, consumers already do make micropayments indirectly by giving up personal information to providers of cloud services in exchange for access. For example, Facebook is an SaaS that provides storage and networking services to its users. Users have a choice of how much information to give to the site, such as one's email address, physical address, religion, age, relationship status, pictures of you and your friends, links to content you like, content you have created, etc.. The further a user reveals information, the more sharing he can do with his friends. Similarly, when we use Google, our searches are tracked and indexed, Hulu and Netflix create records of our viewing habits, Visa and MasterCard know how much liquor we buy, Ebay, Expedia, and especially Amazon know a great deal about our consumption habits, and many other sites deposit tracking cookies (Amburst, et. al, 2009). Hence, a new business model based on data analytics has been evolved, in which content and service providers gain more money by selling or renting the accumulated information on a user to third parties, or improving the services that they provide to the end user.

### 3.3 Cost-based Evaluation

The information technology revolution of the 80's and 90's in part replaced human workers with computers and automated systems. Hence, variable costs are replaced by fixed costs. This hardened the entry of the entrepreneurs having not much Money to the business. In opposition to that, cloud computing revolution has the opposite effect. Companies no longer need to build server farms and computing services become pay-as-you-go. This is especially significant in sectors where most costs are computing services such as content delivery, web based gaming and entertainment, social networking and so on. Since companies do not need to spend high

amounts to legacy systems, they can build integrated cloud applications from the ground up. These factors make it easier for entrants to offer entertainment and other similar services. Since scale increases both revenue and costs at the same time, profitability can be maintained at variety of scales. This in turn allows new companies to offer services of particular interest to relatively small groups and also to scale up rapidly to take advantage of network externalities if they exist. Thus, the value of the intellectual property of large incumbents is reduced (Amburst, et. al, 2009).

Another economic issue of concern is that bankruptcy, reorganizations or even changes in business focus on the part of cloud service provides pose significant risks for users. In the worst case, users may lose data stored in the cloud. At a less catastrophic level, features and functionality may be dropped or no longer supported, service levels of companies distracted by internal problems may decline. This further weakens the company, and induces more customers to leave. The dynamics are very much like a bank-run (Amburst, et. al, 2009).

### 3.4 State of Turkey

In a recent research by Accenture, 8% of the small and medium scale companies keen on using cloud computing, this accumulates into more than 200 thousand and $105 billion in the market (Küstür, 2013). The Money that these firms can invest for these services is $509 per month on the average. As long as the trend of IT industry in Turkey continues, it was forecasted that by 2015, the market will have $139 billion, as stated in the same research.

The "interested" sectors in Turkey are Retail-Trade and Transportation-Storage, and the ratios and cumulative market sizes are around 40% and 14%, and $36 billion and $10 billion, respectively. It was stated in this research that the reason why only these sectors are interested is the recent advances in digital commerce. Moreover, the companies in these sectors consider reliability first, and than the cost, while choosing cloud provides. Some of these companies has already been started business with telecom operators and banking sector companies via cloud. This business model can be an example of the hybrid cloud as mentioned in Section 2.1.

As discussed further, the findings of the research in (Küstür, 2013) show that the highest percentage, 75% , of the companies tend to adopt cloud computing in Turkey is due to the companies that are more than 9 years old or the ones that are newly established. What is important behind the reason why the companies refuse to use cloud computing lies in the fact that 40% have objections on the data privacy and security of cloud services? 36% of the companies refuse because they also refuse to change their acting model of business. It is clearly seen from the findings of the research that the use of cloud services will increase if the companies are trained such that new technology can be utilized to increase productivity, efficiency, and the company-owned data can be secured. An estimate based on these states that the potential market has $214 billion by 2015.

Other than this research, there is an ongoing work between Beykent University and Crede investigating the use of data analytics among companies. The work has been supported in part by TÜBİTAK, and based on the interviews that we have had up to this time, the companies in Turkey are really enthusiastic to the new technological trends, so as Cloud Computing.

## 4   Conclusion

In this study, it is intended to highlight the positive economical impacts of cloud computing for companies, which can be assessed by focusing on their business goals to make more profit. Although the definition of the term is unclear, the achievements of cloud computing are widely perceived by the industry both local and global. Under the cloud computing model, firms can rent as many virtual machines as they need at any given time, and either design or use off-the-shelf solutions to integrate company-wide data and then easily distribute access to users within and outside of the company. Hence, cloud computing converts fixed capital costs to variable costs, prevents under or over provisioning, and allows minute by minute flexibility. As a result of that, the companies concentrate on their own business goals on top on a stable and effective information technology backbone.

In this paper, we first discuss the basics of the cloud computing along with its implications on information technology (IT) field, with paying special attention to economical aspects. The impacts during the adoption of cloud computing, the chances to create new business models and cost-based analysis on the use of cloud computing services are given. Last, we put some basic findings on the status of Turkey. It is clear that, as the global companies do, the companies in Turkey are enthusiastic to the new technological trends. Although there are objection on the data privacy, it can be eliminated via technological training.

# Type of Information Resources and Feedback Facilities for Corporate Social Responsibility Related Issues on Corporate Websites in Indonesia

Dr. Ati Harmoni (Gunadarma University, Indonesia)

Hanum Putri Permatasari (Gunadarma University, Indonesia)

## Abstract

Companies in Indonesia have made use of the official website as a medium to convey important information, including corporate social responsibility (CSR) programs to stakeholders. This study was conducted to look at the type of resources and means of feedback available on the company's website in Indonesia in terms of disclosure of CSR issues. Survey conducted on forty five (45) companies' included in the LQ45 index period 2013. A content analysis methodology was used and applied to the corporate websites of the 45 companies studied. Two type of analysis established: the content category served to identify the issues included in CSR and the information resources and feedback resources. Ten values corresponding to issues related to CSR were identified. Results showed that more companies are using information expositive form of text, images and graphics. Expositive sources rarely used form is video, while the interactive resources are used only for specific information by some companies. Means of public feedback on the web is a general email to all types of information. Other mean of feedback are telephone and facsimile.

## 1 Introduction

Currently the company is not only required to implement CSR programs in earnest but also must be able to communicate it to all stakeholders. Developments in information technology and computers, including the Internet and the World Wide Web facility (WWW), has provided a variety of media options to companies to disclose CSR programs and enhance its relationships with stakeholders. It is also because the stakeholders affected by the company, directly or indirectly, including the general public is entitled to know the aspects that come into contact with their lives. There is now also heightened demand for better corporate citizenship and greater transparency in many developing countries. However, little is known or understood about the concept and practice of CSR in these emerging markets.

Research on the public company in Indonesia shows that mining companies included in the index Bisnis-27/Sri-Kehati/LQ45 have had official website (Ati, 2011). While previous research on companies operating in basic industries and chemicals revealed that on its official website, the company has demonstrated attention to the importance of CSR information to the public, by putting CSR on the high hierarchy menu. On the other hand, the use of which expositif resources such as text, images, pictures, and graphics just shows that the web is still a one -way (unidirectional) and have shown a low interactivity with just providing feedback means limited (Ati, 2009).

Premised on the importance of CSR communication and the critical role of the Internet in contemporary corporate communication, this study examines the extent and characteristics of Web-based CSR communication undertaken by the companies in Indonesia. This study was conducted to provide a wider picture of the use of the official website as a means of communication of CSR by companies operating in Indonesia. The study focuses on the type of resources and sources of feedback available on the company's website in Indonesia in terms of disclosure of CSR issues. Information resources and feedback resources to show how important the company saw its stakeholders and how companies dialogue with them.

## 2 Background

There are several definitions regarding CSR, the following ones are examples of established meanings. The World Business Council stated that "Corporate Social Responsibility is the continuing commitment by business to behave ethically and contribute to economic development while improving the quality of life of the workforce and their families as well as of the local community and society at large" (Holme/Watts, 2000). The European Commission defines it in their 'Grünbuch' as "a concept whereby companies integrate social and environmental concerns in their business operations and in their interaction with their stakeholders on a voluntary basis" (European Commission, 2010). The second definition clearly states that social and environmental issues are key components of CSR. When expanding these by incorporating the economic scope, the three dimensions of CSR can be defined.

CSR communication via the corporate Web has been a direct offshoot of the digital revolution. Esrock and Leichty (1999) noted that corporate Websites allow companies to engage in multi-stakeholder dialogue, a practical challenge of CSR communication. The Web also offers organizations the opportunity to design

messages that do not have to follow the dictates of gatekeepers as with print and electronic media. Hence, Web pages are available option for corporations to set and present an agenda on CSR.

Whether corporations are doing a good job of fully exploiting the Internet's potential for their CSR communication is debatable. One of the earliest related studies (Esrock & Leichty, 1998) found that even though 90% of Fortune 500 companies had Web pages (of which 82% addressed at least one CSR issue), corporate Web sites were still not being used to their full potential as a medium for communicating socially responsible activities.

According to a 2004 CSR Online Survey of Financial Times Stock Exchange companies, although many companies included CSR information on their Web site, "all too often, CSR material is hidden in hard-to-reach places, or presented as huge PDF downloads" (Coope, 2004). The study of CSR communication on the Internet has started to receive attention in the Asian context (e.g., Fukukawa & Moon, 2004; Thompson & Zakaria, 2004; Welford, 2004).

Indonesia has become the first nation in the world to introduce mandatory legal requirements for corporations to implement corporate social responsibility (CSR) reporting based on Law No 40 in 2007 regarding Limited Liability Companies (Rosser and Edwin, 2010). According to this law, all corporations that operate in Indonesia's natural resources sector or that have business activities related to natural resources must implement CSR, especially in relation to environmental responsibility, called corporate social and environmental responsibility (CSER). The CSER includes reporting activities as well as the funding to cost the activities taken from the companies' budget.

The motivation of corporations to invest on CSR in Indonesia varies, but almost all are claiming the same type of problem, namely internal and external ones. The internal problems come within the corporations, for example internal management of the firms that are related to the inherent values underlying the business activities. Other problems are the lack of CSR expertise in the firms, unsupportive local and management structure and attitude, and the difficulties in adopting operational standards. The external ones driven from outside the corporations, such as the external environment which are not reachable by the firms, government related issues, customer and community behavior in general, as well as the influence of civil society organizations (Koestoer, 2007).

## 3   Methodology

Object of this study are the official web public companies operating in Indonesia. Criteria for selecting companies for this research is a company listed on the Indonesia Stock Exchange (IDX) and included in the LQ45 the period February - July 2013 (Register issued on January 25, 2013, http://www.idx.co.id). LQ45 Index is a stock price index issued by the Indonesia Stock Exchange which contains 45 stocks that meet the criteria of fundamental and technical or transactions liquidity.

| CSR Issues | Definition |
|---|---|
| Company Profile | Explanation of the enterprise's views, values, and corporate strategy. Presentation of the company's property, structure, and legal form; divisions, subsidiaries and countries with which the enterprise operates. Explanation of results |
| Goods and Services | Explanation of the enterprise's products, services, and brands from a corporate perspective and not from a commercial one (type of products, raw materials, manufacture systems, etc.) |
| Employees and HR | Declarations and explanations of its systems of contract, promotion, evaluation, and dismissal. Declarations and explanations about human rights in the enterprise (children labour, discrimination...) |
| Economic Action | Declarations and actions related to the economic impact of the enterprise in its local, regional, national, and supranational environment |
| Social Action | Declarations and actions related to the enterprise's involvement in social issues |
| Environmental Action | Declarations and actions related to the enterprise's involvement in environmental issues |
| Corporate Governance | Declarations and explanations of the enterprise's transparency, compromises in the governance of the company. Explanation of the structure of power, remunerations, responsibilities, government departments, etc. |
| Corporate Ethics | Declarations and explanations about the enterprise's ethical compromises in relation with the business and its groups of public |
| External criteria | Declarations and explanations about the interests, importance, and linking of the groups of public with the enterprise |

*Table 1. Issues of CSR. **Source**: Capriotti and Moreno (2007)*

A content analysis methodology was used and applied to the corporate websites of the 45 companies studied. Two type of analysis established: the content category served to identify the issues included in CSR and the information resources and feedback resources. Ten values corresponding to issues related to CSR (Table 1) were identified.

The information resources category allows the identification of the different resources used to present the information on CSR. Two types of resources were recognized. (1) Expositive resources are those that allow the dissemination of information, with the visitor eminently passive and receptive. These types of resources are differentiated as graphic (written text and fixed images, photos, and graphics) or audiovisual (audio and video). (2) Interactive resources are those that permit information to be obtained through active interaction, with a mainly active and participative visitor. These include hypertexts, interactive graphics, charts, and similar resources. The feedback resources category facilitates the identification of the systems available on corporate websites for visitors to ask questions, give opinions, or assess the CSR issues. Three types of possible forms of feedback were laid out: (1) general email to the company; (2) specific email linked to CSR issues; (3) other forms of feedback (questionnaires, chats, forums, blogs, etc.) that allow an assessment of or opinions on any of the issues on CSR. The latter type implies an active incentive resource to generate opinions and assessments from visitors.

## 4 Findings

Table 2 shows a list of names and addresses of companies. Of the 45 companies studied, all (100 %) has a web-accessible by Internet users.

| Name | Web Address | Name | Web Address | Name | Web Address |

***Table 2.** Website of the Companies*

### 4.1 Issues of CSR

The Internet has become an essential space through which to diffuse information about corporate responsibility. All of the companies the LQ45 present information about CSR on their webpages. Specific CSR menu also have an important presence on the corporate Web pages of the LQ45companies. Of these, 66.7% have a specific menu, and 33.3% do not. Of the enterprises with a specific menu, the majority call it "Corporate Social Responsibility" or "CSR" (42.2%), followed by "Social Responsibility" (8.9%). Three companies use "Sustainable Development" (6.7 %) and only one enterprise calls the menu "Sustainability" (2.2%).
.

| Type of Information Resources | Total | Percentage |
|-------------------------------|-------|------------|
| Menu | 24 | 53% |
| Submenu | 9 | 20% |
| Sub Submenu | 1 | 2% |
| Subdomain | 1 | 2% |
| Not Available | 10 | 22% |

***Table 3.** Website of the Companies*

CSR related issues on their websites are 53% available on specific menu, 20% in submenu, 2% in sub submenu, 2% in subdomain and 22% did not provide in specific menu, nor submenu, sub submenu and subdomain (Table 3).

The 10 CSR issues presented on the corporate websites are not homogeneous (Table 4). The most present and relevant issues are those linked to the presentation of the general characteristics of the company (corporate profile) and of its products and services. This reinforces the idea of the self-presentation function of corporate websites. These issues have an eminently descriptive and informative approach and are more commercial in perspective, rather than allowing an ethical valuation or an appraisal of the company's compromises in its production and marketing activities.

It must also be remarked that the issue of economic action does not have the prominence given to corporate profile and products and services. However, issue with a high presence is employee and human resources, and social action. Finally, a remarkable fact is that the issue of corporate ethics does not get special attention on the corporate websites.

| Issues of CSR | Presence (in %) |
|---|---|
| Company Profile | 100 |
| Goods and Services | 100 |
| Employees and HR | 82.2 |
| Economic Action | 48.9 |
| Social Action | 62.2 |
| Environmental Action | 53.3 |
| Corporate Governance | 53.3 |
| Corporate Ethics | 37.8 |
| Public Relations | 53.3 |
| External Criteria | 48.9 |

***Table 4.*** *Presence of CSR Issues on Corporate Website*

### 4.2  Resources used to present the information on CSR

As for the resources used to present the information on CSR, the results show a clear predominance of the so-called "expositive" resources over the "interactive" resources (Figure 1).

Graphic resources are the main resources that are used to transmit information on the CSR issues (used by 96% of the companies). The use of audiovisual resources can also be considered highly significant (used by 11% of the companies), because the use of these resources on the Internet is troublesome (it slows website surfing). Interactive resources are used by 9% of the companies. These resources are typical of and inherent in the Internet, and are what make it different from other media. Hence, we can declare that there is little significant presence of interactive resources for CSR issues on the websites studied.

As can be observed in Table 5, the only areas for which a suitable combination of the communication resources available (graphic, audiovisual and interactive) is used are corporate profile (a presentation of the company in general terms) and products and services, which clearly shows the importance and relevance of these sections within the websites, as compared with other CSR issues.

| | | Information resources (in %) | | |
|---|---|---|---|---|
| | | Expositive | | Interactive |
| No | Issues | Graphic | Audiovisual | |
| 1 | Company Profile | 96 | 11 | 9 |
| 2 | Products and Services | 93 | 2 | 4 |
| 3 | Employees and HR | 82 | 0 | 2 |
| 4 | Economic Action | 49 | 0 | 2 |
| 5 | Social Action | 62 | 2 | 2 |
| 6 | Environmental Action | 53 | 0 | 2 |
| 7 | Corporate Governance | 53 | 0 | 2 |
| 8 | Corporate Ethics | 38 | 0 | 4 |
| 9 | Public Relations | 53 | 0 | 2 |
| 10 | External Criteria | 49 | 0 | 0 |

***Table 5.*** *Resources of Information*

### 4.3  Feedback resources used with CSR information

With regard to the resources available to facilitate feedback (Figure 1), 82.2% of the companies in the LQ45 provided an email address whereas 91.1% had "traditional" feedback instrument for general information from website.

With regard to email, only 48.8% of the companies have a specific email address for some of the concrete CSR issues in the corresponding sections while all companies that had email given a general email address, which is for the common use of all sections on the website. The high incidence of the use of email addresses

hides two relevant deficiencies. Firstly, there is little stimulus for specific feedback on the concrete CSR issues, as the specific email addresses are a tool almost exclusively offered to shareholders and investors and for economic-financial matters (usually found in the areas devoted to financial, shareholder, or investor information). Secondly, an assessment of the information available on the websites is not favourable, as no evaluation tools (such as interactive opinion polls, opinion forms, etc.) are provided, nor are there interactive feedback tools (such as chat rooms, forums, blogs, etc.) that would allow visitors to interact with the companies or with other people about the CSR topics in real time.

*Figure 1. Feedback Resources*

## 5   Conclusion

The study concluded that corporate websites in Indonesia have type of information resources and feedback facilities for CSR related issues. Results showed that more companies are using information expositive form of text, images and graphics. Expositive sources rarely used form is video, while the interactive resources are used only for specific information by some companies. Means of public feedback on the web is a general email to all types of information. Other mean of feedback are telephone and facsimile. The analysis result showed the companies that use specific menu about CSR on their websites (66.7%) and 33.3% do not. Name of the specific menu were "Corporate Social Responsibility" "Social Responsibility", "Sustainability Development", "Sustainability", and other.

With regard to the resources available to facilitate feedback, 82.2% of the companies in the LQ45 provided an email address whereas 91.1% had "traditional" feedback instrument for general information from website. Only 48.8% of the companies have a specific email address for some of the concrete CSR issues in the corresponding sections while all companies that had email given a general email address, which is for the common use of all sections on the website.

# Worker's Remittances and Poverty in Kyrgyzstan

Dr. Kamalbek Karymshakov (Kyrgyzstan-Turkey Manas University, Kyrgyzstan)
Dr. Raziahan Abdieva (Kyrgyzstan-Turkey Manas University, Kyrgyzstan)
Burulça Sulaymanova (Kyrgyzstan-Turkey Manas University, Kyrgyzstan)

## Abstract

This paper aims to evaluate the impact of internal and international remittances on poverty in Kyrgyzstan using household survey data for 2011. Following Adams and Cuecuecha (2010) two-stage multinomial logit model suggested by Bourguigon *et al.* (2007) is used. Methodology use instrumental variables to solve the selectivity bias issue and then estimates counterfactual expenditure of households. Households are classified as international remittance receiving, internal remittance receiving and remittance non-receiving. For evaluation of remittances impact on poverty counterfactual expenditures are compared with observed actual expenditure by household types. Expenditure level for 2011 for definition of national poverty line in Kyrgyzstan is used as the benchmark for poverty impact of remittances. Results show that international remittances considerably decrease poverty level. Per capita expenditure of international remittance receiving households would be lower than expenditure of poverty line for 2011, if they did not receive remittances. Internal remittance receiving households also would decrease expenditures, but it would still be higher than poverty line.

## 1 Introduction

Remittances sent by migrants outside of Kyrgyzstan are important income source of the economy. According to the World Bank (2012) Kyrgyzstan ranks 3rd among the top 10 recipients of migrant remittances as a share of GDP. According to the World Bank forecasts in 2013 Kyrgyzstan will receive remittances as 31 per cent of GDP. Such large amount of remittances inflow contributes to mitigate deficit of balance of payments and is seen as one of the major factors in sustaining livelihood of most rural population. Because of the high proportion of consumptive expenditures in spending of remittance receiving households, channeling them into productive investment is one of the important issues for government agencies. However, understanding factors behind the use of remittances is fundamental for decision-making in policies attempting to regulate not only remittances, but also household expenditures in general in order to increase their investment activities.

Arguments on the economic consequences of remittance are controversial. Classical and widely accepted view is that remittances are rarely used in productive investments, but mostly channeled to current consumption. Chami et al. (2003) points out three major stylized facts on economic consequences of remittances derived from country-case studies: first, majority of remitted funds are spent on consumption; second smaller part goes into saving or investment; and third investments done with remittances are not necessarily productive in terms of the overall economy.

In most of the empirical studies investment is defined in real terms as physical capital investment or enterprise investments. Although spending on housing, land, education and health constitute major items in expenditure structure of remittance receiving households. Treatment of these expenditures as non-productive from long-run economic point of view is questionable. Since, durable goods increases living conditions, while expenditures on education and health are human capital investments, which in the long run are beneficial to economy. Some of the empirical studies conclude that remittances positively contribute to education status of remittance receiving households and communities (for instance, see Lopez-Cordova, 2004; Hanson and Woodruff, 2003; Cox, Edwards and Ureta, 2003; Yang, 2005). This capital formation approach to remittances provided the ground for possible "brain-gain" argument.

Strong kinship relations might cause use of remittances in festive events. Use of remittances on non-productive consumption can indirectly contribute to non-remittance receiving households. Expenditures considered as non-productive, such as on construction, funeral and weddings can generate employment and income through multiplier effect (Taylor et al. 1996; Mazzucato et al. 2006).

However, given these optimistically oriented evidences, studies on countries analogous to Kyrgyzstan by income level, such as Ghana by Adams et al. (2008) and on Tajikistan by Clément (2011) find no evidence on productive use of remittances as investment or education. In other words the question whether remittances are used productively is debatable and may vary by country specifics.

Nevertheless, as mentioned empirical evidences suggest that dominant use of remittances on consumption does not automatically imply that remittances are non-productive. Current consumption at least may result in indirect effect for non-migrant families and overall economy or some part of non-productive expenditures may be beneficial for human capital formation. Evaluation of possible effects of remittances requires full understanding of determinants behind its usage.

There are only few studies focused on remittances in Kyrgyzstan. Atamanov and Van Der Berg (2010) analyze the determinants of remittances for permanent and seasonal migrants and conclude that altruism and insurance drive remittances from seasonal migrants, while for permanent migrants bequest, loan repayment and exchange motives may be important. Atamanov and Mogilevsky (2009) using Computable General Equilibrium model simulations state that increase in remittances positively impacts all households in terms of the increased consumption and production.

To authors' best knowledge there are only two studies on the impact of remittances on expenditure of households in Kyrgyzstan. Ukueva and Becker (2010) analysing the effect of remittances on the purchase of durable goods using the Kyrgyzstan Integrated Household Survey (KIHS) data of National Statistical Committee of Kyrgyz Republic (NSCKR) and concludes that remittances positively impact purchases of durable goods.

Anderson and Kroeger (2011) investigate relationship between remittances and expenditures on education using the same Integrated Household Survey data by NSCKR for 2005-2008 years. They find that remittances and domestic transfers have not promoted investments in the human capital of children, even more negatively affected in the south and the mountain areas.

## 2  Methodology

Generally, poverty can be measured by income or expenditure. But most of the empirical literature on poverty generally uses expenditure than income. Moreover, in developing countries, like Kyrgyz Republic, presence of large scale informal economy, large share of employment in agriculture and other difficulties to accurately measure income level are major rationales for using household expenditure (for instance see: Deaton, 1997). Taking into consideration these arguments in order to estimate impact of remittances on poverty total per capita household expenditure will be used in this study.

In a general framework poverty can be argued to be affected by various factors including household characteristics, regional factors and other economic and demographic features of household. This functional relationship can be represented by the following equation.

$$EXP_i = \alpha_i + \sum \beta_j \; X_{ij} + \varepsilon_i \qquad\qquad (1)$$

Where $EXP_i$ is total expenditure of household. $X_{ij}$ is a vector of explanatory variables, which in our case along with other variables includes internal and international remittances. If the households who receive both internal and international remittance were randomly drawn from the whole population, this consumption function could be estimated using OLS method. But, there is evidence that that this may not necessarily be the case. Remittance receiving households are not randomly selected and have some unobservable characteristics that make them to decide to send migrant and receive remittances, i.e. they are rather self-selected. In this case of self-selection OLS will not give consistent and unbiased estimates. Therefore, methodology applied in the research should take into account this selectivity bias issue.

There are two main approaches in evaluation of impact of remittances on household welfare in the literature: propensity matching score and instrumental variables approach. The first approach results in unbiased estimate through designing a control group. However, this approach assumes that there are no unobservable characteristics of households that might influence the decision of household to send migrant and receive remittances. In this case, as noted above, estimation will be biased. Since households receiving remittances might have unobservable characteristics that are different from households not receiving remittances and should be taken into account in predicting household expenditure (for instance see: Bettin et al., 2012).

Second approach proposes to use instrumental variables in addressing selection bias. This approach employs two-stage estimation technique. In the first stage instrumental variables and other explanatory variables are used to predict probability of remittance receiving (internal and international) by households. Then selection correction term derived from this estimation along with other explanatory variables is used in the second stage to predict household expenditure. Thus, self-selection issue is addressed in the first stage by using instrumental variables. Given the potential self-selection issue our econometric method for estimation will be two-stage multinomial logit model with instrumental variables.

Although finding of suitable instrumental variables is difficult task, following empirical literature potential instrumental variables are migration network, distance to main road and water supply for farming.

To deal with selection bias in binary-choice cases Heckman (1979) method is generally employed. But as in our analysis households are classified in three types (no remittance receiving, internal remittance receiving and international remittance receiving), we have polychotomous-choice model. Bourguigon et al. (2007) show that Dubin and McFadden (1984) method performs better in case of polychotomous-choice model. Because of this we follow Adams and Cuecuecha (2010) and use two-stage multinomial logit model. This approach estimates a different equation for each type of households, taking into account in the estimation the selection bias.

Stating that $EXP_i$ in the equation (1) is per capita household expenditure and following Bourguigon et al. (2007) and Adams and Cuecuecha (2010) equation (1) can be rewritten as following:

$$\text{Log (EXP}_i) = \alpha_i + \sum \beta_j \, X_{ij} + \varepsilon_i \qquad\qquad (2)$$

Thus equation (2) is consumption equation, where dependent variable is per capita expenditure and Xs are explanatory variables. However, dealing with self-selection issue requires specification of choice equation which can be formulated as:

$$Y_h^* = \alpha_i + \sum \beta_j \, X_{ij} + \sum \upsilon_j \, Z_{ij} + \eta_i \qquad (3)$$

*h* is the categorical variable that describes the choices of remittance situation: 1) receive no remittances; 2) receive internal remittances; 3) receives international remittances. Hence, $Y_h^*$ is a latent function to capture a discreet observation about remittance situation of household. The vector Z represents instrumental variables and X is the vector of explanatory variables that are supposed to affect the migration decision of household. The outcome variable Log (EXP $_i$) is observed only if international remittance situation is chosen, that is, when h =1. Assuming that the $\eta_i$'s are independently and identically Gumbel distributed the choice component, as shown by McFadden (1973), can be estimated using a multinomial logit regression.

According to the Dubin and McFadden method if the choice model and the consumption model have correlated error components, then consumption equation can be corrected by including selection correction term, which is derived from the estimation of choice equation. Then, consumption equation (2) can be modified as following:

$$\text{Log (EXP}_i) = \alpha_i + \sum \beta_j \, X_{ij} + \sum \lambda_{ih} + \varepsilon_i \qquad\qquad (4)$$

where, $\lambda_{ih}$ is the selection correction term related to choice *h*. Significance of this term as variable in estimations of this equation will imply that selectivity in unobservable components matters for households receiving international and internal remittances. Putting it differently, if it is significant then estimations without this selection term would be biased.

Therefore two stage multinomial logit method consists of two stages: in the first stage remittance receiving or non-receiving choice equation is estimated using instrumental variables along with other explanatory variables; and in the second stage consumption equation is estimated using selection correction term from the first stage along with other explanatory variables. As our purpose is to evaluate impact of remittances on poverty total per capita expenditure of households will be used as the dependent variable in consumption equation (4).

## 3   Data and Variables

This study is based on the 2011 data of "Life in Kyrgyzstan" survey done by DIW Berlin which includes data of 3,000 households. The survey includes wide range of topics including information on demographics, assets, shocks, social networks, income and expenditure of households. Along with this the survey contains special data on migration and remittances. With respect to migration the survey questionnaire includes questions on number of migrant, education level, destination, employment status and duration of staying abroad. In remittances section questions on size of remittances, area of use these remittances and several other questions on household opinion on remittances. Income section of questionnaire gives the detailed information on sources of income: wage, income from agricultural enterprises or other enterprises, government social transfer payments, internal remittances and remittances sent from abroad. This data on expenditure and income of households and other characteristic data give possibility to examine the impact of remittances on expenditure pattern of households.

| | No remittances | International remittances | Internal remittances |
|---|---|---|---|
| Household size | 4.67 | 5.9 | 4.2 |

***Table 1.*** *Summary data on remittance non receiving, receiving international remittances and internal remittances households;* ***Source:*** *2011 Life in Kyrgyzstan Survey, DIW Berlin.*

Data on household budget income structure are used to classify households into three categories: receiving no remittances, receiving international remittances and households receiving domestic or internal remittances. Since remittances are measured from household budget records, remittance receiving status is not related with the existence or number of migrant household members. All remittances are cash remittances as reported in income source part of the questionnaire.

Table 1 presents summary data on households depending on their remittances status. Out of 3000 households relevant data for our survey available for 2832 households, of which 423 (14.9 per cent) received international remittances, 295 (10.4 per cent) received internal remittances, and 2114 (74.6 per cent) receives no remittances. In average remittances represents almost 33 per cent for both international and internal remittance receiving households. Households receiving international remittances in average are larger and have more male adults. Regional differences in migration tendency in Kyrgyzstan are evident. Most of the households in south region of the country receive both international and internal remittances. If to exclude remittances, then annual mean per capita income of households considerably decreases for households receiving international remittances: from 40 thousand som to 28 thousand som.

Estimation of the two-stage selection model requires inclusion of the instrumental variable, which are important for remittance receiving status in the first-stage choice equation. Studies on remittances used different instrumental variables: migration rate, rainfall shock, other short term shocks etc (for instance see: Hanson and Woodruff, 2002; McKenzie and Rapoport, 2007; Yang, 2005; Adams and Cuecuecha, 2010). In this study we specified two instrumental variables: interaction terms of issue of water supply for farming with land size owned by household; and wage income share in total per capita income of household.

Rationale behind these two variables is that Kyrgyzstan as the agricultural economy most of problems with water supply for farming will result in low productivity, which induce workers to look for another jobs and migrate. Questionnaire includes questions on types of shocks that households were affected during the last 12 month, where one option for answer is the insufficient water supply for farming and gardening. Land size also matters for household income, households with small size of land has low insufficient income from farming, which may also force household members to look for another job. Moreover, for households owning large size of lands, if water supply for farming is problematic, then influence of this factor to receive remittances is higher. Therefore, it is expected that larger the value of this interaction term, higher the probability to receive remittances.

| Household type | |
|---|---|
| Remittance receiving household | 1= non receiving |
| | 2= international remittance receving |
| | 3= internal remittance receiving |
| **Explanatory variables** | |
| Log total per capita expenditure | Logarithm of per capita total household expenditure |
| Household characteristics | Household size - number of individuals in household |
| | Number of children in 0-5 ages / household size |
| | Number of children in 6-17 ages / household size |
| | Number of male adult over 15 age / household size |
| Household head characteristics | Household head: 0 - male; 1 -female. |

| **Instrumental variables** | |
| Water supply for agriculture farming is problem | No = 0 |
| | Yes = 1 |
| Land ownership | Land size owned in hectar |
| Wage income share | Share of wage income in household total per capita income |

*Table 2: Variables description*

Low rate of job creation or low level of salaries in migrant-sending economy is one of the factors to migrate and receive remittances. In this study we measure domestic employment status of household indirectly through the share of wage in per capita total income of household. Higher share of wage in total income implies sufficient income from employment in the home country and do not induce to migrate.

Apart from the instrumental variables following the previous studies on expenditure pattern of households for estimation of choice equation explanatory variables on household characteristics, residence and location is included (see Table 2). In the estimation of second-stage equation of consumption instrumental variables are not included. But selection-correction term $\lambda_{ih}$ is included.

## 4    Estimation results

The Table 3 presents results from the first-stage equation of the multinomial logit model. The results show that household characteristics, household head characteristics and location variables are significantly related to the receipt of internal and international remittances. But the most important result in this estimation relates to the validity of the instrument variables proposed. For households receiving internal remittances both instruments are strongly significant; while for households receiving international remittances only one of them − wage income share − is significant. The estimated instrumental variables have the expected signs. For instance, the growth of wage income share in total income shows more employment and fewer migrants, which in turn causes less internal and international remittances. Similarly, the instrumental variable measuring the water farming issue and land size shows the expected sign: if water supply for farming is problematic, then it influences migration, which reasons the more remittances.

*Table 3 First stage results of IV estimates*

The results of the second-stage equation for total expenditure for each type of household: household with no remittances, households receiving internal remittances, and households receiving international remittances is reported in Table 4. The results show that, disregarding the receipt of remittances, per capita household expenditures for all households were significantly negatively influenced by household size. While higher ratio of male adult member of household to household size is associated with lower levels of expenditure for non-remittance receiving households; the higher ratio of number of children in age between 6 and 17 to total household size is associated with lower levels of expenditure for internal remittance receiving households. The results further show that the selection-correction term, $\lambda_3$, for households with no remittances and with internal remittances is significant, suggesting that estimations ignoring the selectivity part of the model would have been biased.

***Table 4:*** *Selection corrected household expenditure estimates (Dubin and McFadden Method)*

Based on the results of integrated household budget survey, which is calculated by National Statistic Committee of the Kyrgyzstan, the poverty level by consumer expenditures reduced from 39.9% in 2006 to 33.7% in 2010. And the cost value of the general poverty line in 2011 was valued at 25849 soms per year for capita, and the cost value of extreme poverty line was 16089 soms.

The table 4 shows the observed, predicted and counterfactual household expenditures per capita for three groups of households. The first counterfactual estimate represents the expenditure that households that chose to receive international remittances would have had without the receipt of international remittances. With the receipt of international remittances, the results show that the poverty status of these households improved. In other words, if these households have had chosen not to receive the international remittances, then their per capita expenditure amount would have reduced from 29 299 soms to 22 617.19 soms, which is lower than the poverty line for 2011.

The second counterfactual represents the expenditure that households that chose to receive internal remittances would have had without the receipt of remittances: in this case, the expenditure would decrease from 42 958 soms to 40 481 soms.

| | Number of observations | Observed expenditure | Estimated expenditure | Counterfactual |
|---|---|---|---|---|
| No remittance | 2103 | 41419 | 42117 | |
| International remittance | 422 | 29299 | 20808.12 | 22617.19 |
| Internal remittance receiving | 295 | 42958 | 46628.47 | 40481 |

***Table 4:*** *Total expenditures and counterfactual expenditure estimates*

## 5  Conclusions

This paper has used a large, nationally-representative household survey from Kyrgyzstan for 2011 to analyze how the receipt of internal and international remittances affects the expenditure of household and poverty. Following Adams and Cuecuecha (2010) two-stage multinomial logit model suggested by Bourguigon *et al.* (2007) is used. Methodology use instrumental variables to solve the selectivity bias issue and then estimates counterfactual expenditure of households. Households are classified as international remittance receiving,

internal remittance receiving and remittance non-receiving. For evaluation of remittances impact on poverty counterfactual expenditures are compared with observed actual expenditure by household types. Expenditure level for 2011 for definition of national poverty line in Kyrgyzstan is used as the benchmark for poverty impact of remittances.

The key findings are: first, international remittances represent important component in household expenditure; second, the international remittances considerably decrease poverty level, by increasing the expenditure level of households. Per capita expenditure of international remittance receiving households would be lower than expenditure of poverty line for 2011, if they did not receive remittances. Third, internal remittance receiving households also would decrease expenditures, but it would still be higher than poverty line.

# The Effects of the Trade and Investment Partnership Agreement on the European Union and Turkey

Asst. Prof. Dr. Pınar Bal (Beykent University, Turkey)

## Abstract

The goal of this paper is to analyze the possible effects of the Transatlantic Trade and Investment Partnership (TTIP) Agreement aimed to be signed between the European Union and the United States by the end of 2015. The TTIP is expected to have important social, economic and political benefits for the European Union and the United States. In this respect, following a short description of the TTIP, the possible effects of this agreement on the European Union, the United States as well as on world trade will be described. The effects of such an agreement on Turkey will also be examined both with respect to Turkey's already existing relations with the European Union and the United States. In parallel with these, the advantages and disadvantages of the existing Customs Union Agreement between Turkey and the European Union will be evaluated with respect to the TTIP. Based on this analysis, some policy alternatives for Turkey will be proposed that might help Turkey to overcome the current disadvantages that will result from the TTIP and that might strengthen its trade relations with both the European Union and the United States by transforming those disadvantages into advantages.

## 1  Introduction

Starting with the 16th century, trade has been perceived to be one of the most important factors for countries to increase their economic welfare and political power. In this respect, it has always been very important for countries to find new markets for their firms.

As the most powerful victor of the Second World War, the United States has also been highly motivated to establish a new world system that would be able to serve the American economic and political interests. Free trade has always been an important factor for the United States in reaching its goals in parallel with its national interests. Trade has been perceived by the United States to be a tool for creating a peaceful world order dominated by the United States. Thus; trade had a critical importance for the United States in creating wealth and power (Gilpin, 1987).

After the Second World War, the United Stated has established a global system based on free trade. With the General Agreement on Tariffs and Trade (GATT) established in 1947, 23 countries led by the United States have agreed to reduce their tariffs and quotas in an effort to make trade easier with each other. With the aim of creating a market capable of demanding the high technology products produced by the United States, the World Bank has been established in the same year with the aim of supporting infrastructure projects such as roads, highways, dams and waterways through providing long term credits. Taking into consideration that the trading nations might have difficulties in making payments for the goods that they had bought or default on their credit payments that might have put the whole system under stress, International Monetary Fund (IMF) has been established to provide short term credits. Besides, through the Bretton Woods system established in 1944, the United States has had the chance of dominating the world markets in financial terms, too. The dollar of the United States had become the reserve currency of the new economic system (Gilpin, 1987).

The United States was the dominant power of the early post-Second World War era and it was highly interested in the creation of a free trade system to provide its firms with new markets willing to buy their products with comparative advantages vis a vis the firms of other countries that had mostly been destructed by the war. However; many factors during the 1970s led to a change in the perspective of the United States. The European economies recovered quickly and the European firms started to challenge the leadership position of the American firms in world trade. In Asia, Japan and some South-East Asian countries also started to develop fast with increasing exports to the world. The low labor costs in these countries provided them with a competitive advantage in the world markets vis a vis the Western countries. As a result of these developments, the United States started to lose its dominant position and comparative advantage in world markets.

Hence, as countries other than the Unites States overcame the weaknesses in their economies after the Second World War, competition increased and world trade started to shift from the United States to the east. To be able to sell their products, countries had to look for new ways of creating comparative advantages in the world markets. In this era, new protectionism and regionalization had been the two methods utilized to deal with the new realities of the world (Gilpin, 1987). The United States had lost its previous dominance in world trade. World trading structure was changing and countries were looking for new ways of ensuring the continuation of their comparative advantages as well as their dominant positions.

New protectionism, as being one of the ways of reacting to the new realities of the changing world trading structure, involved the establishment of non-tariff barriers to restrict trade in an era where actually free trade was

being supported. The United States, Europe and other countries of the world started to use these non-tariff barriers in an effort to protect their firms and their market shares from increasing trade competition in the world.

Regionalization has been a second way of responding to the new challenges in the world trading system. Under regionalization, integration has been found to be advantageous by some countries to create a comparative advantage towards the outsiders. The European Union (EU) in Europe, the North American Free Trade Area (NAFTA) in North America, Mercosur in South America, Asian Free Trade Area (AFTA) or Association of South-East Asian Nations (ASEAN) were all initiatives of this understanding. After the 1990s, it was expected that trade would strongly grow among the members of these blocs, but also between these blocs (Schott, 2009).

In our contemporary world, as a result of globalization, trade competition has increased more than ever. The emerging economies of the world; BRICS (Brazil, Russia, India, China and South Africa) and MINT (Mexico, Indonesia, Nigeria and Turkey) countries together with a couple of other South American and Asian countries have been increasingly challenging American and European firms at the global arena and even capturing their long held markets. Weakened by the latest financial crisis and faced with increasing competition from the rest of the world, the American and European companies are looking for ways of creating new comparative advantages in the world economy in an effort to continue with their dominant position in the world markets. The Transatlantic Trade and Investment Partnership started to be negotiated between the United States and European Union can be seen as an extension of this search for newer comparative advantages that might help them to keep their dominant position in world markets vis a vis the emerging economies of the new century.

## 2 A Short Description of the Transatlantic Trade and Investment Partnership (TTIP)

Between the United States and Europe, trade and investment have always been an important factor in bilateral relations. Therefore, the idea of a transatlantic trade and investment agreement is nothing new. Serious proposals for a comprehensive trade agreement have started to come both from the Americans as well as the Europeans as early as mid-1990s. Although a Framework for Advancing Transatlantic Economic Integration has been signed in 2007, no formal agreement has been concluded yet (Felbermayr and Larch, 2013).

In 2013, the process has been revitalized. In February 13, 2013, a joint statement has been given by the President of the United States Barrack Hussein Obama, European Council President Herman Van Rompuy and European Commission President Jose Manuel Barroso, announcing the launch of negotiations for a Transatlantic Trade and Investment Partnership between the European Union and the United States (Council on Foreign Relations Website, 06.01.2014). These negotiations that have officially started on June 14, 2013 are aimed to be concluded by 2014 (American Chamber of Commerce in France Website, 2013).

The recently launched negotiations seem to have a high chance of success due to a couple of reasons. First of all; both regions perceive the TTIP as a way of overcoming the recent financial crisis that have weakened their economies. Besides, the TTIP is being planned to serve both parties to regain their comparative advantages that they have been losing to the emerging economies. Finally, TTIP is being perceived by both parties as a new forum to establish the new trade rules and regulations of the world in the new century. The existing trade rules in the world had been established by the GATT system, which had become the World Trade Organization (WTO) in 1995, through a couple of multilateral rounds of trade negotiations. The latest round of trade negotiations under the WTO; the Doha Round has started in 2001 with the aim of providing solutions to the problems of the new era. However; for the last couple of years, it has not been possible to conclude this Round with a successful outcome. Presently, doubts are increasing about the capacity of the Doha Round of trade negotiations to be concluded with an effective outcome. In this respect, the TTIP is being perceived by both parties to serve as a place for the establishment of the new rules and regulations of the present global trade regime (Felbermayr & Larch, 2013).

### 2.1 The aim of the Transatlantic Trade and Investment Partnership Agreement

The TTIP aims to bring the two most important economies of the world together by establishing the largest free trade and investment area in the world. The United States together with the EU produces half of the World Gross Product and 41% of global purchasing power is located in this region (Hamilton & Quinlan, 2013). Under the TTIP, these two economically gigantic actors will meet under one free market.

The level of existing tariff barriers between the EU and the United States is already very low. Although further tariff reductions and eliminations are still aimed under the TTIP, the major aim is to reduce or eliminate the non-tariff barriers (NTBs) (Francois, 2013). The NTBs include measures to protect consumer or worker health, the environment as well as the domestic producers with a mix of standards and regulations. Naturally, NTBs increase the cost and decrease competitiveness of firms. These NTBs, basically the different standards, have actually become the major obstacle to trade between the EU and the United States. Therefore, with the TTIP, the EU and the United States are aiming to harmonize each other's NTBs in an effort to eliminate the increased fixed costs for their firms. When standards are harmonized, exports would become easier and costs would be reduced for both parties. With the TTIP, both parties are aiming to improve the investment environment, too. In understanding the TTIP, trade is not enough, investment is very important, too. While the United States and EU

have accounted for 25% of global exports and 31% of global imports in 2011, together they have accounted for 57% of inward foreign direct investment and 71% of outward foreign direct investment (Hamilton & Quinlan, 2013).

***Table 1:*** *Trade Indicators for TPP and TTIP in 2012 (in billion dollars)* **Source:** *Kirişçi, K. (September 2013). Turkey and the Transatlantic Trade and Investment Partnership. Center on the United States and Europe at Brookings: Turkey Policy Paper Number 2, p. 10.*

Through the TTIP, the EU and the United States are aiming to strengthen their partnership and hence the Western-dominated international liberal economic order. TTIP is being structured as a way of affirming the social, economic and political values shared by the EU and the United States (Kirişçi, 2013). Besides the TTIP, the United States is also pushing for negotiations for a Trans-Pacific Partnership (TPP) with eleven Asian countries. The TTIP and the TPP together aim to introduce a new set of principles and rules known as WTO-plus standards to govern the present international economic relations (Kirişçi, 2013). Therefore, these agreements can be seen as the revision of the post Second World War international economic system in an effort to help continue the dominance of the Western liberal economy and its values.

### 2.2 The expected benefits of the Transatlantic Trade and Investment Partnership

Trade liberalization that will occur as a result of the TTIP is expected to have positive effects both in the EU and the United States. These positive effects can be examined in micro and macro levels.

At the macro level, trade and employment is expected to increase through the abolition of the customs and reductions as well as harmonization in the NTBs. Private and public investment is expected to increase, too. As a result of these reductions and harmonizations, the fixed costs of market entry are expected to fall down. This is expected to activate and motivate the small and medium sized companies. So, as a result of the TTIP, the internationalization of the small and medium sized companies is expected to increase (Felbermayr & Larch, 2013).

Overall, within the TTIP region, the GED Team from Bertelsmann Stiftung forecast that 2 million additional jobs can be created. However, in some countries TTIP might lead to job losses. The GED-Team forecasts that in Canada, job loss might reach 100.000 and in Turkey it might reach 95.000 (GED-Team, 2013).

The TTIP is expected to have strong welfare effects. With the TTIP, the prices of imports are expected to be lower and this will strengthen the purchasing power of incomes in both regions. Additionally, more products would be offered to the consumers which would lead to greater competition. Increased competition would lead to decreased prices that would serve the whole society (Baldwin & Wiplosz, 2009).

Under the TTIP, the European exports to the United States are expected to increase by 28%. At the macro level, the American gains are expected to reach €95 billion and the European gains are expected to reach €119 billion (Francois, 2013).

Germany is economically the most powerful European country and it exports a considerable volume of manufactured products to the United States. On the other hand, the United States have an important volume of trade in services to the EU. Therefore, this very important divergence in trade sets the necessary grounds for a trade negotiation in terms of improving the comparative advantages for both parties (Felbermayr, et.el., 2013).

At the micro level, with the TTIP, the many standards which were in fact different in the EU and the United States will be harmonized and replaced by mutually recognized standards. This will make trade easier and lower cost. A second very important benefit of the TTIP will be on intra-firm trade. Between the United States and the EU, there is a strong intra-industry and intra-firm trade (Felbermayr & Larch, 2013). Intra-firm trade is being taxed by both parties several times, especially when the products are unfinished. With TTIP, this tax will be eliminated which will decrease costs and increase competitiveness of the companies of both parties. Another benefit concerns the opening up of public procurement projects to companies from both sides to compete which

can benefit both the people and the companies with additional markets (American Chamber of Commerce, 2013).

Achieving the TTIP seems to be very possible due to a couple of reasons. First of all, the cost and production structures in the two blocs are very similar as well as their economic levels. They already have deep historical, cultural and political ties. These factors can make the reduction of NTBs possible which otherwise might not have been possible to achieve (Felbermayr & Larch, 2013).

### 2.3 The Effects of the Transatlantic Trade and Investment Partnership on the world

The third countries which stay outside the TTIP are expected to be negatively affected from the TTIP and as a result lose their markets and market shares as well as their competitiveness vis a vis their counterparts in the EU and the United States.

Free trade areas (FTAs) have both trade creation and trade diversion effects (Baldwin & Wyplosz, 2009). As a result of the TTIP, products that were previously bought from third countries would now be preferred to be bought from within the FTA due to the elimination or reduction in tariffs and NTBs. Under these circumstances, the third countries would be left at a disadvantage and lose these markets to the firms operating in the FTA (Baldwin & Whyplosz, 2009).

At the international arena, there might be a shift away from the multilateral trade negotiations being held under the WTO to bilateral negotiations between different groups of countries in different regions. Specifically the TTIP might lead to a push to create new bilateral agreements between other blocs who are not willing to risk being left outside and lose at the global arena. For example, Brazilians have already been pushing for a EU-Mercosur FTA in this respect (The Economist, 24.12.2013). This might prevent the conclusion of the Doha Round of trade negotiations. With the TTIP, the EU and the United States might lose their previous appetite concerning the conclusion of a multilateral agreement under the WTO but rather prefer bilateral arrangements (Kirişçi, 2013).

Globalization has made the reorganization of international trade rules a necessity. However, due to different interests between the developed and developing countries, the Doha Round has still not been concluded since 2001. So, the TTIP has a very important role in establishing the new rules and regulations of the new trade regime that is expected to provide solutions to the trade related problems of the 21$^{st}$ century. The EU and the United States perceive the TTIP as an important ground upon which to establish the new rules and show the way forward (Felbermayr & Larch, 2013).

With the TTIP and the TPP, the United States is aiming to supplement the traditional WTO based multilateral trade talks and push for bilateral negotiations with like-minded states (Kirişçi, 2013). By this way, the Western alliance will be able to find new comparative advantages and will become more powerful to compete with the emerging economies led by China. On the other hand, the TTIP would also increase the bargaining power of the transatlantic alliance in international affairs (Kirişçi, 2013).

As a result of the TTIP, those countries that are engaging in regional arrangements might lose their willingness to make concessions at the multilateral level. On the other hand, faced with a large trade bloc, the emerging, economies outside the blocs can easily be persuaded to make concessions like Turkey, Brazil, Mexico, Canada and South Africa (Felbermayr & Larch, 2013) (Baldwin & Seghezza, 2010). Therefore, the main losers from the TTIP would be those countries that already have bilateral trade agreements with the EU and the United States like Turkey, Mexico, Canada or the members of the Cotonou Agreement. The TTIP is expected to "swallow" some of the market shares of these countries (Longhammer, 2008). These countries would end up facing more EU competition in the American continent and more American competition in the EU. To get rid of this risk, these countries should sign bilateral agreements with the party that they do not have an agreement with or somehow become a part of these blocs (Kirişçi, 2013).

## 3  The Possible Effects of the Transatlantic Trade and Investment Partnership on Turkey

The Transatlantic Trade and Investment Partnership affect Turkey in two spheres. In the first sphere, Turkey's political and economic relations with the United States are at stake. In the second sphere, Turkey's political and economic relations with the EU are at stake.

### 3.1 The effects of the Transatlantic Trade and Investment Partnership on Turkey's relations with the United States

Starting from the Second World War, Turkey has been a part of the international liberal order that was established by the United States. For years, Turkey and the United States have cooperated as close allies. Both countries have memberships in common institutions like NATO, the IMF, and the World Bank. Relations between the two countries have slowed down after the end of the Cold War. In 2009, President Obama has proposed the idea of a "Model Partnership" between Turkey and the United States; however, it has not been possible to operationalize this idea significantly until the present day. According to Kirişçi, if Turkey can be

involved in the TTIP, this would give concrete life to the idea of "model partnership" and it would be the means to reconnect Turkey to the transatlantic alliance strongly (Kirişçi, 2013). This would strengthen economy and democracy in Turkey. During the visit of Turkish Prime Minister Recep Tayyip Erdoğan to the United States in May 2013, ways of involving Turkey in the TTIP has been discussed (Kirişçi, 2013) (National Interest, 16.05.2013).

| Turkey | 1992 | | | | 2002 | | | | 2012 | | | |

EU-12 for 1992, EU-15 for 2002, EU-27 for 2012
Neighborhood: Bulgaria, Greece, Romania, Moldova, Russia, Ukraine, Azerbaijan, Georgia, Iran, Iraq, Syria
Middle East: Iran, Iraq, Syria, Lebanon, Jordan, GCC, Yemen, North Africa (Egypt, Libya, Algeria, Morocco, Tunisia)
TPP: Australia, Brunei, Chile, Canada, Japan, Malaysia, Mexico, New Zealand, Peru, Singapore, USA, Vietnam.
Sub-Saharan Africa: TUIK category of "Other Africa".
Note that figures for Bulgaria, Greece and Romania appear both with the EU and Neighborhood totals; figures for Iran, Iraq and Syria appear both in the Middle East as well as Neighborhood totals and figures for U.S. appear in the TPP total.
2012 data is provisional

**Table 2:** *Trade Indicators for TPP and TTIP in 2012 (in billion dollars)* **Source:** *Kirişçi, K. (September 2013). Turkey and the Transatlantic Trade and Investment Partnership. Center on the United States and Europe at Brookings: Turkey Policy Paper Number 2, p. 12.*

Table 2 shows that the American share within total Turkish foreign trade has fallen from 9% in 1992, to 7% in 2002 and 5% in 2012. This decline actually shows that there is a need to revitalize trade relations between the United States and Turkey. TTIP can be seen as a historical opportunity to revitalize the relations between these two countries and to strengthen Turkey's ties and relations as well as place within the transatlantic partnership. If Turkey cannot be anchored to the TTIP, it might be possible to expect the share of the United States within Turkey's trade to fall further. This would push Turkey to establish new trade relations or strengthen other trade relations instead of the United States. Trade is a very important component of the present era to establish cooperation among the countries. Without trade, interdependence would not develop and as a result countries might lose their ground for cooperation and alliance. Hence, without the economic component, the long standing alliance between the United States and Turkey might be weakened in political aspects, too. In a region full of instabilities, this would be to the disadvantage of both parties. Whereas, with the TTIP it might be possible to strengthen relations to the advantage of both parties.

### 3.2 The effects of the Transatlantic Trade and Investment Partnership on Turkey's relations with the EU

Turkey's relations with the EU go back to 1963 when Ankara Agreement was signed between Turkey and the European Economic Community (EEC). In 1973, an Additional Protocol has come into effect with the aim of establishing a Customs Union in a timetable of 22 years. When all necessary preparations were finalized, the Customs Union has come into effect as of January 1, 1996. The Customs Union has been a very important catalyst in the integration of Turkey to the EU and to the Western liberal economic order. It has also been a very important supporter of Turkey's economic rise in the last couple of years. With the help of the Customs Union, Turkey has been able to align its regulations and rules in the legal and economic spheres with those of the EU and the world. Presently, Turkey ranks the 17th largest economy in the world motivated with higher ambitions for the future.

Although Customs Union has supported Turkey's modernization and economic rise in the last couple of years, due to its nature Turkey cannot become a member of the TTIP automatically due to its Customs Union Agreement with the EU since it is not a member of the EU. According to the Customs Union Agreement between Turkey and the EU, Turkey accepts to obey the common foreign trade policy of the EU applied towards the third countries. In parallel with this, when the EU signs a new FTA agreement with a third country, Turkey accepts and opens its borders freely to this country. However, the Customs Union Agreement does not require that third party

to open up its borders freely to Turkey. Therefore, for all the FTAs that the EU has finalized, Turkey has made individual attempts to establish a similar FTA with that country in an effort to obtain reciprocal rights of trade with that country. In the same manner, concerning the TTIP, Turkey will be required to open up its borders to the United States due to its Customs Union Agreement with the EU. However, the United States will not be required to open up its borders to Turkey reciprocally. Therefore, the TTIP being negotiated between the EU and the United States presents a disadvantage for Turkey (Longhammer, 2008), (Kirişçi, 2013) and threatens its future economic and political performance.

Table 2 shows that the EU's share within the total foreign trade of Turkey has fallen from 48% in 1992 to 47% in 2002 and to 38% in 2012. This decline can partially be explained due to the financial crisis that the EU has been struggling since 2008. On the other hand, over the years, Turkey has been able to increase its total trade volume notably with its neighbors and specifically with China. However, with the TPP countries, its trade has fallen from 15% in 1992 to 11% in 2002 and even to 8% in 2012.

Despite the decreasing percentage of trade with both the United States and the EU, the share of the United States and EU countries within total Turkish foreign trade is about 43% which is a very high volume making these markets still very important for Turkey. Therefore, Turkey should not be left outside of any deal that will be finalized between these two parties.

As mentioned before, the United States and EU are trying to restructure the international trading regime with bilateral or regional agreements. Trade is expected to concentrate within these regions where special agreements are taking place as well as between the regions. Hence, in parallel with these, there might be new deals between the TTIP and TPP in the near future. According to Table 1, TPP together with prospective members account for 18.2% of world GDP and their share in world's total trade is 18.7%, higher than the EU or the United States. Therefore, TTIP serves as a very important connection for Turkey to establish ties with that part of the world where trade is rapidly shifting to. In 2012, the TTIP, TPP and the prospective new countries together have constituted 63% of the world's GNP and 42% of world trade. This makes up a huge market with common regulatory systems, rules and harmonized policies which will make it very easy and advantageous for the members to engage in trade. For the outsiders, making trade will become harder and higher cost. It is highly possible that the outsiders will lose some of their markets within these regions to the local firms of those regions.

## 4   Policy Alternatives for Turkey

When TTIP and TPP are concluded, Turkey will be located in the middle of these huge regional trade blocs. Turkey with high ambitions to become one of the most successful economies of the world in the years to come, cannot and should not stay outside such an important formations. The future trade regime is being shaped within and between these blocs. So, Turkey should also become a member of these blocs. Looking back at the post Second World War developments, Turkey is already a prominent member of the Western alliance; therefore, trying to include Turkey within these developments should not be so hard.

Practically, the Customs Union Agreement between Turkey and the EU seem to be the root of the problem in the sense that this agreement does not let Turkey to enter the US markets freely while it gives the US this right. If Turkey had been a member of the EU, such a problem would not be valid. However; if the Customs Union Agreement was not signed and put into force, it would again be very hard for Turkey to push for a way of getting itself to this TTIP deal. Since Turkey already has the Customs Union Agreement with the EU for the last couple of years, it has already harmonized its regulations, rules, laws and policies with the EU. Presently, this gives Turkey the grounds to push for making an arrangement to include Turkey in the TTIP deal as well. If the Customs Union has not been in place and if the necessary adaptation of Turkey has not yet taken place, Turkey would not even be able to argue to become a member of the TTIP.

Based on these grounds, there are two strategies for Turkey to work on. The first one concerns the United States. Turkey can ask the United States to sign a separate FTA with Turkey. So Turkey would also have access to the American markets without any disadvantages. This can be seen as a good starting point to operationalize the "Model Partnership" that was established to enhance relations with Turkey. However, under these circumstances, Turkey would not become an actual part of the TTIP. It would not be a part of the decision making structure. Therefore, it would not be in a position to manage its interests within the TTIP. This strategy can only minimize the threat that TTIP would present on Turkey.

The second strategy concerns the European Union. As mentioned before, there is already a Customs Union Agreement between Turkey and the EU. Based on Table 2, it is possible to argue that the Customs Union is not able to increase trade between Turkey and the EU. The Customs Union Agreement has been very useful in harmonizing and adapting Turkey's policies, laws and regulations to the EU. However, for the time being, it seems to have completed its mission. Presently, if the EU membership is still a goal for Turkey, the stalled relations should somehow be revitalized. Otherwise, EU membership is being perceived with despair in Turkey in the last couple of years. The prospect of EU membership is losing support both from the government and from the public day by day. Although attempts have been made in 2011 to revive relations under a Positive Agenda,

tangible results have not been attained yet. The accession negotiations have opened in 2005. However, a few negotiation chapters have been opened and others are still waiting to be opened not to mention some of the blocked ones. After a rather long period of time, Chapter 22 on Regional Policy and Coordination of Structural Instruments has been opened on November 5, 2013, which has not been found to be satisfactory by the Turkish officials (Hürriyet Daily News, 05.11.2013). Therefore, both the EU and Turkey are aware of the weakening in their relations. The parties are looking for an appropriate ground to revive their relations. Under these circumstances, the best thing to do would be to restructure the Customs Union Agreement which is not serving the integration between the EU and Turkey anymore. Adjusting the Customs Union Agreement to the needs of the present day by guaranteeing that Turkey would also become a full member of the TTIP, might serve the interests of all the parties both economically and politically. There is no need to search for other alternatives to revive the integration process between Turkey and the EU. The Customs Union which cannot function is already there to help this revival.

If Turkey cannot take place within the TTIP, a third strategy comes into being. Then, Turkey's economic and political ties with the Western world might be expected to weaken further. Turkey would be forced to look for other regions in an effort to compensate for the loss of its long standing allies. This would be to the disadvantage of all.

## 5   Conclusion

With the new century, the world continues to change and adapt itself to the new developments. The trading regime of the post Second World War era is also adapting itself to the new developments. The superpower of the world, the United States has started to face increasing competition in world trade especially from the emerging economies of the globalization era. The multilateral trade negotiations that had been achieved under the WTO following the Second World War cannot function in the 21$^{st}$ century. The Doha Round of trade negotiations launched in 2001 under the WTO has still not been concluded. Under these circumstances, countries are looking for solutions in bilateral or regional agreements. The most important initiative in this respect has been the Transatlantic Trade and Investment Partnership aimed to be established between the United States and the EU. With TTIP, EU and the United States are planning to establish a huge free trade area where regulations, rules and standards have been harmonized. By this way, the transatlantic alliance is aiming to solve the many problems that they face presently like fighting unemployment, creating new jobs, building new comparative advantages that will help the dominance of the United States and the EU in world trade as well as establishing the new trade rules and standards of the new era and imposing them on the rest of the world, in other words, restructuring the trade regime that had been established at the end of the Second World War. The TTIP is being planned to be supported by another similar attempt at the Asian continent under Trans Pacific Partnership. Those countries that cannot become a part of these huge trade blocs would be at a disadvantage at the international arena.

Turkey, as being a candidate member of the EU and a long standing ally of the United States and with high motivations to continue its economic rise should also become a part of this new arrangement. Although Turkey and the EU have the Customs Union Agreement, this agreement does not provide Turkey with advantages in the TTIP but on the contrary it creates disadvantages for Turkey. As a result of the TTIP, Turkish borders are opened to the United States but the American borders are not opened to Turkey. Although Turkish trade volume with the United States is not so high, facing increased American competition in Europe would certainly hurt Turkish exporters. Besides trade and investment capacity of the world will be concentrated in these regions. Therefore, Turkey should become a part of the TTIP. Turkey should use all its "diplomatic efforts" to restructure the Customs Union Agreement in parallel with the urgent needs of the present day that will make Turkey an active member of the TTIP.

# The (No-)Impact of the Arms Embargo on the Relations between the European Union and China

Asst. Prof. Dr. Armağan Gözkaman (Beykent University, Turkey)

## Abstract

The present study focuses on the relations between China and the European Union by taking into consideration a specific matter of discord: The arms embargo, which is effective since 1987 and which has political and economic repercussions. Chinese authorities have frequently asked for the removal of the embargo, but the European authorities declined despite internal divisions. Nevertheless, commercial relations between Brussels and Beijing grow bigger and no deterioration is expected in the foreseeable future. The objective of the study is to find the reasons why the embargo may still remain in place. The reason why European authorities stick to the ban is threefold. First, their arms sales to China can lead to a shift in the balance of power with undesired consequences. Second, the European Union is backed by major powers (especially Japan and the USA) on the issue. Third, the current stalemate has not impeded the development of political and economic relations between Beijing and Brussels so far.

## 1  Introduction

Relations between the European Union and China have always been based upon political considerations (widely shaped by the human rights issue) and economic interests. The former aspect of these relations have come to fore by the brutal repression of the student-led popular demonstrations in 1989. The Chinese government's choice led to widespread international outcry. For its part, the European Community (EC) took a series of measures, beginning with an embargo on the arms sales to China, that were complemented in time by other arrangements.

Ever since, the relations between Beijing and Brussels are stained. Although successive Chinese governments reiterated their demand on the abolishment of the embargo, the European partners preferred to carry it on. There are at least three reasons why the embargo is still in place despite Chinese discontent and European divisions. The concern on a possible shift in the balance of power, foreign support brought to the European stance and the lack of a tangible impact of the embargo upon the relations between the two sides.

## 2  The Arms Embargo and Its Consequences for the EU – China Relations

In order to draw an analysis of the embargo's impact upon the relations between China and the EU, exploring two issues seems to be useful: The content of the embargo (along with the ensuing politico-juridical arrangements) and the reaction of Chinese authorities in the context of differing European approaches.

### 2.1 European Decision to Ban Arms Exports to China: A Process That Has Spread to Two Decades

At the summit that convened in Madrid on 26 and 27 June 1989, the EC's twelve member states called on the Chinese authorities to "put an end to the repressive actions against those who legitimately claim their democratic rights". They also agreed upon a number of sanctions against China including the interruption of military cooperation and an embargo on arms trading. Some of the measures had diplomatic repercussions, such as the raising of Chinese human rights questions in international fora (accompanied by the idea of demanding the expedition of independent observers with the aim of attending the trials and visiting the prisons) and the suspension of high-level meetings at ministerial level. Future cooperation projects were negatively affected by the repression of 1989 as well: They were either postponed or reduced. The twelve also exposed their willingness to postpone the examination of credit requests –both in the Community and World Bank frameworks (European Council, 1989).

The embargo did not materialize into a juridical text; instead, it was confined to a European Council declaration. This can be considered a weakness, for the member states would apply the measures agreed in 1989 in accordance with the laws and decrees that they would enact and the arrangements that they would make. On this account, it seems relevant to remind that the "the scope of the embargo [was] not clearly defined" and that the embargo did not cover "a large proportion of sensitive items" (EU Council Secretariat, 2005). It was therefore necessary to complement the declaration of embargo with a firmer formulation in order to fill its deficiencies.

The above-mentioned necessity explains the agreement of the EC member states at the Luxembourg and Lisbon European Councils of 1991 and 1992 on a series of common criteria to take into consideration while exporting armament material. There is a strong parallelism between the standards set out back then and the *Five-Power Guidelines for Conventional* elaborated by the permanent members of the United Nations Security Council in 1991. It is also important to note that the *European Union Code of Conduct on Arms Exports* adopted at the European Council of June 1998 drew upon these criteria (Bromley, 2012). Hence, one can legitimately

point to the convergence of the European Community/Union's policies of exportation in a sensitive area has developed from early 1990s on in parallel with the sensibilities in the international platform.

The European Code of Conduct takes into consideration simultaneously eight conditions. They are relative to the buyer state (respect of human rights in the domestic platform, the existence of stability within national frontiers), the political choices of the recipient government (the respect of the international law, the nature of alliances, the attitudes towards terrorism, respect of international commitments, probabilities of undesired re-exportation and the diversion of national resources for armaments), international security and the security interests of the EU member states (Council of the European Union, 2005).

There are at least two points that merit attention. First, the wide extent of the Code comes out as a useful instrument for harmonizing armament exports of the EU member states. As mentioned earlier, the ban imposed in 1989 was of declaratory nature. Second, as a brief of the European Corporate Counsel Review points out, the criteria set out by the Code inspired other nations such as Canada, Australia and the central and eastern European states.

Complementary regulations, which focused on the exportation of dual-use items, have been adopted in the first decade of the 21$^{st}$ century. The Regulation (EC) No 1334/2000 setting up a Community regime for the control of exports of dual-use items and technology was updated in 2009 by the Regulation 428/2009. The new text is, like its predecessor, legally binding and directly applicable within the entire territory of the European Union. It brings about two surpluses vis-à-vis the legislation that was in force before 2009: the controls on brokering activities and transit with regard to dual-use goods and the list of items controlled before granting an export license.

In time, EU member states could agree upon the requirements to meet and the procedures to follow for the exportation. The convergence of member states' positions had an important consequence: The deficiencies of the embargo imposed in 1989 have been filled by subsequent legal and political instruments. During this process, the specific declaration could find (and redefine) its meaning through the arrangements that covered the wider area of armament exportation. Nevertheless, as will be mentioned above, this trend did not lead to a consensus among the Europeans on the necessity and utility of the embargo.

## 2.2 European Divisions, Chinese Reactions

The EU cannot act as a coherent international actor and define a common stance against China on the issue of arms embargo. The lack of a common position makes it difficult for the member states to reach a consensus on lifting the arms embargo. Divergences are perceived at various levels of decision-making, from the intra-state level to the community level (Cuyckens, 2012).

Chinese statesmen have frequently asked for the removal of the embargo, but the European decision-makers declined despite internal divisions as asserted in the previous section. After China had been qualified as the EU's *strategic partner* in 2003, a debate on the embargo became inevitable. In such a partnership, how could Beijing accept being in a sort of black list? On the other hand, how could the Europeans ignore a very important restriction such as the arms sale within a relation that they upgraded themselves? Hence, the years 2004 and 2005 have witnessed heated debates on the issue. In December 2003, the European Council had already agreed upon reconsidering the embargo and took a similar position in 2004 by inviting the Luxembourg Presidency to work for a decision before June 2005 (European Council, 2003b & 2004). Some European states (such as France and Germany) have positioned themselves as the proponents of this campaign.

Nevertheless, a Chinese move constituted a veritable obstacle for the above-mentioned efforts to bear fruit: The anti-secession law was adopted by the National People's Congress on March 14, 2005. The law bolstered the idea of Taiwan's reunification with mainland China by peaceful means, but the use of force was an option if Taipei were to declare its independence (BBC, 2005). First of its kind, it constituted a legal basis for the hitherto verbal threat of military intervention (Rémond, 2008). The next month, a strong majority voted in the European Parliament (EP) against the lifting of the embargo (European Parliament, 2005).

Ever since, the EP's objection persists (The Economist, 2010). Nevertheless, an institutional harmony within the EU proved difficult to reach: The High Representative of the Union for Foreign Affairs, Catherine Ashton, defends the latter by saying that the "current arms embargo is a major impediment for developing stronger EU-China co-operation on foreign policy and security matters" and that the EU "should assess its practical implication and design a way forward" (Rettman, 2010). Yet, she has failed to persuade the major pro-embargo member states of the Union (Rettman, 2011a). For their part, Herman Van Rompuy (president of the European Council) and J. Manuel Barroso (president of the European Commission) have shown their stance on the issue by defending "responsible" controls on the arms trade (Nikkei Asian Review, 2013).

China still continues to work hard on the lifting of arms embargo and is unhappy that the solution has been elusive so far (Gardner, 2012). However, since the adoption of the anti-secession law, she cannot adopt assertive policies on the matter. She seems to have understood that a favorable decision was not imminent and that it was more realistic to initially focus on other issues of importance –such as the granting of status market economy ((Rémond, 2008).

## 3   Reasons Why the Embargo Is Still in Place

At present, there are at least three reasons why the EU preserves the ban on arms sales to China: strategic calculations, international backing and the absence of negative political and economic consequences.

### 3.1  The Concern to Prevent an Arms Race in the Region

Regional conflicts constitute a field that the European Union attaches particular importance. The European Security Strategy of 2003 identified it among the five key challenges faced by the Union (European Council, 2003a). In this context, arms export control also comes up as an important instrument. As mentioned earlier, the 1998 Code of Conduct on arms exports set up mechanisms of notification and consultation. The common position of 2008 aimed to update the Code and to reinforce the Union's export control policy (OJEU, 2008b). The Council joint action adopted the same year (which established principles and criteria for arms exports among third countries), the Council decision of 2009 which complemented it, and the ensuing Council decision of 2013 lay out further efforts undertaken by the EU (OJEU, 2008a, 2009, 2013).

The EU's arms sales to China can lead to a shift in the balance of power with undesired consequences. On this account, it should be underscored that the tension between Taiwan and mainland China creates a difficulty for the EU's decision to lift the armament ban. European arms sales to China can pave the way for a better-equipped China, which may lead to a Taiwanese reaction to reinforce its armament. The situation is all the more worrying because Taiwan may not be the only country to involve in this equation.

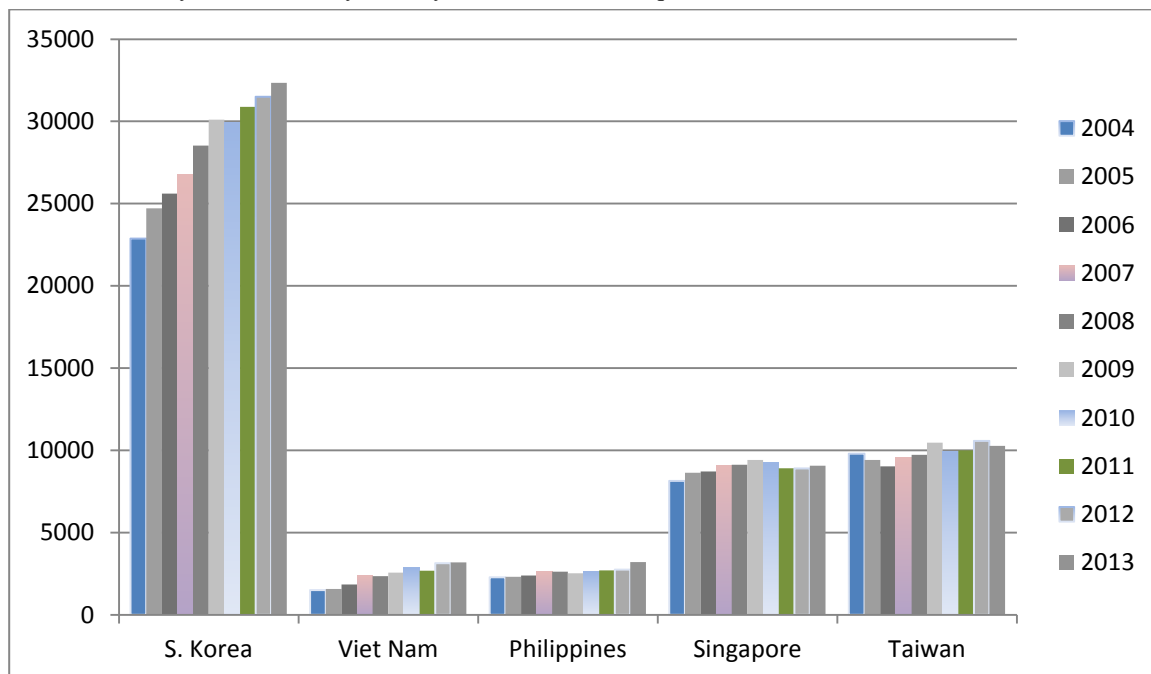

***Chart 1.*** *Trend of military expenditures in Southeast Asia in millions of dollars at constant 2011 prices and exchange rates (SIPRI Military Expenditure Database, 2014).*

Numbers speak themselves and some food for thought is provided by the Chart 1. For instance, in the selected four countries of the region (South Korea, Vietnam, Philippines and Singapore), the general trend of increase observed in military expenditures may be interpreted as "alarming". This trend can be expected to continue in the future. For this reason, the European reflex of not contributing to the arms race is understandable. Increasing the fear by providing high-technology equipment to China can jeopardize the fragile stability at the region.

It is important to remind that the EU does not have super-power-type global military ambitions. As Wacker maintains, whereas the EU formulated strategy papers for all the regions of the world and set global security goals, its military and political power is mainly concentrated on its neighborhood (2011). From this point of view, the EU will not be willing to assume a gendarmerie role in every corner of the world. Yet, because it will be significantly affected by military escalation in the Taiwan Strait, it prefers not to fuel the proliferation efforts in the region.

### 3.2  Foreign Support to the EU's Choice to Carry on the Ban

The parallelism between the reactions of the EC and the US administration to the repression of Tiananmen protesters is easy to grasp. Washington considers the EU embargo rightful and wants it to stay in place; so far, it has been very influential on the prolongation of the ban. Chinese authorities are indeed unhappy about this influence (Cottey & Gottwald, 2010). They believe that the EU should "make decisions on its own" in the future (Rettman, 2011b & 2011c).

On June 5, 1989, "all licenses and approvals to export defense articles and defense services" from the USA to China were suspended (Department of State, 1989). China is perceived by the United States as the biggest rival, both regionally and globally. Hence, any development likely to contribute to the accelerated modernization of the People's Liberation Army may be worrisome for American authorities. The Deputy Assistant Secretary of Defense for East Asia, Michael Schiffer, has pointed to Pentagon's possible concerns:

> "The pace and scope of China's sustained military investment have allowed China to pursue capabilities we believe are potentially destabilizing to regional military balances, increase the risk of misunderstanding and miscalculation and may contribute to regional tensions and anxieties. (…) Such capabilities could increase Beijing's options to use military force to gain diplomatic advantage, advance its interests or resolve military disputes in its favor." (Keyes, 2011).

In Schiffer's opinion, the challenge posed by China is relative to the regional stability in general and to Taiwan in particular. A military confrontation in the Taiwan Strait can have severe consequences for the global economy, something that goes strongly against American interests. Besides, US troops may find themselves in a military confrontation with Chinese forces due to the pledge that was made by Washington in 1979 through the *Taiwan Relations Act* which paved the way for a possible US military action in the region. The section on the implementation of US policy with regard to Taiwan stipulates that "the United States will make available to Taiwan such defense articles and defense services in such quantity as may be necessary to enable Taiwan to maintain a sufficient self-defense capability". It is the responsibility of the President and the Congress to decide upon "the nature and quantity of such defense articles and services. If a threat to the security or the social or economic system of Taiwanese people arises (and, consequently, jeopardizes the interests of the US), the President and the Congress shall determine what action the US will take to meet the challenge (American Institute in Taiwan).

Within this framework, the U.S. administrations have been selling arms to Taiwan –which provoked, unsurprisingly, Chinese authorities' strong dissatisfaction and opposition. Beijing maintains that Washington should adhere to one China policy and to the three communiqués issued jointly between 1972 and 1982. China sees the arms sales to Taiwan as an interference in its internal affairs. In Chinese view, the Taiwan question is about its territorial integrity and vital interests. Nevertheless, its strong condemnation of the USA's arms sales to Taiwan have not created an insurmountable obstacle for Beijing's relations with Washington.

The latter's considerations in exporting weaponry are multifaceted. Chinese authorities simultaneously desire to strengthen political ties, to obtain the support against strategic rivals and to gain commercial benefits (Byman and Cliss, 1999). The USA's worries are therefore threefold. First, the lifting of European embargo could improve Chinese military capabilities and strengthen Chinese superiority in the Taiwan Strait (Tang, 2005). Second, it could facilitate the transfer of military technology to the troubled regions such as Pakistan, Iran and Myanmar which are among the main clients of Beijing (Rémond, 2008). Third, it would also lead to further political advantages for China in a region to which Washington attaches a high value.

Hence, the US administrations have been against the lifting of the EU's arms embargo against China and have encouraged their traditional allies, especially Japan, to adopt a similar attitude (Rémond, 2008). Such diplomatic efforts were meant to bear fruit. In fact, Tokyo was more than ready to adopt a stance similar to that of Washington. For Japan, China's growing economic and political power and especially its highly-developed military capabilities constitute a source of concern. Governmental officials are especially preoccupied by a possible shift in the balance of the power in South East Asia. Political considerations seem to be framed in a zero-sum-game: A change in favor of China will be detrimental for Japan.

Therefore, Japanese authorities believe that although Europe's economic hardship may make the lifting of arms embargo appealing, such a decision would be a "short-sighted and dangerous" one (Swami and Moore, 2010). Japanese government's preference, especially in the context of Senkaku/Diayou islands dispute with China, will most probably be to continue its opposition to Chinese acquirement of sophisticated weaponry.

### 3.3 The EU Does Not Really Need a Change in Current Circumstances

So far, so good. The current stalemate has not impeded the development of political and economic relations so far: China has not transformed the issue into a political or military crisis. Commercial relations between Brussels and Beijing grow bigger and no deterioration is expected in the foreseeable future. As shown in the chart 1, the EU's export towards China incessantly increased for the period 2002-2012 while its import has generally shown a trend of growth as well. For the given period, the EU's import from China has more than tripled and its export has more than quadrupled.

As exposed by the chart below, from 2002 to 2012, China's share in the EU's external trade has tended to increase as well. The rise in the EU's exportation is bigger than that of its importation. In other words, the EU has found itself in a clearly advantageous position vis-à-vis its partner. Obviously, despite the bitterness expressed by Chinese authorities on several platforms, the economic relations have not been harmed by the EU's decision not to lift the ban.
*Chart 2. EU trade flows in billions of Euros between 2002 and 2012 (European Commission Directorate General for Trade, 2013).*

*Chart 3. China's share in extra-EU trade (European Commission Directorate General for Trade, 2013).*

Besides, a lifting of the embargo will most probably not result in a huge increase of arms trade. A scholar points to a number of reasons why it would not be the case (Decreton, 2009). First, because national control procedures will remain in force –they will even be strengthened through the establishment of transitional measures. Second, it is hard to expect contracts of very high value, such as a new fighter fleet or submarines because China buys them from Russia. The models supplied by Russian technology are almost as sophisticated as the ones produced by Europeans. A third reason is connected to a probability that would put China in a very difficult position in case of a conflict in the Taiwan strait: Beijing would not prefer to buy missile systems or fighter fleets from the Europeans because the latter may opt for their American ally and they may cut off the supply.

In what regards the overall cooperation between Brussels and Beijing, there is room for optimism. At the 16th China-EU summit that took place in November 2013, an *EU-China 2020 Strategic Agenda for Cooperation* that covered a wide range of issues (including peace and security, prosperity, sustainable development and people-to-people exchanges) was launched (European External Action Service, 2013b). The initiative was taken as a follow-up of the *EU-China Comprehensive Strategic Partnership* that was built up in 2003 (European External Action Service, 2013a). Obviously, both sides value their partnership and they are willing to develop the existing cooperation schemes.

## 4  Concluding remarks

Somewhat surprisingly, the embargo did not cause a heavy damage to EU-China relations. Economic and commercial relations between the European Union (EU) and China have been growing for the last two decades. Annual summits and intermittent declarations show that political dialogue continues without interruption leading to significant economic benefits for both sides.

The European Union has been successful in focusing on a particular event and to react against it without putting economic and political relations in jeopardy. China, after all, has a very peculiar position. It is one of the five permanent members of the UNSC, a huge market, a very important actor of the international trade and finance and a significant military power. Therefore, the relations with China are subject to careful attention. Europeans have shown that they are well aware of this reality.

One can argue that the opponents of the ban have had two important assets in fulfilling this highly delicate task. The one is connected to the support of strong allies –namely, the USA and Japan. The second asset concerns the impossibility for Beijing to insist on the abolishment of arms embargo as a consequence of the anti-secession law.

# Connecting Eurasia and the Americas: Geopolitical Implications of the Bering Strait Crossing in the Age of Globalization

Asst. Prof. Dr. Çağrı Erdem (Doğuş University, Turkey)

## Abstract

The Bering Strait crossing would link the entirety of Eurasia to the entirety of the Americas. There are some immense geopolitical benefits of such project. It would bring about a deep and lasting change to global economic outlook. A possible tunnel under the Bering Strait and extension of the railroad network could open vast areas of Siberia containing mineral deposits necessary for global economic growth. According to a number of respectable Russian geologists, Siberia/the Arctic region is home to considerable amount of minerals and fossil fuels. The most valued function of the Bering Strait rail system would be to release those vast natural resources trapped underneath the tundra and permafrost for the benefit of Russia and the world. These resources can be used for global economic development. Moreover, the rail project would also build development corridors in the underdeveloped parts of Russian Siberia. The development of those resources in question and their rapid transportation to the global markets can contribute to overall development of Siberia. This paper will explore/evaluate the possible benefits of the Bering Strait crossing from Russian perspective and Russia's new role in the Arctic region, under the frame of geopolitics.

## 1 Introduction

Since the end of the Cold War and the beginning of the 21$^{st}$ century, rivalries between the great powers over natural resources have become astonishingly intense. This competition has reaffirmed itself in rapid growth of commodity prices and some adjustments in geopolitical considerations. Russia has been benefiting from this situation due to its abundant natural resources on its vast territory.

The rich history of Russian political and economic relations gives ample of leadership examples. The avant-garde pushes the boundaries of what is accepted as the norm or the status quo in various issue areas. That Russian peculiarity creates many opportunities to determine Russia's place in the world. This history, in many respects, provides also commanding clues vis-à-vis Russia's current position in global political economy. Furthermore, the Bering Strait crossing project, although it seems for many as a misapprehension, reflects that Russian avant-garde drive and spirit.

The Bering Strait rail system by letting loose those vast natural resources trapped underneath the tundra and permafrost would facilitate the development of those resources in question and their rapid transportation to the global markets can contribute to overall development of those regions. There is no doubt that those rail connections in the Russian Far East (RFE) would also generate a development corridors within which new urban centers would flourish and existing ones would gain further dynamism—having an impact similar to the construction of Trans-Siberian Railroad in the early 20$^{th}$ century.

Right now, most of Siberian population is concentrated around Trans-Siberian railroad and the RFE is practically empty. As new cities erupt or the existing ones enlarge, they will magnify the erection of brand-new manufacturing businesses/assembly lines, and necessitate the construction of school systems, electricity grids, water systems, health/hospital systems; this will indubitably entail an expansion of the labor force and overall population, which in turn would increase the population density in those thinly populated areas. Equally, it would be fair to assume that, on geopolitical level, the movement of goods between Eurasia and the Americas, at previously unheard-of speeds, would revolutionize global productive connections (Deniston, 2013; Douglas, 2007; Nikishenkov, 2011; Panin, 2013).

## 2 Increased Significance of Natural Resources for Global Economic Development

It is central to emphasize the relevance of natural resources regarding the Bering Strait crossing project. Natural resources, certainly, are a source of potential international cooperation. The shared interest of producers and consumers in commodity trade can be the source of harmonious relations among states. International cooperation is needed to bring those resources from remote reserves to consumer centers. To this end, development projects such as the Bering Strait crossing can be structured in a way that all the participants would benefit from them (Moran & Russell, 2009; Ross, 2004; Russett, 1979; Stulberg, 2007; Victor & Victor, 2003; Winchester; Winrow, 2007; Yergin, 2006).

On the other hand, a competition for natural resources—necessary for any economic development— can also be a source of potential conflict between states. For instance, energy resources are regarded as a source of zero-sum or mixed-sum competition because the amount of hydrocarbons in the world is limited (Chun, 2008; Ebel, 2009). To a great extent, politics determines economics and reflects the concern for war. The view that force and the threat to use force are the salient features of the international system means that states must prepare for future

conflicts. Heavy reliance on foreign suppliers for strategic resources, such as oil, natural gas and coal, can be a threat to national security. Consequently, in a situation of a crisis or a war, access to those vital resources can be denied. Given the importance of energy to a state's ability to wage war, disruptions in supply could put national security and independence at risk.

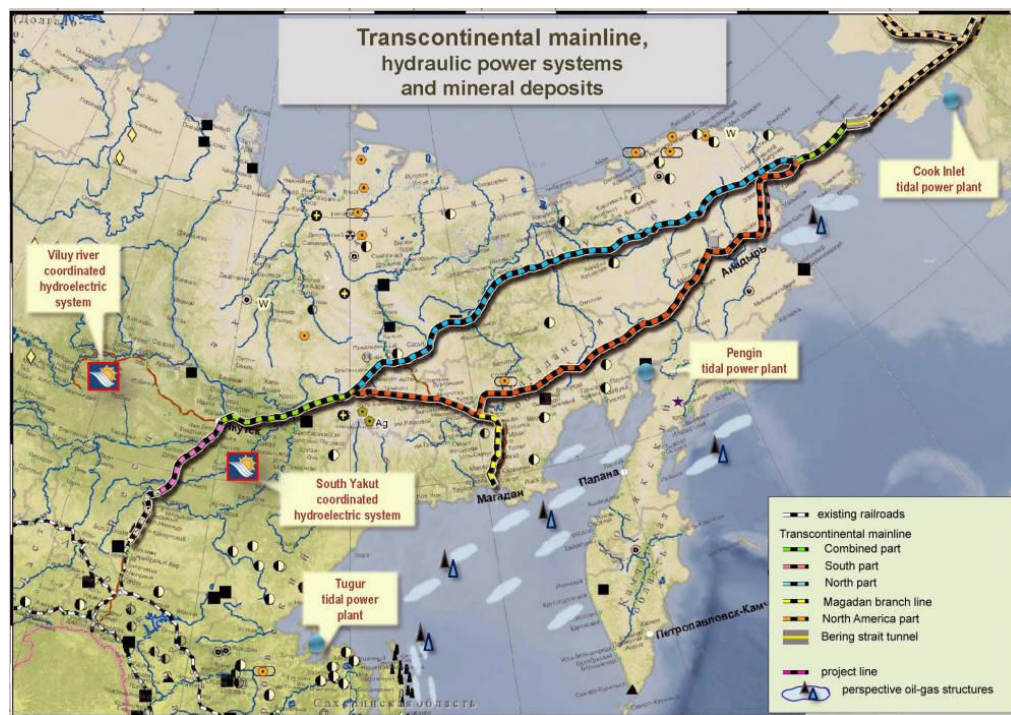

*Figure 1: Transcontinental Mainline, Hydraulic Power Systems and Mineral Deposits (Razbegin, 2011)*

In that aspect, the Siberia and Russian Arctic Region has been of particular interest to the great powers due to its possibly vast natural resources and strategic location. In fact, any sort of analysis of energy issues can no longer be reduced merely to a discussion of supply and demand in the world market, but must also focus on global energy security, from geopolitical and geoeconomic perspectives. In this milieu, major oil and gas consumers such as the United States, European Union, China, Japan, South Korea and India are paying close attention to the developments in that particular region. To this end, Russia is making every effort to retain influence over its own strategic resources (Howard, 2009).

It is critical to understand that Siberia (Akaha, 1997; Davis, 2003; Forsyth, 1992; Gentes, 2008; Groisman & Gutman, 2013; Hill & Gaddy, 2003; Hudgins, 2003; Jordan & Jordan-Bychkov; Naumov, 2006; Wood, 2011) and Russian Arctic are one of the richest regions in the world in terms of its petroleum, natural gas, coal and mineral resources. It also has immense geopolitical importance. Over the last two decades, there has been considerable interest *vis-à-vis* the Arctic region in Western academic circles (Allain, 2011; Anderson, 2009; Byers, 2009; Emmerson, 2010; Erdem, 2013; Gerhardt, Steinberg, Tasch, Fabiano, & Shields, 2010; Grant, 2010; Howard, 2009; Wilder, 2010; Young, 2011) and in Russian academia (Evdekimov, Vsotskaya, & Kostlev, 2012; Ivashov & Kefeli, 2012; Kharlampieva, 2011; Konovalov, 2010; Kozmenko, Selin, & Shchegolkova, 2012; Kuznetsov, 2011; Lebedev, 2011; Nikolaeva, 2010; Rudomiotkin & Nagorskiy, 2010; Savelyeva & Shiyan, 2010; Selin & Tsukertan, 2008; Sosnin & Ryzhov, 2010; Stolbov, 2009; Tamitskiy, 2012; Timoshenko, 2011; Vasilev, Selin, & Tereshchenko, 2009; Vsevolodovich, 2012).

With the advances in science and technology (particularly over the last decades), it is possible to measure and quantify the economic potential of those resources more accurately. Consequently, it would be fair to argue that this changing situation made the region more attractive for big powers surrounding it. Russia, with an extensive coastline in the Arctic zone, increased its strategic operations and started to sign some international economic agreements concerning the region (Byers, 2009; Dalby, 2003; Emmerson, 2010; Fairhall, 2010; Gerhardt et al., 2010; Grant, 2010).

## 3   Significance of the Bering Strait Crossing for Siberia and the RFE

Since the beginning of the 20th century, Russia and the United States have been holding talks on probable collaboration on this issue and gave some eminent indications of joint efforts to construct a railway tunnel under the Bering Strait to link Siberia with Alaska. During the Asia-Pacific Economic Cooperation (APEC) Forum in 2012 at Russian Pacific port city of Vladivostok, Russian Railways President asserted the fact that the project

to extend a railway line to Kamchatka and then to build a tunnel across the Bering Strait could be actualized in not a very distant future. (Douglas, 2007) The technical and financial aspects of the project is not that much related to the tunnel itself (somewhere around 100 kilometers), but in building links to the tunnel from existing rail lines in Russia, the United States and Canada. On the one hand, from Russian perspective, the Bering tunnel is meant to subsequently connect to the Trans-Siberian and Baikal-Amur Mainline—Байкало-Амурская магистраль – БАМ / Baikalo-Amurskaya magistral— and would require about 4,000 kilometers of rail lines to be built from Yakutsk (Sakha Republic/Yakutia). On the other hand, in the United States and Canada, approximately 2,000 kilometers of track would need to be made ready from the tunnel's landing point to the existing rail connection in Canada. It is difficult to come up with exact figures on the total cost of the project. However, estimates ranges from $35 billion to as much as $100 billion (Panin, 2013).

Moreover, Russia plans to build also a railroad that links Eurasia with Sakhalin Island—extremely well endowed in terms of natural gas fields—and eventually reaching Japan's northern island of Hokkaido. The Ministry for Development of Russian Far East said that construction will start in 2016 on the 580-kilometer railroad that will connect the Khabarovsk region and Sakhalin Island. A bridge is envisioned over the narrowest part of the Tatar Strait. The entirety of the project is estimated to be at around $10 billion (Nishimura, 2013).

In recent years, the Russian Far East (RFE) has also been a point of interest in academic circles (Alexeeva, 2008; Arsenov, Artemkina, & Zaboev, 2005; Barkovsky, 2006; Blank, 2011; Bliakher & Vasil'Eva, 2010; Kangas, 2007; Kuhrt, 2012; Nemchaninova & Buldygerova, 2012; Rozman, 2008; Sullivan & Renz, 2010; Troyakova, 2007; Vishinevskii & Demyanenko, 2010; Zausaev, 2012). It is considered as a region in crisis due to troubled economic conditions, corrupt governance, and problem-ridden cross-border relations with China, Japan, and both Koreas (Rozman, 2008). Due to the some fears that the Russian Far East might disengage itself from the center and other regional/global powers may end up having a major grip in the region, Moscow started to show some genuine interest in those eastern border provinces (Kangas, 2007).

The region in question covers a large geographical area from Siberia to Russia's Pacific coast, forming the northeastern corner of Asia. Although the Far East constitutes one-third of Russia's total landmass, it has only 6.6 million residents—4.7 percent of the total population. The low population density, just over one person per square kilometer, makes the region one of the most sparsely populated places in the world. The scarcity of residents exists alongside a wealth of natural resources that have attracted the interest of the Russian central government as well as foreign investors. Evidently, Russian politicians, bureaucrats/technocrats are all concerned about the level of socioeconomic development in that region (Troyakova, 2007).

However, it would be fair to assert that the developmental troubles of the RFE partly related to the region's history and location. The USSR did also neglect socio-economically the region until its collapse in 1991. After the disintegration of the Union, the RFE, like many other regions, was to a great extent abandoned by the financially struggling central government in Moscow. The extended negligence towards the region has left the RFE provinces economically vulnerable, demographically challenged, and geographically exposed. However, Russian government has recently begun to focus unequivocally on rejuvenating the RFE, as years of dynamic economic growth and surging global trade in neighboring China have pulled the international community's recognition to developments in the Pacific region. This transformation in the international political and economic state of affairs, particularly in view of the region's rich supplies of natural resources and strategic location, has brought about a reassessment of Moscow's policy in Russia's Far East (Alexeeva, 2008; Blank, 2011).

***Figure 2:*** *Interhemispheric Railroad & Bering Strait Tunnel Maps and Projects Future New Railroads (InterBering, 2013)*

Russian leadership considers the development of transportation infrastructure as fundamental element for uplifting those gargantuan underdeveloped regions of Siberia and the RFE. According to some experts the planned road, rail, and pipeline system would handle 3% of total global trade. Moreover, it will make it possible to connect more of eastern Russia's hydroelectric potentiality—Russian leadership envisions a 4,000-km rail line from the Lena River to the Bering Strait, as a high-priority task and very consequential. The Lena is the easternmost of Siberia's three great river systems (others being Yenisei and Ob Rivers), and is the tenth longest river in the world. Consequently, it will allow development of previously inaccessible mineral resource deposits. The connection of the power systems of Siberia, the RFE, and North America will generate considerable economies in electricity supply (Douglas, 2007).

There is no doubt that a spectacular economic growth is taking place in Asia and the world's economic center swings towards the Pacific region. The prevalence of transatlantic trade is losing momentum to the benefit of transpacific trade. Industrial regions of China, South Korea, and Japan can be linked up to Russian railroad system with the ultimate goal of connecting them to the manufacturing centers of the Midwestern United States and the critical Pacific ports in California, Washington State and British Columbia (see Figure 2). The Bering Strait crossing can be a critical raison d'être to trigger such project. Consequently, it is possible to observe a major geopolitical shift towards the Pacific region. By the same token, due to global warming, the melting of Arctic ice is opening up northern shipping routes and the Arctic development is increasingly becoming an area of significance with major untapped resource deposits. The extensive resources available in the Arctic can be developed and raw/semi-processed/processed goods can be rapidly delivered to the industrial centers in question at each end of Asia and North America, radiating the effects of a higher level of productivity throughout the global economy (Deniston, 2013).

*Figure 3: Russian Railroad Development to 2030 (Razbegin, 2007)*

## 4   Conclusion

Along the same line of logic, the current project of connecting Eurasia with the Americas has a great potential. It would be unfair to depict the conceptual framework of this project just as a railroad tunnel. This is about the construction of a major transport route connecting four continents which would include high-speed electric trains, a highway, power lines, oil and gas pipelines, fiber optics and other infrastructure. Opposing arguments, mainly from some economists, indicate serious concerns and doubts about the economic feasibility of the project. It would be important to remember that at the *Turn of the Century*, on macroeconomic level, some economists/experts claimed that the Trans-Siberian Railroad—Транссибирская магистраль/Transsibirskaya Magistra built between 1891and 1916— would also not pay for itself, but it did so in only six years. More importantly, this visionary project, politically and militarily made the Tsarist Russia a powerful player in any Eurasian geostrategic calculations. Equally, the current project would also take a number of years to complete

but would pay for itself considerably fast. It could contribute tremendously to Russian political/economic power in Eurasia.

Moreover, the Bering Strait crossing has a wider significance for global politics, security and economics due to the fact that the adjacent states with almost 30 million km² forms one fifth of earth's landmass and one third of global GDP. Russia and The United States are two of the most prominent states of the international system as permanent members of the UN Security Council.

# World Investments, Global Terrorism and the New Perception of Politic Risk

Asst. Prof. Dr. Murat Koç (Çağ University, Turkey)
Asst. Prof. Dr. Hakkı Çiftçi (Çukurova University, Turkey)

## Abstract

Based on economic power struggle, the economic strength began to take the place of military power and economic security has been considered as important as military security in this new world order. Multinational companies and their feasibility studies constitute the agenda of politic risks before entering these markets. Political risk faced by firms can be defined as "the risk of a strategic, financial, or personnel loss for a firm because of such nonmarket factors as macroeconomic and social policies, or events related to political instability". However, terrorism should be considered as a multiplier effect on some of the components mentioned above. Terrorism itself and these strict measures directly affect investments. In 2012, FDI (Foreign Direct Investment) flows into the Middle East and North Africa have been adversely affected by political risk over the past couple of years. Investor perceptions of political risks in the region remain elevated across a range of risks. The Arab Spring countries have fared worse than other developing countries in the region. The risk perception of civil disturbance and political violence, but also breach of contract, is especially prominent in Arab Spring countries. In other words, global terrorism has created a negative multiplier effect in the region. In this context, Multiplier effect can be summarized as an effect on a target, situation or event which exceed its creating strength than expected. Considering this impact, MNC's SWOT analysis and investment analysis must signify a redefinition in a wide range by the means of political risk perceptions.

## 1 Introduction

In 1991, with the Soviet Union's collapse and the end of the Cold War, the World has economically entered into a rapid integration process. Caused by the acceleration of globalization, the world has become a single market and almost all the actors have been involved in this market mechanism. Based on economic power struggle, the economic strength began to take the place of military power and economic security has been considered as important as military security in this new world order. Multinational Corporations play the major role in this system. Multinational companies and their feasibility studies constitute the agenda of politic risks before entering these markets.

## 2 Politic Risk

In a broad sense, political risk refers to the complications that businesses and governments may face as the results of what they commonly refer to as political decisions - or any political change that alters the expected outcome and value of a given economic action by changing the probability of achieving business objectives. Political risk faced by firms can be defined as "the risk of a strategic, financial, or personnel loss for a firm because of such nonmarket factors as macroeconomic and social policies (fiscal, monetary, trade, investment, industrial, income, labour, and developmental), or events related to political instability (terrorism, riots, coups, civil war, and insurrection) (Kennedy, 1988).

There are many services that measure countries' risks. The appendix provides information on the following providers:

- Bank of America World Information Services
- Business Environment Risk Intelligence (BERI) S.A.
- Control Risks Information Services (CRIS)
- Economist Intelligence Unit (EIU)
- Euromoney
- Institutional Investor
- Standard and Poor's Rating Group
- Political Risk Services: International Country Risk Guide (ICRG)
- Political Risk Services: Coplin-O'Leary Rating System
- Moody's Investor Services

Each of the index or rating providers must amalgamate a range of qualitative and quantitative information into a single index or rating (http://people.duke.edu) 11.05.2014.

In defining the concept of politic risk, they also take "environmental" factors into account that can constitute an obstacle for operations and investments of foreign economic actors. For instance, these types of factors are represented by political instability and violence. Political risk is a combination of environmental and

governmental factors that creates obstacles to the economic activity or represents a threat for the profits of foreign companies (Gori, 1988).

Long-term assessments of political risk must account for the danger that a politically oppressive environment is only stable as long as top-down control is maintained and citizens are prevented from a free exchange of ideas and goods with the outside world (Bremmer, 2007).

There are both macro- and micro-level political risks. Macro-level political risks have similar impacts across all foreign actors in a given location. While these are included in country risk analysis, it would be incorrect to equate macro-level political risk analysis with country risk as country risk only looks at national-level risks and also includes financial and economic risks. Micro-level risks focus on sector, firm, or project specific risk (Robock, 1971).

In the 2012 report on "World Investment and Political Risk" MIGA identifies eight main components, or variables of political risk (Miga, 2012):

- Transfer and convertibility restrictions: risk of losses arising from an investor's inability to convert local currency into foreign exchange transfer outside the host country. Currency devaluation is not covered.

- Expropriation: the loss of investment as a result of discriminatory acts by any branch of the government that may reduce or eliminate ownership, control, or rights of the investment either as result of a single action or through an accumulation of acts by the government.

- Breach of contract: risk of losses arising from the host government's breach or repudiation of a contractual agreement with the investor, including non-honoring of arbitral awards.

- Non-honoring of sovereign financial obligations: risk of losses due to non-compliance government guarantees securing full and timely repayment of a debt that is being used to finance the development of a new project or the enhancement of an existing project.

- War: risk of losses due to the destruction, disappearance, or physical damage as a result of organized internal or external conflicts.

- Civil disturbance: risk of losses due to social unrest.

- Other adverse regulatory changes: risk of losses for foreign investors stemming from arbitrary changes to regulations.

- Terrorism: risk of losses due to politically motivated acts of violence by non-state groups.

However, terrorism should be considered as a multiplier effect on some of the components mentioned above. Because while governments are taking strict measures to lessen the impacts of civil disturbance and war, they try to prevent their indirect effects. Terrorism itself, and these strict measures directly affect investments.

## 3 Globalization and Global Terrorism

Globalization has raised especially since 1940s. The first serious work on this issue was published at the International Encyclopedia of Social Sciences in 1968. In 1983, an American scholar, Theodore Lewitt wrote an article titled "The Globalization of Markets" and entered into the literature as a concept (Zengingönül, 2004. Akt.Ecevit, s.40).

Different sources have different definitions on concept of globalization. U.S. National Defense University describes the globalization as streaming of goods, services, money, technology, ideas, information, culture, and people across the border quickly and continuously. The United Nations Commission on Human Rights defines globalization as a process (Öymen, 2000).

In this regard, the concept of globalization means that particular ideas, opinions, practices, events, technologies and institutions are becoming definable in global scale or national identities, economies, and the boundaries have been resolved and a large part of social life in the world is determined by global processes in global scale. Globalization is a process which is ahead of the markets instead of the borders and knowledge, capital, goods and services can spread to every part of our world without limits and trouble but depending on some specific rules (Garih; 2007).

Globalization can be defined as countries' economic, political, and socio-cultural convergences and interact more strongly with each other (Ecevit; 2008).

However, most important risk posed by the concept of globalization is the easy spread of political instability. As political and economic boundaries between them have disappeared, countries and economies become more dependent on each other, the crisis that broke out in a country easily affected other countries as well.

Terrorism as a politic risk factor has become global terrorism through globalization, the threat moved up from military fronts to homes and factories. While terrorism has increased the impact of strictly taken measures, global terrorism has changed dimensions of these impacts. These new dimensions of terrorism can be defined as:

timeless, placeless and variable targeted activities. Due to the new size of the terrorism, capital flight may occur from the invested host countries.

## 4   The Concept of Global Terrorism

As the acts of violence have increased since the 1960s and gained an interstate dimension, the concept of global terrorism has found place in the discipline of international relations. International terrorism is defined as "terrorist activity that the content and the repetition has caused international consequences" However, international nature of terrorism is not limited with this definition. Acts of violence that carried out in order to influence of a foreign state's or an international organization's policy have got international nature, as well. In addition, terrorist action with the support of one or more state is considered in the same context. Terrorism that is towards to the goals of strangers or foreigners, has got international dimensions, too (Rengin, 2000).

International terrorism is aimed at human lives, internal social dynamics, international peace and security, peaceful relations of states, internal affairs, peaceful settlement of disputes, domestic law and international law to ensure the specific political, social and economic interests (Babaoğlu, 2002).

Terrorist acts involve the violences that affect the international community, and they require a collective action against the problem (Elegab, 1995).

Thus, terrorism has been recognized not only as a phenomenon of threatening world peace, stability and, security of states, but the rights of citizens as an element. In this regard, globalization encouraged and strengthened movements that we call micro-nationalism in the rate of hitherto unseen .Through the developing means of communication; small ethnic groups have the opportunity to be able to introduce themselves and make propaganda to large human populations around the world as oppressed and exploited communities (Kılıç, 2007).

At this point, the relationship between globalization and terrorism have emerged. The purpose of terrorist activities is to try to destroy the system in which terrorist groups are located, and to announce it to the world. Personalities of the victims of terrorist activities are not important, the titles they represent are only important (Özoğlu, 2005).

Global Terrorism is an ongoing struggle against the system but it works outside the system. Globalization as a political movement means that western values dominate the world, global terrorism is a phenomenon that questions the dominance of these values (Başeren, 2006) .And targets of global terrorism are MNCs, which are representing this domination the best.

## 5   Multinational Corporations, Global Terrorism and Politic Risk

With the simplest definition, a multinational corporation is a union which covers the national affiliate companies and the central offices that have different goals where the company consists of a geographically dispersed group (Ghoshal ve Bartlett, 1990).

Richard Robinson viewed multi-national companies in terms of historical development and has described these companies as follows (Robinson, 1972):

- International Company: After settling powerfully in a country as the parent company, it settled in other countries on the basis of central administration (subsidiary company) company.
- Multi-National Company: It's a kind of company in which their administrators deliver resources regardless of the identities of the country in order to get profit without a distinction between domestic and foreign activity.
- Trans-national company: The Company is characterized as multinational in which managers are of different nationalities as well as shareholders.
- Supra-national Company: The company would get a transnational form in the future. The company will be registered and audited by an organization established by an international agreement and will pay taxes to this organization, so that the company will legally lose its nationality.

Generally, national companies, which have activities in international arena and established by the national capital in any country, are named as multinational corporations (Akayın, 1972). Therefore, multinational corporations and international companies mean the same thing and there is no difference between them in terms of structure, function or law.

In terms of capital movements, the company with direct foreign capital investments that operates having foreign capital in the country, is called multinational corporation. (Ecevit, 2008)

Multinational companies are active in two or more countries, regardless of engagement fields and legal forms of economic business units. However, they are composed of such commercial enterprises that share information, resources and responsibilities among units (Şatıroğlu,1984).

Multinational companies' headquarters are in particular countries. Economic activities take place in more than one country but decisions on activities are taken centrally. At the same time, these companies hold ownership of the properties in hand and have control and power to decide on affiliated companies. (Özcan, 2011)

It is estimated that multinational corporations, which are the driving force behind economic integration in the world, are about 37,000 with extensions more than 170,000. Depending on the usage of license, these companies can be said to have larger actual influence fields (Angelfire, 2009). Approximately, 50% of world trade is carried out by multinational companies today. 2/3 of world trade and 1/3 of world income belong to these organizations. 55% of multi-national enterprises are of U.S origin, whereas 11% are of Japan, 9% are of the United Kingdom and 4.5% are of German (Kar ve Arıkan, 2003).

Approximately, total sales of 79,000 multinational companies and 790,000 foreign affiliates have accounted for nearly more than 10% of the world gross products in the world. (Özyakışır, 2007)

51 of the world's 100 largest economies are multinational corporations. These companies have powerful effects in international relations, thanks to economic power, large financial resources, and the lobby of the work (Rugman. 2003).

Political environment can be described as a platform where the central and local public administration provide its authority and use its power. This platform is composed of players who are against the political system as well (Aydın, 2013).

However, politic risk means political decisions and political and social events which affect the business climate. Terrorism refers to the losses that were made by groups which are called illegal as a result of their politically motivated and supported actions.

Asymmetric threats, summarized by Colin Gray, are unusual in the view of political, strategic and military culture and he lists as follows (Gray, 2002).

- Terrorism
- Weapons of mass destruction
- Economic
- Syber war
- Information operations
- Psychological operations
- Organized crime
- Environmental threat

Components above are put together by the terrorist organizations on a global scale. They determine their targets with these components on acting in multiple countries and try to reach political goals along these lines is called "Global Terrorism".

Thus, the resulting effect is unusual and extraordinary. It cannot be defined, as frightening and threatening in asymmetric dimension. This asymmetric dimension directly influences multinational company's political risk perceptions and will determine MNC's country preferences by the means of investment.

As mentioned above, in long-term basis, the monetary loss suffer cannot be seen as an acceptable risk by MNC's. If the host country does not have a sufficient skill to eliminate the asymmetric threats and global terrorism, MNC's choose the any "safe country" that is a natural consequence.

According to MIGA WIPR Report 2012; " (...)In 2012, FDI (Foreign direct investment) flows into the Middle East and North Africa have been adversely affected by political risk over the past couple of years. Investor perceptions of political risks in the region remain elevated across a range of risks. The Arab Spring countries have fared worse than other developing countries in the region. The risk perception of civil disturbance and political violence, but also breach of contract, is especially prominent in Arab Spring countries. Political instability in the Middle East and North Africa has taken a toll on investment intentions and has elevated perceptions of political risk, not only for the Arab Spring countries, but also for other countries in the region. Although the three-year ranking confirms the persistent concern of investors about the state of the global economy and difficulties in access in finance, political risk rises to the top of the list of constraints as the most important obstacle for investing in developing countries. This highlights the strong impact that political risk has on the investment decision-making process such that it overshadows the effects of economic weaknesses around the world."

As an assumption about regional, according to an independent global risk survey and consultancy group "CONTROLRISK 2013 Report" 37 ;(...) "In the short term, the dearth of FDI flows into the Middle East and North Africa is likely to continue, especially in those countries where there is still significant political instability. Nearly 20 percent of the foreign investors in the MIGA-EIU Political Risk Survey 2012 plan to withdraw existing investments from the Arab Spring countries."

In the light of statements above, the presence of the economic, political or social instability is one of most important factors on investment decisions that plays a negative role on which country to invest. In particular,

MNCs primarily consider the stability as decisive, and its investment decision based on this matter (Özcan, 2011).

Nevertheless, multiplier effect of global terrorism has increased the fragility of MNC's investments. The reason for that is, the new dimensions of terrorism have been targeted to economically dominant countries that own MNC's by the means of developing new micro-nationalism effects.

## 6   Conclusion:

Portfolio investors may face similar financial losses. Moreover, governments may face complications in their ability to execute diplomatic, military or other initiatives as a result of political risk. The presence of political risk and its level are more affected by the professional organizations, threat perception risk level and assessment of investors than in the past. Especially multifaceted effects caused by global terrorism and political risks asymmetry have brought a new dimension to the assesment concept. But Political risk, like all other risks, has an adverse effect on any economy. Even though other forms of risk, such as economic risk and financial risk have been studied quite extensively, political risk has not received much attention owing primarily to lack of data, Khan, Mashrur Mustaque and Akbar, Mashfique Ibne (2013). http://mpra.ub.uni-muenchen.de. 11.05.2014

After the Arab Spring, Middle East and North Africa have felt the destructive effects of terrorism on a global scale. These country-based investments have been affected by destructive aspect of this threat.

|  | 2004 | 2005 | 2006 | 2007 | 2008 | 2009 | 2010 | **2011** | 2012e |
|---|---|---|---|---|---|---|---|---|---|
| Middle East and North Africa | 9.7 | 16.8 | 27.2 | 27.9 | 29.6 | 26.3 | 22.3 | **13.7** | 19.3 |

*Table-1: Investment Amount in Middle East and North Africa* **Resource:** *MIGA-EIU – 2013*

Nine-year investment inflows in the regions of MiddleEast and North Africa are shown above. After 2004, investments doubled and have gained momentum since 2006 and investment inflows have followed a vertical increase. Direct investments reached the top especially in 2008, following a few percentage of decline the next year. However, the risks of instability, unemployment, poverty, and disparity in the regions caused a vertical decline in investments. Chaos has totally left its place to the effects of politic risk. Especially in 2011, it caused a regression by the time that Arab Spring occurred. While international direct investment inflows were 16.8 billion dollars in 2005, they fell behind 13.7 billion dollars in 2011(Table-1).

In other words, global terrorism has created a negative multiplier effect in the region. In this context, Multiplier effect can be summarized as an effect on a target, situation or event which exceed its creating strength than expected. Considering this impact, MNC's SWOT analysis and investment analysis must signify a redefinition in a wide range by the means of political risk perceptions.

Terrorism should be assessed with other effects of politic risk's components. Otherwise, this assesment could have given an erroneous result. Especially civil disturbances, war, ideologic climate, political interventions and developing new micro-nationalism affect the perception of investments directly and indirectly in the view of terrorism. Therefore, this multidimensional effect should take place in SWOT analyses with new format especially in the context of global terrorism.

Firms can score this set of questions and obtain a score that could serve as guideline:

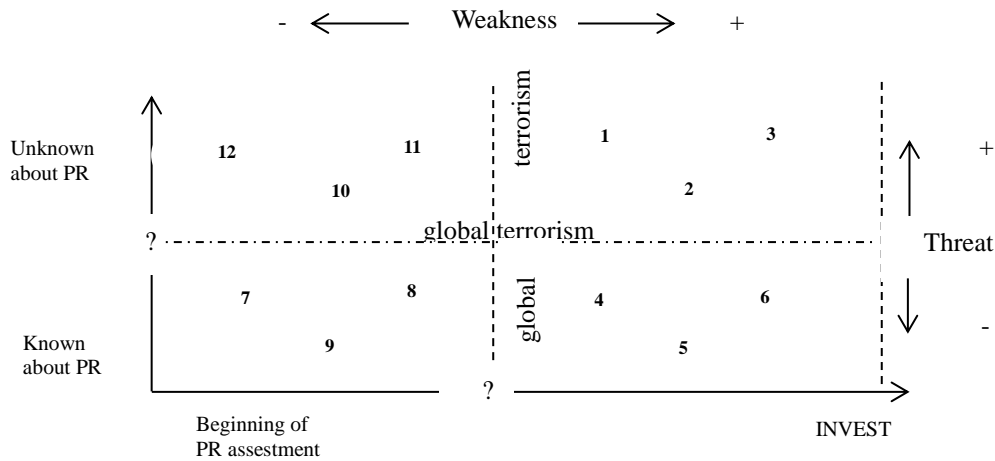
- Has the country got a democracy or dictatorship?(1)
- Is the power concentrated in the hands of one person or one political party?(2)
- Does the country normally rely on the free market or on government controls to allocate resources?(3)
- How much of a contribution is the private sector expected for the government to achieve its overall economic objectives?(4)
- Does the government view foreign firms as a means of promoting or hindering its economic goals?(5)
- Are the firm's customers in the public or private sector?(6)
- If firm's customers are in public, does the government favor domestic suppliers?(7)
- Are the firm's competitors are in the public or private sector?(8)
- If competitors are in public sector, will the government allow foreigners to compete with the public firms on even terms?(9)
- When making changes in its policies, does the government act arbitrarily, does it rely on the rules of law?(10)
- How stable is the existing government?(11)
- If the government leaves office, will there be drastic changes in the economic policies of the new government?(12)


**Figure-2:** *Global Terrorism, Politic Risk and SWOT (W/T)*

Some sample questions that may influence a firm's political risk assessment and possible answers are tried to put forth above (Figure 2) with the relation between SWOT analysis of threat and weakness assessment by the means of multiplier effect of global terrorism. As mentioned in the previous paragraphs, the impact that terrorism created, causes a threat increasing result on the firm by the means of matters that cannot be assessed and it is predicted that this impact will make the weaknesses of the company more evident in the right time to invest. In other words, while on the road to the investment decisions, uncertainty engendered especially by global terrorism is supposed to influence negatively the politic risk assessment with an increasing effect.

As a result, the perception of politic risk determines the direction of World investments. In this context, on what extent the multiplier effect and uncertainty of global terrorism influences the politic risk should be dealt with appropriate and particular questions to each country and region in SWOT analysis of threat and weakness assessment.

# Financial-Economic Crisis and Hollywood's Social Transformation Operations by Horror Movies

Asst. Prof. Dr. Ramazan Kurtoğlu (Istanbul Aydın University, Turkey)

## Abstract

The fastest change and transition in the human history is neoliberal capitalism's 30 year global free market politics project which affects every part of the world with 1978 Washington Consensus. According to John Gray who is a well known academician and an intellectual of the new right-wing, neoliberalism is an apocalyptic secular religion which is based on pagan and Christian values and its ultimate goal is post-apocalyptic heaven in the real world. The best marketing expert of this heaven is, Hollywood based American cinema industry in crisis as well as in regular times. In this study, the effects of the horror movies to the subconscious under economical crises period will be analyzed.

## 1   Introduction: Transformation for Global Open Market

The theoreticians of the New World Order use the concepts of *center* and *environment* to deal with international issues. These concepts mean that Hollywood spreads from center to environment with its transnational industry-finance complexities in the sense of economical-cultural-political globalization, and that it invades local communities with all their possessions. Over 2.5 billion of global population is deprived of basic health services. Every year, 11 million children under the age of five, in other words 30 thousand children per day die because of preventable reasons.

Throughout the human history, especially since the end of 1970s a new ground was broken. Around seven billion people experienced an unhealthy and fast change and transformation in mass. The most important engine of this change and transformation is Hollywood, the center of American film industry. The cinema films and TV series produced under the control of this center put into practice the projects that are aimed to affect the children and adults to create prototypes, which neoliberalism desires, through incredible subliminal affects. The cartoons (such as The Lion King and Mermaid) made children reach early puberty, sent sexual senses to their subconscious and created masses who possess and consume but are never content with what they have. As the publisher of Frankfurter Allgemaine Zeitung (FAZ), which is the most influential right wing newspaper of Germany, Frank Schirrmacher, who is also an early neoconservative, states in his books titled Ego-Das Spiel and Des Lebens that an egomaniac humanity has been formed.

In this process, the communication methods which persuade by entertainment rather than by force are/has been used. As a general tactic, some methods such as fear, punishment, discouragement and decent threats against individuals are used to influence individuals for attitudes and behaviors that are intended. One of the most significant medium is horror movies.

"The element of fear is one of the main elements that are used for these subconscious messages in addition to its appearance. The reaction of brain against death and fear are quite different from the ones against other things. Fear factors often take part in the hidden images used in subconscious messages. This sometimes appears through inscription, sometimes weird and fearful facial expressions, skulls and symbols."

The military doctrine that USA used in Iraq's invasion is named weirdly Bible-based and proper to the teo-political Evangelist-Christian discourses as *shock and awe*: "Shock and awe are actions that create fears, dangers, and destruction that are incomprehensible to the people at large, specific elements/sectors of the threat society, or the leadership. Nature in the form of tornadoes, hurricanes, earthquakes, floods, uncontrolled fires, famine, and disease can engender Shock and Awe."

The keystones of US government's policy are hidden in the roots of the founder legends which the founding elites/ancestors impose upon American identity. These are a-Wild West, b-Frontier, c-City Upon the Hill and d-Predestination and they all determine the strategic frame of US' domestic and international political-financial-military relations. Four of these elements mentioned above originate from Kabala and The Bible.

American journalist David L. Robb claims in his book *Operation Hollywood* that Pentagon censors war movies, and through psychological operation elements, Hollywood productions misdirect both American people and humanity. Stephen Kinzer, one of the former reporters of New York Times, states that the US takes place in global operations through three stages and the first of these stages is the demand from the US centered transnational companies. Also it is obvious that these companies are in relationship both directly and through Wall Street with big producer companies in Hollywood. It is more important to obtain public's subconscious than land.

The elements that build the collective unconsciousness are called archetypes or models. Jung names them as dominants, mythological or primitive figures, as well. An archetype is an untaught tendency that is gained through a certain experience. Archetypes don't have a peculiar form, rather it undertakes an *ordering principle*

role on the things we see or do. In other words, an archetype is like a black hole in space; the presence of which we can only tell from the object or light it inhales. The most commonly used two archetypes in unconscious messages are "birth" and "death" archetypes. The influence of these on people is high and they do not differ from one to another. The unconscious identifies the events that are related to our vital experiences which lead these two archetypes to exist and occur with these archetypes. Although fear and awe are shown as different factors in some sources, as the working principle of unconscious and brain scanning experiments clearly indicate, they are actually directly related with the death archetypes.

Some experts who evaluate and interpret the indications of restlessness and traumas that the society has, categorize such fantastic cinema genres as horror or science fiction as crisis cinema or crisis movies. "It can be said from the choice of category that cinema is in direct relationship with social changes. If the Hollywood cinema is considered, it is clear that it has parallelism with the position and ideology of US government, which is the shaper of this relationship. … The influence of economic crisis lies behind the Hollywood horror cinema, and the increase in the production of horror films cause any resistance that this crisis would build to be quelled without violence. … the scene, subject, fiction and scenario of Hollywood horror cinema vary."

## 2 Crisis – Hollywood Horror Cinema and Subconscious Operations

The Hollywood productions, part of the definition of media are not aimed only at entertainment. There definitely must be an overlap or consolidation between big Hollywood film companies and Wall Street banks, financial companies and bankers. "… In addition to its other functions, media also serves in charge of the profits of the strong communal groups who both control and finance it and it makes propaganda for them. .. It does not achieve this by brutal force; rather, it achieves it through the choice of right personnel who think in the favorable way, initiatives of editors and journalists which match the policy of the corporation, and their internalization of the criteria of newsworthiness."

Dr. Dimitry Polyvyanny, one of the professors of Ivanovo University in Russia, who came to Istanbul with Yeditepe University's invitation; is specifically known for his studies about the relativity of reality. The thesis he advocates is that: "The communities of various countries are horribly mistaken by the publication of some certain programs which do not exist in cinema and TV channels, especially in media." He names this deep diversion as CNN effect starting from the French thinker Jean Baudrillard's views.

According to the scientific researches, as the most important item of media, TV prevents the limbic system of children which is also called emotional brain from improving and thus, the brain becomes incapable of producing its own images, staying under the influence of the images only on TV and becoming thinking only within the limits of what TV presents. Another significance of limbic system on child development is that the development of limbic system in the brain, also, simultaneously improves the children's sense of conscience, which means there is a directly proportional development. If the limbic system in the brain fails to improve enough, it leads to a community of terminator derivative which does not legitimize the concept of conscience.

Another important media organ is computers and doubtlessly computer games. A research in America, which is the biggest producer of computer games, proves that these kinds of games make the children not only lazy, but also profane and aggressive. "Computer games are rapidly becoming a big part of communities, and the researches prove that the cultural, economic and social influence of this culture of game on societies are getting more and more dense."

Whereas the world is getting smaller and smaller with the leadership of transnational companies with 1978 Washington Agreement, everything from culture to gender is becoming marketable commodities. The most influential weapon of this process is the propaganda oriented to the unconscious of children, youth, women and men, in short, every aspect of the society. Thus, "the expensive movies, the film industry under the control of global bankers, global productions aimed specifically at children and youth, games and other products … They all look basically innocent… But are they really innocent?"

"The propaganda model explains the broad sweep of the mainstream media's behavior and performance by their corporate character and integration into the political economy of the dominant economic system. For this reason, we focused heavily on the rise in scale of media enterprise, the media's gradual centralization and concentration, the growth of media conglomerates that control many different kinds of media (motion picture studios, TV networks, cable channels, magazines, and book publishing houses) and the spread of the media across borders in a globalization process. We also noted the gradual displacement of family control by professional managers serving a wider array of owners and more closely subject to market discipline." In short this is the situation of US media in the sense of propaganda model. So, how many people control this enormous mechanism?

"Of the nine giants that now dominate the media universe, all but General Electric have extensively conglomerated within the media, and are important in both producing content and distributing it. Four of them – Disney, AOL Time Warner, Viacom, and News Corporation-produce movies, books, magazines, newspapers, TV programs, music, videos, toys, and theme parks, among other things; and they have extensive distribution

facilities via broadcasting and cable ownership, retail stores, and movie-theater chains. They also provide news and occasional investigative reports and documentaries that address political issues, but the leaders of these pop-cultural behemoths are mainly interested in entertainment, which produces large audience with show like ABC TV's Who Wants to Be a Millionaire and CBS-TV'S Survivor, or with movies like Disney's Lion King that also make possible the cross-selling "synergies" that are a focal point of their attention and resources."

Significant branches of media such as film and books have had extensive global markets for years; but it took twenty years for the national media systems and a global media system having distinctive influences on culture and politics to form.

In other words; the rapid growth of the New World Order which started with the 1978 Washington Agreement, global open market, correlatively global advertising and film industry; advance communication technologies which make the control over transnational operations easier; and the reinforcement of neoliberal ideology with the control of the nation-states over government policies all accelerated the process. "The United States and other Western governments have pressed the interest of their home-country firms eager to expand abroad, and the International Monetary Fund (IMF) and World Bank have done the same, striving with considerable success to enlarge transnational corporate access to media markets across the globe. Neoliberal ideology has provided the intellectual rationale for policies that have opened up the ownership of broadcasting stations and cable and satellite systems to private transnational investors."

If we look at today's communities, we can see that a neurotic structure is dominant. The seemingly liberal, democratically discoursed governments of neoliberalism seem to be democratic. "Because, their desires and motives that prove the opposite exist somewhere undiscoverable in their unconscious. There is not an exterior, concrete oppression which can make the society's unconscious discoverable or mischief behind the neoliberal power. In this modern society, thus, which ignores the invisible and is used to visuality; there is very little consciousness that moves behind the screen and tries to resist negations seeing the broader social frame."

The psychological improvement of the collective depression that occurs as a result of economic crisis forms with the corporations that take place in cultural industry. The reason is that cultural activities are, in some way or another, the ways people express their existence and share it. And it is quite important where the messages given lead the society to. For this reason, the most important characteristic of cultural industry corporations is that they control masses through leisure cultural activities and influence their ways of thinking. Our unconscious is related to our taught behaviors and survival experiences. Especially in the editing of Hollywood production films and their scenarios, certain scenes related to the desired mood in the individuals exist. The scenario and technique of the film creates a certain mood not only on the unconscious, but also the conscious level. This mood, which leads to pleasure sensations such as love and sex that create fear and anxiety like violence and death, prepares a mental base for the actual message beforehand. This forms a basis and mood for unconscious messages which appear towards the end of the movies more, and increases its affectivity.

It is important for the messages of the Hollywood movies to be influential to prompt the masses who want to escape from reality by fantasizing its ideology, and to simplify the message to a language which can be understood and shared by everyone by stereotyping individuals. "Because Hollywood can affectively express its message by keeping its simplicity to keep the society's pulse and choosing the subjects in accordance with everyone's interests. The control is gained with the usage of neoliberal capitalism as a tool of oppression upon societies' cultural dynamics with a sense of fear, and Hollywood makes this fear expand to the entire globe with the same message it transmits the entire world."

The prototype individual model of neoliberalism is an individual which belongs to "a contemporary society whose values are based on a competitor, acquisitionist and intense alienation which relies on a fetishized sight rather than substance for its own existence."

The mass media, especially Hollywood serves as a system which transmits the messages and symbols to common people. Entertaining, amusing, informing, setting the values, beliefs and behavior codes which ties individuals to the societies in conscious and unconscious are just a few of its functions. In a world in which prosperity and capital are in certain hands and which obtains important beneficial conflicts; performing this role requires a systematic propaganda.

In many countries which keeps hold of power balances in state bureaucracy, the monopolist control over media which is mostly completed by censorship clearly exhibits that media serves a certain group elites. In the places in which media is in private hands and there is no official censorship, it is more difficult to see a functioning propaganda system. … Propaganda model focuses upon the inequality of wealth and power and its multidimensional influence on mass media's benefits and choices.

Hollywood centered American film industry, which is a part of the media sector, has achieved a significant success in its aim of creating a global prototype with its operations directed to visual and unconscious level. The most important point here is that the personality has to fit in to certain stereotypes and approaches created by modernity, and thus it departs from selfness/naturalness by alienation. This alienation leads to the rush of the modern individual to find self and his/her escape from the reality of the world s/he belongs to. If we analyze this

situation from the aspect of cinema, especially Hollywood cinema, we can see that neoliberal capitalism forms a horror cinema, a simulation of real fear as a reminder to ensure the other intimidation mechanisms' continuity, and it claims that it does it with the purpose of entertainment. This simulation it forms becomes one of the most important shelters of the modern individual who wants to escape from reality. The fact that horror cinema, especially Hollywood productions is a mechanism, a propaganda tool which works for the intimidation policies is easily hidden behind the charming cover which is embellished with visual effects. Here, discourse and context are very important. The entertainment sector, which seems to be the least harmful element of the cultural industry, uses Hollywood cinema's power of exhibition, skill of expressing directly to transform and pacify masses. The Hollywood production horror films threaten the mass who watch them to avoid from the impacts of economic/financial crisis with a scarier, superior secret power. When the spectacles are threatened with the existence of this power, they think that they are only entertaining, it is only a movie, rather than they are under threat. Meanwhile, the messages that they want to transport into each spectacle's unconscious are successively conveyed. Fear narrows the unpredictability limits of both the individual's and masses'. Hereby the resistance of the ones who are to resist against inequality, injustice, inequity is weakened both spiritually and materially because the sense of anxiety that the horror movies create has weakened the strong beliefs of hearts and the courage of the individuals. In this respect, the most alarming side of this anxiety series which is placed in human unconscious by Hollywood production horror movies is that the things people know and see in daily life suddenly become different and unfamiliar. Thanks to this sense of alienation and unfamiliarity another secret is added to the regular things and this situation is the subliminal influence which forms the threat itself.

According to the researches not only the voting rate of the liberal parties increased after the economic crisis, but the number and popularity of horror movies also increased. In many Hollywood productions, the messages such as loyalty to authority, salvation, post-apocalyptic heaven to protect people from economic crisis or anything that pose danger are transmitted with gradually increasing dose. Actually economic/financial crisis has no difference from a horror movie in terms of the anxiety it creates in individuals and masses. The picture after the crisis has become literally threat at home. Now we are together with a zombie from the horror movies which we carry in our pockets, and which exploits our existence and family. We are face to face with this monster which sucks our blood like a vampire. Such influences that lead to anxiety series and deepen them cause depression in individuals. And depression led to the uncommon extension of usage of Prozac or other anti-depressants. Hence, according to the Republic of Turkey Ministry of Health and Turkish Doctors' Union's reports, in 2012, 37 million boxes of anti-depressant have been used in Turkey.

The statistical data show that there is a clear increase in the Hollywood production horror films after the years of economic crisis, which strengthens the claim that economic crisis and Hollywood films are in relation. famous Cabbalist pop singer Madonna says in her song named Hollywood: "I lost my memory in Hollywood / I've had a million visions, bad and good/There's something in the air in Hollywood/I tried to leave it but I never could" Another celebrity Marilyn Monroe also says that "Hollywood is a place which gives two million dollars for your kiss while two dollars for your soul."

Screen Reality: this significant concept can be assumed as a virtual reality which cannot be separated from object reality like in Baudrillard's Simulacra, and can replace it. The sensation we get with our five senses from the outer world leaves its place to the virtual reality we get from screens every single day. Think about the time we waste in front of computers, cell phones, monitors! How much did the time we spend in front of screens increase compared to five or ten years ago?

The beginning of disaster films which is a new genre launched especially in 1970s coincides with the period that WASPs and Jews began unfreezing. Now, Hollywood cinema has started elaborately to handle the theories about the end of the world. With the period of 1968, the annual rate of horror film production has doubled in Hollywood; and after the year 2000 this rate has tripled. While in 1970 the number of horror films directed in Hollywood is only 13, in 1980 it was 40, in 1990 it was 72, in 2000 it was 71, in 2005 it was 181 and in 2009 it was 745. What was unnatural and inhumane after the horror films and economic crisis process is that they manipulate people's worries and exploit their emotions by playing with their unconscious through cinema which is one of the mass media tools used by the global free market ideology to make the sufferings forgotten. The result of this manipulation is the silence of the masses. The horror films that feed neurotic fear also trigger learned helplessness. In other words the depression nourished by learned helplessness is a daily mood nourished by neurotic fear because neurotic fear occurs when one suffers the consequences of what they do and cannot change them, and it leads to a lack of desire for struggle against life by breaking individuals' resistance dynamics. Learned helplessness, on the other hand, occurs when the depressed individual learns the fact that despite their struggles nothing will change, and they can never control anything.

In the Hollywood product horror movies, there is a lot of emphasis on individual remorse. This kind of emphasis is the deep message in the subtext which leads us to simplify the reasons and results of the economic/financial crisis to individual level, and to look for the reasons of all the social issues in the individuals. Actually this is what the elites, who build the neoliberal apocalyptic utopia, want. It is not the system. Some people getting out of this system have caused this disaster. A scapegoat is to be created and victimized. The

failure of humanity and honor caused by the economic crisis with the loss of such elements as employment, money or life insurance becomes an exemplary fact which results from the fact that characters in horror films are shown to be defecated from mind and reduced to instincts, with the disparagement of the uncivilized human life who has been purified from social values. While Hollywood's traditional scenarios are always on similar themes, it uses certain elements for certain missions. In Hollywood, every message has an aim. None of the films has only the aim of entertainment.

Some of the science fiction horror and horror films, which are, also, the source of inspiration are The Excorsit (1973), Armageddon (1998), Blade Runner or Do Androids Dream Electric Sheep (1982), Minority Report (2002) and The Ruins (2008). Of course there are hundreds of others, as well because Hollywood owns a quite generous production list on this issue. After all, the claim that Hollywood cinema is the biggest weapon of the global free market secular religion of neoliberal capitalism's policy to make world a "World Company" should not be assumed as an exaggeration.

The fact that subliminal messages have more influence in a shorter course is related with the perceptual process. Throughout the perception, the reaction one gives to the perceptions does not include only that exact moment (during which the message is transmitted). It is also in relation with past experiences and other data in one's memory. The perceptual process is oriented at the whole on the conscious level, and it can apprehend the details only in the subconscious level. The unconscious message is organized in detailed pieces so as not to be realized by conscious level. Hollywood claims with the messages transmitted through the horror movies following the economic crisis that there is a crisis; an enormous nightmare about those who get hokey against the injustice after the economic crisis and those who get out of herd acceptance. Cinema uses entertainment rather than force as a compromise and socialization strategy. This situation, the distance of entertainment from strictures covers up a lot of issues; makes the cinema-film industry one of the most dangerous mass conversion tool. The fact that the horror elements of culture are entertaining, which is legitimized under the roof of entertainment concept, is based on an invisible strategic policy which works more influentially than other psychological operation corporations. At this point a global change occurs, especially Hollywood cinema becomes superior then other psychological war corporations at influencing human unconscious as it changes people's living rhythms and rituals in accordance with the system's desire by organizing people's spare times. A movie, as an experience, narcotizes people's conscious, and restrain them to their unconscious instincts and primary intuitions. The person besieged with huge display and loud sounds in the darkness experiences more than only watching a movie in a cinema hall because a movie lets neither time nor space for the spectacle to think and resist as it evokes both eyes and ears.

Pagan, the global free market utopia of neoliberalism, legitimizes secular political ideology, which is fed by judeo-Christian beliefs using the best film industry, and creates newer elements of anxiety by narcotizing mass mind. Now, there is no more rational capitalism. The invisible hand of capitalism, also, is the globalized, elitist and monopolist financial capital which orders the world by growing enormously. The human logic to criticize and question the system and corporations is narcotized by Hollywood cinema. Although in the Quran, the sacred book of Islam, there are 700 verses meaning "Don't you ask your minds?", it is unfortunately obvious that humanity does not have a self control. So, it should not be assumed as an exaggeration that the biggest manipulation element is the subliminal operations practiced by Hollywood products.

## 3   Conclusion: Awakening Minds to Recover from Instability

"Today elected governments run the majority of states in the world. The majority of CEOs of the biggest banks and international corporations are those who are the best and the brightest – the ones who have graduated with merit from the world's leading universities. Today citizens are better educated, better informed, their rights are better protected and they are more empowered to resist the authority of the state than ever before. Both the political and business elites are more diverse than ever in their ethnic, gender, race and class makeup, while being better connected and much more homogeneous with regard to their cultural tastes and ideas about governance. But neither the rise of democracy, nor the rise of meritocrats have eased publics' growing anxiety that 'markets aren't working the way they are supposed to, for they are neither efficient, nor stable; that the political system hasn't corrected the market failures; and that the economic and political systems are fundamentally unfair.' … So why modern elites have no legitimacy and capacity to govern?" One of the most important corporations of these elites is the Bilderberg Conferences. Stephen Lendman writes: "The elites of Bilderberg is planning to set up a world which is not suitable to live in and they may destruct the whole world within this process in the final analysis. It is difficult to conceive a more evil-minded power than Bilderberg. The American members of Bilderberg Conference reveals the extent of things that this power may bring about with the worst example."

The humanity is brought face to face with a war, in a sense, more than seven billion people put on a target board has been destabilized with secret methods. In other words this is what the neoliberal global free market myth, which is the financialized version of capitalism has been doing for the last 30 years. To destabilize means

to call the financial operation masters for duty to destroy the social and economic structures of countries. The economic war is a kind of a dirty war which the elite fathers controlling the financial environment of the globe love. Although they are no less fatal than the atomic bombs or bombarded Nagasaki, Dresden or Baghdad; they are more easily sold to today's humanity who are narcotized by Hollywood films.

# The Relationship between Nominal Exchange Rate and Sectoral Output: An Emprical Analysis

Prof. Dr. Ahmet Ay (Selçuk University, Turkey)

Asst. Prof. Dr. Şerife Özşahin (Necmettin Erbakan University, Turkey)

Ph.D. Candidate Mustafa Gerçeker (Selçuk University, Turkey)

## Abstract

In this study, it is investigated the existence of the long term relationship between nominal exchange rate and sectoral output for seven different sectors in Turkey by using control variables including money supply, total public expenditure, oil price and unemployment rate. For this purpose, possible relations are tried to be determined by using bound test and ARDL method for the period 1998 Q1-2011 Q3 with quarterly data. As a result of the bound test, it is achieved that there is a long term relationship in all sectors excluding construction. Based on this finding, it is estimated the long term coefficients and equations for the six sectors. These long term coefficients indicate that the rise in the TL/dollar nominal exchange rate affects sectoral output negatively in all sectors excluding finance because of the cost effects of imported input usage.

## 1 Introduction

By collapsing of Bretton Woods system in 1973, many countries –especially developed countries started to use floating exchange rate instead of fix exchange rate. Since this transition process cause serious fluctuation in exchange rate and trigger the economic uncertainties, it directed policy makers and researchers to investigate the effect of these fluctuations on the trade volume and production balance (Köse et al., 2008:26).

It is accepted that the devaluation that means depreciation of a currency or depreciating it by an administrative decision, will make cheaper the countries' exported products in terms of foreign currency and provide competitive advantage in export (Krugman and Taylor, 1978:445). The findings of many empirical studies about this subject show that, making a definite inference about the effect of decrease in nominal value on domestic production volume is not possible and that this interaction can be both positive and negative. In this respect, it is argued that the final effect on the domestic production volume will depend on the total demand and total supply curves' reaction to the decrease in value. If depreciation increases the total demand (due to the increase in net export) more than the decrease in total supply (due to the increase in the cost of imported inputs), it can be said that there will be an expansionist effect (Bahmani-Oskoee and Mirzaie, 2000: 51).

Clearly, that the foreign goods become more expensive as a result of depreciation of national currency, reduce the consumer demands for the imported goods and increase the demands for domestic products. In addition, it increases the demand for exported goods which become relatively cheaper. Furthermore, that the foreigners shift their expenditures to the imported goods which are cheaper than their domestic goods increase the export in the other foreign trade partner country, whose import decreases. It provides an improvement in current account balance of the country and then it makes an expansionist effect in all economy (Krugman and Obstfeld, 2000: 444-445). On the other hand, in the literature there are also other statement about that devaluations can be contractionary, in other words, changing in real exchange rate can have negative effects on the output volume. According to the studies about this statement, nominal devaluations' negative real balance effect cause decrease in real output by repressing the total demand and output level, due to the high price level (Edwards, 1986: 501). Krugman and Taylor (1978) states that devaluations can cause negative effects on output volume since both import and export are not sensitive to the changes in price in the short-run. Also, in the short-run when nominal wages are solid, increase in import of intermediate good cause redistribution of total revenue against the workers. In the case of that the national currency appreciates or revaluates, contrary interpretation can be made.

There are studies about the effects of changes in nominal exchange rate on the total production of country and sectoral output volume on the basis of sub-sectors. In this study, it is aimed to empirically examine the effects of changes in nominal exchange rates on the sectoral production volume with econometric methods by utilizing the methodology of Bahmani-Oskoee and Mirzaie's (2000) study on USA economy.

## 2 Literature

Although there are lots of studies about the effect of depreciation or appreciation on the total output level, it is seen that in both domestic and foreign literature there is not enough study about the exchange rate volatility effects especially on the sectoral base. In this respect, the limited number of studies on the relationship between the exchange rate and sectoral output level and the studies about the relationship between changes in exchange rates and total output can be summarized as follows.

Bahmani–Oskoee and Mirzae (2000) examined the long termed relationship between production volume and dollar value in eight different sectors of US economy with co- integration method. In the study, the sectors of "agriculture, forestry, fishery"; "manufacturing"; "wholesale"; "retailing"; "finance, insurance and real estate"; "service"; "mining"; and "building" were considered. Even though the findings of Joahnsen co-integration test point out that there is one co–integration vector in each sector, co-integration relationship could not be identified due to the emergence of crowding out in many sectors and the relation between sectorial output and effective exchange rates.

Agenor (1991) studied the effect of real exchange rates on the output with the data of 23 countries for the period of 1978-1987. Empirical analysis is based on total output equation with the imported intermediate goods, derived from macro model of rational expectation. The findings of analysis reveal that the expected depreciations in the exchange rates have a negative effect on the economic activity, while the unexpected depreciations have a positive effect on the output.

Branson and Love (1986), examined the effect of fluctuations in the exchange rate on the output of manufacturing industry and the employment volume. They concluded that the fluctuations of exchange rate have significant effects on the output volume of manufacturing industry. According to this finding, depreciation of dollar has an expansionary effect on the production volume in a number of sectors.

Gylfason and Schmid (1983) studied the effects of %10 devaluation on the real output for 10 countries including US. The prediction coefficients of the parameters and flexibility values show that the devaluation increases the volume of real output in US economy.

Ibrahim (2007) analyzed the relationship between real effective exchange rates and total output volume and the output level of eight sub-sectors for Malaysia with a method similar to the study of Bahmani-Oskoee and Mirzae (2000). In the study, multivariable co-integration analysis was applied and it was found that there is a co-integration relationship between both the volume of total output and all sectors and real effective exchange rate.

Kandil and Mirzae (2000) examined the relationship between the exchange rate fluctuations and economic activities through the example of US. As a result of the study, by taking into consideration both supply and demand aspect of variations in the exchange rate, they showed that the exchange rate variations have a minimal effect on the industrial production.

Masunda (2011) examined the effects of deviation in exchange rate on the agriculture, manufacturing, and mining sectors for Zimbabwe. As a result of econometric analysis, it was concluded that the imbalances in the real exchange rate have a negative effect on the production volume. Another important result of the study is that overvaluation in exchange rate has a negative effect on the production volume of the sectors under consideration.

Aguirre and Calderon (2005) analyzed the effects of the deviation and volatility in exchange rates on the economic growth for 60 countries by using panel data method with the data including the period of 1965 -2003. According to the findings, although that incomplete valuation is at high levels affects growth negatively, incomplete valuation at reasonable levels affects the growth positively. In other words, economic growth is affected negatively from the real exchange rates at high level volatility and deviation.

Toulaboe (2000), analyzed what way the deviations in exchange rate affect economic growth rates of the developing countries and used the data per capita GDP growth rate and deviation in exchange rate of 33 developing countries. The results show that the deviations in the real exchange rate have negative correlation with the economic growth.

İşcan (1997), with the data including the years of 1978 -1991, examined the effect of nominal devaluation on the real output of nine different sectors of Mexican economy. In the study, the sectors of agriculture, fishery, and forestry; manufacturing; mining; building; financing; and insurance; service, transportation and communication; hotel and restaurant; and electric and energy were considered. According to the findings of the study, it was identified that devaluation had contractionary effect in the short run for the sectors except agricultural sector.

Sarı (2009), in the sample of Turkey, with the monthly data including the period of 1986:10–2006:01, examined the effects of the increases in the exchange rate volatility, interest rates, and money supply on the total output. The findings of the study show that in Turkey, manufacturing sector was affected from the exchange rate volatility rather than interest volatility. According to this statement, the uncertainty in the exchange rate negatively affects the amount of sectorial production volume through import and export.

Ay et al. (2008) examined the causality relationship between the real exchange rate and output volume in Turkish economy with the quarterly data belonging to the period of 1990: Q1 – 2006: Q3. In the study, the real GDP variables for the output level and the real effective exchange rate variable for the exchange rate were used. Based on the empirical analysis result, in Turkey, it was suggested that the real exchange rate had positive effects on the output volume.

Çatık (2007) studied, in the sample of Turkish economy, the effect of the variations in real exchange rate on the economic growth, using Granger causality test, variance decomposition and cause-effect analyses. According

to the findings of the study, since the real exchange rate kept below the balance value in Turkey, it can be said that the real exchange rate decreases the output volume in the long-run.

Uğurlu (2009) examined the relationship between the real exchange rate and the economic growth in Turkey, by establishing two different models. According to the results of Granger causality test, applied in the study, it was concluded that real exchange rate Granger cause GDP. The results of cause-effect and variance decomposition analysis suggested that the increases in the real exchange rate had an increasing effect on GDP in the short term, but this had a reducing effect in the long term.

## 3　Data Set and Econometric Model

In this study, the relationship between the sectorial output level and TL/USD nominal effective exchange rate is attempted to be determined with model used in the study of Bahmani-Oskooee and Mirzaie (2000) and expressed in Equation 1.

$$Q_{it} = F[UN_t, OILP_t, G_t, M_t, EX_t] \tag{1}$$

$Q_{it}$ that is present in Equation 1 represents the level of total output for each sector, $UN_t$ the rate of unemployment, $OILP_t$ oil prices, $G_t$ public expenditure, $M_t$ the real M2 money supply, and $EX_t$ nominal effective exchange rate in dollar. In addition econometric analyses were conducted through 7 different models, according to that each level of output is accepted as a dependent variable. For this purpose, the sectorial definitions used can be explained as follows:

$Q_1$: Total output of agriculture, forestry, and fishery sector

$Q_2$: Total output volume of manufacturing sector

$Q_3$: Total output volume of transporting sector

$Q_4$: Total output of building sector

$Q_5$: Total output of financial and fiscal sector

$Q_6$: Total output volume of service sector

$Q_7$: Total output level of mining sector

According to Bahmani-Oskooee and Mirzaie (2000), the variable $UN_t$ included in the model so that it represents business circle, is expected to be negative due to the fact that the increase in unemployment rate causes the decrease in the total demand and at the production level of each sector. In addition, since increase in oil prices will increase the production cost in each sector, it causes consumers to pay for higher price. Hence, since the rise in oil price is a factor affecting the sectorial output level negatively, it is expected that the variable $OILP_t$ also have negative sign. In case that the fiscal and monetary policies create an expansionary effect on the sectorial demand, the coefficients of the variables $G_t$ and $M_t$ are positive signed, otherwise, negative signed. In case that the rise in the exchange rate creates an expansionary effect on the sectorial output volume, the variable $EX_t$ representing the nominal effective exchange rate has a negative signed coefficient, while in case that this sign is positive, it can be said that the contractionary effects of the variations in exchange rate are more dominant.

In the study, the quarterly data belonging to the period of 1998.Q1-2011.Q3 is used in modeling by making their logarithmic transformations and the package program Eviews 6.1 is used for econometric analysis. Total output levels for each sector, nominal effective exchange rate, M2 real money supply, and time series of the public expenditures were compiled from Electronic Data Distribution system in the official internet page of TR Central Bank. In addition, the values associated with the unemployment rates were drawn from the database of Turkish Statistical Institute, while oil prices from that of State Planning Organization.

## 4　Methodology

Granger and Newbold (1974) mention about that the predicted model by using non-stationary time series will be spurious regressions and that the coefficients and signs achieved from these models will not reflect the real relationship. Hence, in all analyses using time series, stationarity test has a great importance. For this purpose, in order to test the presence or stationarity of possible unit roots in series, a number of method was developed, but among the frequently used method in the literature, ADF and PP tests draw attention.

### 4.1　Unit Root Tests

In ADF test developed by Dickey and Fuller (1981), three different regression are predicted according to the cases of that the data are constant, constant trend and non-constant. The models to be predicted in applying ADF test are expressed in Equations 2, 3, and 4.

$$\Delta Y_t = \delta Y_{t-1} + \sum_{i=1}^{m} \alpha_i Y_{t-i} + u_t \tag{2}$$

$$\Delta Y_t = \beta_1 + \delta Y_{t-1} + \sum_{i=1}^{m} \alpha_i Y_{t-i} + u_t \tag{3}$$

$$\Delta Y_t = \beta_1 + \beta_2 t + \delta Y_{t-1} + \sum_{i=1}^{m} \alpha_i Y_{t-i} + u_t \tag{4}$$

$u_t$ that is present in the equations represents the error correction term, while $Y_{t-1}$ represents the lagged value of one period of the dependent variable. In ADF test, the presence of unit root is tested with that δ equals to 0 and a decision is given by comparing these values calculated to the critical MacKinnon values (Gujarati, 2004: 817). In the stage of decision, accepting the alternative hypothesis by rejecting the null hypothesis, in other words, the calculated value should be smaller than the value of critical table for the series to be stationary.

Unit root tests of Phillips and Perron, as a method settling that the error terms from the regression equation are related to each other and the problem of the varying variance was developed by Phillips and Perron. This method can be explained by Equation 5 (Zivot and Wang, 2006:127).

$$\Delta y_t = \beta' D_t + \pi y_{t-1} + u_t \tag{5}$$

The fact that the error term $(u_t)$ in Equation 5 includes unit root and the problem of possible varying variance is eliminated by correcting test statistics $t_{\pi=0}$ and $T\hat{\pi}$ in this method. It is decided whether or not the series is stationary, by comparing the calculated value to the critical value, just as in ADF test. That the calculated value is much smaller than the critical value, shows that the series do not include unit root also in PP test, in other words, that it is stationary.

### 4.2 Bound Test and ARDL Method

Engle and Granger (1987) and Johansen and Juselius (1990) co-integration tests emerged for testing the presence of inter –variables long termed relationships. These tests necessitate the stationarity at the same level in the series which the long termed relationship will be researched within, and these methods are not used in the case where this condition is not fulfilled. Bound test and ARDL method is the best in case that the series is stationary at the different level.

In bound test developed by Pesaran et al. (2001), first of all, presence of inter –series long termed relationship is researched. If the results of bound test point out a finding that there is a relationship, the short termed coefficients are achieved from ARDL method developed by Pesaran and Shin (1999). In this study, in order to research the effect of variations in the exchange rate on the sectorial output, it is used the methodology in the study of Bahmani-Oskooee and Mirzaie (2000). For this purpose, the regression equation to be predicted can be expressed as follows:

$$Q_t = \beta_0 + \beta_1 UN_t + \beta_2 OILP + \beta_3 G_t + \beta_4 M_t + \beta_5 EX_t + \varepsilon_t \tag{6}$$

In bound test, developed by Pesaran et al., (2001), an unlimited error correction model, aligned according to the dependent variable, is predicted. According to the levels of sectorial output, the dependent variable of this study, the unlimited conditioned error correction model is shown in Equation 7.

$$\Delta Q_t = c_0 + c_1 t + \delta_1 Q_{t-1} + \delta_2 UN_{t-1} + \delta_3 OILP_{t-1} + \delta_4 G_{t-1} + \delta_5 M_{t-1}$$

$$+ \delta_6 EX_{t-1} + \sum_{i=1}^{p} \lambda_i \Delta Q_{t-i} + \sum_{i=0}^{p} \omega_i \Delta UN_{t-i} + \sum_{i=0}^{p} \varphi_i \Delta OILP_{t-i} \tag{7}$$

$$+ \sum_{i=0}^{p} \gamma_i \Delta G_{t-i} + \sum_{i=0}^{p} \theta_i \Delta M_{t-i} + \sum_{i=0}^{p} \eta_i \Delta EX_{t-i} + u_t$$

$c_0$ in Equation 7 represents the constant term; Δ, the first difference of the variables; and $_1$, $\delta_2$, $\delta_3$, $\delta_4$, $\delta_5$ and $\delta_6$, long termed coefficients of the variables. In the first stage of bound test, the equation in Equation 7 is predicted with the lag lengths suggested by p lag values Akaike (AIC) and Schwarz (SBC) information criteria. In determining the lag length, it is very important that there is no autocorrelation problem with the models predicted by this lag length (Pesaran and Shin, 1999: 373, 386).

The presence of inter – variables long term relationship will be decided as a result of that F-statistical values of the predicted regressions are compared with the critical values given by Pesaran et al..(2001). F-critical statistics given by Pesaran et al. (2001) give two statistical values; lower and upper limits. In case that the calculated F-

value is bigger than critical upper limit of Pesaran et al. (2001), it can be said that there is along termed relationship (Pesaran et al., 2001: 290)

In the cases, where the findings of bound test point out the presence of long term relationship, the long and short termed regression equations will be achieved from ARDL method. The long term conditioned ARDL model, formed according to the appropriate lag length achieved at the stage of limit test is expressed in Equation 8.

$$Q_t = c_0 + \sum_{i=1}^{p_1} \alpha_i Q_{t-i} + \sum_{i=0}^{q_1} \theta_{1i} UN_{t-i} + \sum_{i=0}^{q_2} \theta_{2i} OILP_{t-i} + \sum_{i=0}^{q_3} \theta_{3i} G_{t-i}$$
$$+ \sum_{i=0}^{q_4} \theta_{4i} M_{t-i} + \sum_{i=0}^{q_5} \theta_{5i} EX_{t-i} + u_t \tag{8}$$

The equation of error correction model, in which the short termed coefficients of variables will be achieved, takes place in Equation 9.

$$\Delta Q_t = \mu + \sum_{i=1}^{p} \lambda_i \Delta Q_{t-i} + \sum_{i=0}^{p} \omega_i \Delta UN_{t-i} + \sum_{i=0}^{p} \varphi_i \Delta OILP_{t-i}$$
$$+ \sum_{i=0}^{p} \gamma_i \Delta G_{t-i} + \sum_{i=0}^{p} \theta_i M_{t-i} + \sum_{i=0}^{p} \eta_i EX_{t-i} + \vartheta ECM_{t-1} + u_t \tag{9}$$

The coefficients in front of each variable in Table 9 are the short termed coefficients of variables and the term $\vartheta$ represents the error correction coefficient of the model. For error correction model to run well, the error correction coefficient should be negative signed and statistically significant. In addition, for the reliability of short termed regression, it is necessary to apply Breusch-Godfrey autocorrelation test, Jarque-Bera normality test, and White varying variance test

## 5 Results of Analysis

In the methods of bound test and ARDL not requiring that the variables are stationary at the same level, even in the series having the stationarity at different level, the presence of long termed relationship can be tested. However, since these methods can be applied in case that the series is stationary in only first order differences, no series requires to be stationary its second order difference. In this study, to test the stationarity levels of series, it is used Expended Dickey-Fuller Unit Root Test (ADF), developed by Dickey and Fuller (1981), and Phillips-Perron (PP) unit root test by Phillips and Perron (1988). In Table 1, it is reported the results of ADF and PP unit root test of the original series that its logarithmic transformation is made.

***Table 1:*** *The results of ADF and PP Unit Root Test of the original series*

Table 1 reports the findings of ADF and PP tests in two different ways, constant and trended. When the results of ADF and PP tests were evaluated; it is seen that the stationarity levels belonging to the series differentiate according to the sort of test and according to that models are constant and trended. Whether or not the series not

turning out stationary at level is stationary in their first differences requires ADF and PP tests to be applied, taking the first differences of all series. In Table 2, the results of stationarity test of the series that its first difference is taken, are given place.

***Table 2:*** *The results of ADF and PP Unit Root Tests of the series that its first difference is taken*

When the findings in Table 2 are examined, it is seen that the series that is not stationary at the original level, becomes stationary in their first differences. Since it is seen that all series to be used in the econometric analysis are stationary at maximum first level; with a technical expression, that it is I(1), the presence of long term relationship can be tested.

To use the bound test for testing the presence of inter-variables long term relationships, Equation 7 should be predicted by an ordinary least squares method. In selection of suitable lag length stated as p in Equation 7, it is used generally the Akaike and Schwarz information criteria. In addition, in the model predicted with the lag length suggested by these information criteria, whether or not there is autocorrelation problem is controlled with Breusch-Pagan Lagrange multiplier (LM) and LM test results are summarized in Table 3.

| Models | With Deterministic Trend | | | | Without Deterministic Trend | | | |
|---|---|---|---|---|---|---|---|---|
| | p | AIC | SCH | LM(1) | p | AIC | SCH | LM(1) |
| Model 1 | 4 | 1.72 | 2.200 | 2.348(0.12) | 4 | 1.77 | 2.21 | 4.205(0.05) |
| Model 2 | 4 | -2.62 | -2.143 | 1.788(0.18) | 4 | -2.58 | -2.14 | 3.364(0.06) |
| Model 3 | 4 | -2.56 | -2.090 | 2.895(0.08) | 4 | -2.56 | -2.11 | 2.249(0.13) |
| Model 4 | 4 | -2.40 | -1.922 | 0.008(0.92) | 1 | -2.40 | -1.95 | 0.101(0.74) |
| Model 5 | 1 | -0.99 | -0.514 | 1.921(0.16) | 1 | -1.02 | -0.58 | 1.852(0.17) |
| Model 6 | 4 | -2.11 | -1.638 | 0.404(0.52) | 4 | -2.15 | -1.71 | 0.406(0.52) |
| Model 7 | 4 | -11.6 | -0.457 | 0.209(0.64) | 4 | -1.08 | -0.41 | 0.002(0.95) |

**Note**: p is the appropriate lag length, while the values in parenthesis probability values.

***Table 3:*** *Determination of appropriate lag length*

When the results in Table 3 are evaluated, it is seen that Akaike and Schwarz information criteria show the same lag length except for one model. The models predicted according to these lag length do not have autocorrelation problem according to Pagan Lagrange multiplication.

In Table 4, the results of bound test for trended and non –trended models take place. In bound test, in order to assign the presence of inter-series co-integration relationship, we need for the critical values given by Pesaran et al. (2001) and the calculated F-statistics. In case that the calculated F-statistics are bigger than the critical value given by Pesaran et al.(2001), it can be said that there is an inter-series long termed relationship and in this case, the null hypothesis will be rejected, the alternative hypothesis will be accepted. In Table 4, the results of limit test are given place.

| Dependent variable | Trended Model | | Non-trended Model | Result |
|---|---|---|---|---|
| | F-iv | F-v | F-iii | |
| Agriculture | 4.025 | 4.407 | 4.563 | There is co-integration |
| Manufacturing | 5.197 | 4.022 | 5.909 | There is co-integration |
| Wholesaling | 8.714 | 9.092 | 9.952 | There is co-integration |
| Building | 2.587 | 2.460 | 2.720 | There is no co-integration |
| Finance | 4.321 | 4.723 | 5.124 | There is co-integration |
| Service | 14.075 | 13.551 | 16.162 | There is co-integration |
| Pesaranet al.(2001) lower limit critical values | | | Pesaranet al.(2001) upper limit critical values | |
| %1 | -3.43 | | -4.79 | |
| %5 | -2.87 | | -4.19 | |
| %10 | -2.57 | | -3.86 | |

**Note**: Critical values are from the study of Pesaran et al.(2001)

*Table 4: F-statistics obtained from limit test and Critical values pertinent to Pesaranvd. (2001)*

When the findings in Table 4 are compared with the lower and upper values of Pesaranet.(2001), it is seen that the values calculated with the other models are bigger than critical upper limit, except for the model, in which the sectorial output level of the building sector is dependent variable. Hence, in these models it can be said that there is a long term relationship and it can be moved to ARDL model, in which the long and short term coefficients of series will be obtained.

The reason for why there is no long-run relationship in the building sector can be understood with examining the input-output tables. When the last input-output table, published by TÜİK in 2002, is examined, it is seen that the building sector use domestic intermediate input at high level and that the amount of import input remains at very low level (TÜİK, 2002). Hence, that the use of imported input remains at the very low level is the cause of no long run relationship between the sectorial output level and the variation in the exchange rates for the building sector.

In the method of ARDL, the suggestion of Akaike criterion is used as lag length. Any prediction was not made for the model where the building sector is dependent variable since there is no long term relationship between them. In Table 5, it is given the results of ARDL method which established to obtain coefficients for evaluating the relationships in other sectors.

*Table 5: ARDL Model Results and Long Term Co-efficient*

When the long-run coefficients given in Table 5 are examined, in the sectors except for the financial and mining sectors, it is seen that with the decrease of total demand for the relevant sectors, the unemployment rate reduces the level of sectorial output. In all models except for the Model 7, where mining sector is dependent variable, the unemployment rate is a statistically significant variable affecting the sectorial output. In addition, the rise in oil prices also does not create a negative effect in any sector on the sectorial output except for manufacturing industry, where oil prices are used as an input. According to the long term coefficients come from the results of regression, it can be said that the increase in the public expenditures has an expansionary effects on the sectorial output in all models except for "the constant model" of the finance sector. In "the constant model" giving the effect of public expenditures on the finance sector, this variable is not statistically significant. When these coefficients are evaluated in terms of monetary policy it can be said that the monetary policy applied mostly affects the sectorial output positively.

When the effect of the variations in the exchange rates on the sectorial output is examined, in all sectors except for the financial sectors, it is seen that the rises in the exchange rates have statistically significant effects at the

1% level on the sectorial output in the constant models, at the 5% level in the trended model. On the other hand, increase in the nominal exchange rate has contractionary effect on the sectorial output except for the financial sector. However, even if the effect of increase in the exchange rate on the output volume of the financial sector is expansionary, this effect is not statically significant.

This positive contractionary interaction between the nominal exchange rate and the sectorial output can be explained by levels of imported input used in the sectors. When the input- output table published by TÜİK is examined, it is seen that these contractionary effects on the sectorial output volume emerge through the import channel due to the import input used in all the relevant sectors. Since rising exchange rates requires more payment for imported inputs, the cost pressure creates the decreasing effects on the sectorial output level.

Furthermore, although many sectors in the scope of the manufacturing industry have foreign trade surplus, adapting to the new technologies in order to provide continuity in the productivity growth, make it necessary to renew for the firms in this sector and this situation also makes the import continuously (Küçükkiremitçi, 2011). In addition, according to the results of analysis, that depreciation of domestic currency as a result of increase in the real exchange rate makes the import more expensive also explains the positive contractionary interaction between the input level in the manufacturing industry and the real exchange rate.

When the results are evaluated in terms of the agricultural sector, due to the fact that the amount of intermediate input of the agricultural sector is low and that it depends on the weather conditions, it can be suggested that there is no statistically significant relationship between the level of agricultural output and the exchange rates. Also, in the results of analysis this situation can be explained with the fact that the level of nominal exchange rate is not a significant variable affecting the output level of agricultural sector.

The coefficients that explain the short-run relationships between the variables can be obtained with error correction model, established in the basis of ARDL equation and expressed in Equation 9. In Table 6, the findings of coefficient that give the short term relationships between the variables are presented.

***Table 6:*** *The results of ARDL model and error correction model and the short term coefficients*

The term ECM, the error correction coefficient, is negative signed and statistically significant, as expected. When the short term relationships between the exchange rate and the sectorial output are examined it is seen that it is not possible to make an interference supporting the long termed findings in all sectors except for the finance and mining sectors. This is because of the fact that the relationships between the first and second lags of series and the sectorial output have different signs. The short term relationships between the changes in the exchange rate and the sectorial output are statistically significant except for mining sector.

## 6 Conclusion

In this study, it is investigated the existence of the long term relationship between nominal exchange rate and sectoral output by using the methodology in Bahmani-Oskooeeand Mirzaie (2000). For this purpose, possible relations are analyzed by using bound test and ARDL method for the period 1998.Q1-2011Q3. For researching the presence of the relationship between nominal exchange rate and sectorial output volume, Turkish economy is evaluated in the basis of 7 sub–sectors including agriculture- forestry–fishery, manufacturing wholesale business, building, financial and fiscal agencies, service and mining. In this respect, first of all, ADF and PP unit root tests are applied for stationarity test. Then, in order to determine whether or not there is a long term relationship between the series, bound test is used and it is achieved that there are long term relationships in six sectors except for the building sector. The long term coefficients obtained from ARDL method, point out that increase in nominal exchange rate except for financial sector negatively affects the sectorial output level. In the sectors, especially in manufacturing industry, in which the use of sectorial input is intensive, increase of nominal exchange rate negatively affects the total output volume due to the cost effect it creates. However, even if this interaction in the agricultural sector, where the output level depends on the weather conditions and the mining sector, where the use of imported input remains at very low level is negative, it is not statistically significant.

# The Exchange Rate Volatility in Indonesia and Policy Response

Ph.D. Candidate Ferry Syarifuddin (Bank Indonesia, Indonesia)

## Abstract

High fluctuation of exchange rate in short horizon is obviously making economic activity more risky as uncertainty rises. Moreover, volatile exchange rates also make commodity prices, interest rates and a host of other variables more volatile as well. Although changes in long-run exchange rates tend to undergo relatively gradual shifts, in the shorter horizon, the exchange rate might be very volatile. Then there should be a systematic and measured policy to mitigate the foreign exchange fluctuations and to minimize the fluctuations as well as to drive it to its fundamental value. In this part, USD/IDR volatility is investigated using GARCH approach. The results reveal that, USD/IDR volatility in Indonesia is persistent. On the other hand, the following studies also present the outcomes of effectiveness of policy response by the Central Bank. Foreign-exchange sale interventions by the Central Bank lead conditional volatility of the USD/IDR to decrease slightly.

## 1 Introduction

One of consequences adopting floating exchange rate, many countries face often widely fluctuation of their exchange rate as capital flows freely coming in or out the countries. Freely floating exchange rate will be needed by independent monetary authority to conduct independent monetary policy. However, many countries usually reluctant to allow their currencies to fluctuate (e.g. Calvo and Reinhart 2000), because of the potential for sharp exchange-rate movements to exacerbate inflationary pressures and financial sector vulnerabilities.

The Bretton Woods exchange rate system fail has led to significant fluctuation in both real and nominal exchange rates. The liberalization of capital flows and the associated intensification of cross-border financial transactions also appear to have amplified the volatility of exchange rates and the misalignment movement of exchange rate from its fundamental value.

Some factors that cause the supply and demand of foreign exchange include market fundamentals (economic variables) such as inflation rates, productivity, real interest rates, consumer preference, government trade policy, and market expectations such as news about future market fundamentals and traders' opinion about future exchange rates. In the short run, foreign-exchange transactions are dominated by transfers of assets (bank accounts, government securities) that respond to differences in real interest rates and to shifting expectations of future exchange rates. Over the medium run, exchange rates are governed by cyclical factors such as cyclical fluctuations in economic activity. Over the long-run, foreign-exchange transactions are dominated by flows of goods, services, and investment capital, which respond to forces such as inflations rates, investment profitability, consumer tastes, productivity, and government trade policy (Carbaugh, 2013).

Foreign exchange rates can move in opposite direction from that indicated by longer-term fundamentals in the short run. This phenomenon exists mainly driven by heterogeneous foreign-exchange expectations by the foreign-exchange player. Besides, the free foreign exchange market mechanism and foreign-exchange system play main role in the dynamics of the foreign-exchange rates. Although today's exchange rate may be out of line with long-term fundamentals, this should not be construed as implying that is necessary inconsistent with short-term determinants – for example, interest rate differentials, which are among the relevant fundamentals at the short end of the time dimension.

Indonesia is among of countries that adapts free floating exchange rate regime. By freely floating exchange rate and position as small open economy, Indonesia' exchange rate movements are strongly influenced by capital flows and net export's proceed. Hence, existence of central bank optimal monetary response (i.e. foreign exchange intervention) needed to drive the exchange rate for the long-term equilibrium exchange rate as well as to maintain its stability. Within the last 3 years, the IDR performed worse even though experienced mild volatility among regional economies. Even though, IDR experienced highest depreciation among regional economies caused by deteriorating current account and fiscal balance.

Since Indonesia has been adopting a floating exchange rate regime in the wake of the 1997 economic crisis, the value of the rupiah continues to be volatile and determined by fundamental and non-fundamental forces. Exchange rate is determined by supply and demand of foreign exchange in a free foreign exchange market that cause exchange rate fluctuate to appreciate or depreciate. Exchange rate volatility can have a negative effect on economy mainly through international trade and capital flows, directly through uncertainty and adjustment costs, and indirectly through its effect on the allocation of resources and government policies. If exchange rate movements are not fully anticipated, an increase in exchange rate volatility may lead risk-averse agents to reduce their international trading activities (Chit, 2010).

Therefore, it appears that the central bank has been prepared to intervene in order to prevent sharp currency movements in both directions, while buying/selling foreign exchange on a more sustained basis in an attempt to stabilize domestic price as well as to foster export competitiveness through the maintenance of a low, stable

exchange rate. In some instances the Indonesian authorities have openly acknowledged their role in managing the exchange rate, particularly when intervening to support the currency in periods of sharp depreciation. In these cases intervention often appears to be carried out under the pretext of "keeping volatility in check". Indeed, it seems to be widely accepted that intervention is a valid policy tool, which can be used, "possibly in conjunction with monetary policy, to stabilize market expectations, calm disorderly market, and limit unwarranted short term exchange rate movements because of temporary shocks" (Warjiyo 2005). The role in maintaining exchange rate stability is also as a reflection of Bank Indonesia awareness of public pressure to manage the exchange rate at an appreciated level which support the desired inflation target. Economic agents monitor exchange-rate development every day and hope stable exchange rate overtime. Therefore, it is crucial for the central bank to fulfill the public's desire and this success in maintaining exchange-rate stability may be regarded by some policy-makers as a key indicator of central bank performance.

Primary source for measuring the volatility of an exchange rate, distribution of exchange rate data, has important implications for several financial models and is characterized by mild and volatile periods. Two proposed processes, autoregressive conditional heteroscedasticity (ARCH) by Engle (1982) and general autoregressive conditional heteroscedasticity (GARCH) by Bollerslev (1986) have been shown to provide a good fit for many exchange rate series in the literature, allowing volatility shocks to persist over time by imposing autoregressive structure on the conditional variance. This persistence is consistent with periods of relative volatility and tranquility in returns and it is employed to explain the non-normalities in exchange rate series.

Therefore, it is crucial to observe and interpret the underlying reasons for volatility as well as measuring it. Utilizing ARCH/GARCH models, this study tries to measure and explain the volatility in the USD/IDR exchange rate level. Primary source for measuring the volatility of an exchange rate has important implications for several financial models and is characterized by mild and volatile periods.

## 2   The Volatility of Financial Time Series Data: The Theory and Empirical Evidences

Financial time series are often available at a higher frequency than macroeconomic time series and have been shown to exhibit the presence of statistically significant correlations between observations that are a large distance apart. Another distinguishing feature of many financial time series is time-varying volatility or "heteroscedasticity" of the data.

When discussing the volatility of time series, econometricians refer to the conditional variance of the data, and the time-varying volatility typical asset returns are otherwise known as conditional heteroscedasticity. The concept of conditional heteroscedasticity is introduced to economists by Engle (1982), who proposes a model in which the conditional variance of a time series is a function of past shocks; the autoregressive conditional heteroscedasticity (ARCH) model.

### 2.1 Measuring Volatility: ARCH/GARCH Model

In this part of the study, the stylized facts concerning the properties of financial time series are examined and the ARCH family models, which can capture periods of turbulence and tranquility, are investigated. One aspect to elaborate in this study is presenting the review of empirical findings that are attained by employing GARCH models on exchange rate series. GARCH is often used in quantitative financial research, where a trader predicts this period's by forming a weighted average of a long term average (the constant term), from information about the volatility observed in the previous period (the ARCH term), and the forecasted variance from the last period (the GARCH term). This model is also consistent with the volatility clustering often seen financial returns data, where large changes in returns are likely to be followed by further large changes.

The concept of ARCH disturbances was introduced by Engle (1982). This concept may successfully be applied in models for volatile markets. in speculative markets like exchange rates and stock markets you can observe that large and small errors tend to occur in clusters. It looks something like 'autocorrelation in the heteroscedasticity'. Engle formulated the notion that information from the recent past might influence the conditional disturbances variance. Therefore, the conditional variance, or the volatility, of a variable will be modeled. Engle postulated the following relationship, which would be known as an ARCH(p) model:

$$\sigma_{u_t}^2 = \alpha_0 + \alpha_1 u_{t-1}^2 + \cdots + \alpha_p u_{t-p}^2$$

ARCH provided a framework for analysis and development of time series models of volatility. However, ARCH models themselves have rarely been used in the last decade or more, since they bring with a number of difficulties as outlined by Brooks (2002) such as: how to decide the number of lags of the squared residuals in the model; how to decide the number of the squared errors that are required to capture all the dependence in the conditional variance that might be very large; and non-negativity constraint might be violated. Therefore, a natural extension of an ARCH(p) model which overcomes some of these problems is a GARCH model. Meanwhile, as a way to model persistent movements in volatility without estimating a very large number of coefficients in a high-order polynomial α (L). Bollerslev and Taylor (1986) suggested a GARCH model. The

GARCH model allows the conditional variance to be dependent upon previous own lags, so that the conditional variance equation in the simplest case is now

$$\sigma_t^2 = \alpha_0 + \alpha_1 u_{t-1}^2 + \beta \sigma_{t-1}^2$$

Since the model is no longer of the usual linear form, OLS cannot be used for GARCH model estimation. There are a variety of reasons for this, but the simplest and most fundamental is that OLS minimizes the residual sum squares. The RSS depends only on the parameters in the conditional mean equation, and not the conditional variance, and hence RSS minimization is no longer an appropriate objective.

In order to estimate models from the GARCH family, maximum likelihood is employed. Essentially, the method works by finding the most likely values of the parameters given the actual data. More specifically, a log-likelihood function is formed and the values of the parameters that maximize it are sought. Maximum likelihood estimation can be employed to find parameter values for both linear and non-linear models.

In the context of conditional heteroscedasticity models, the model is $y_t = \mu + \varphi y_{t-1} + u_t$, $u_t \sim N(0, \sigma_t^2)$, so that the variance of the errors has been modified from being assumed constant, $\sigma^2$, to being time-varying, $\sigma_t^2$, with the equation for the conditional variance as previously. The *LLF* relevant for a GARCH model can be constructed in the same way as for the homoscedastic case by replacing.

$$\frac{T}{2} \log \sigma^2$$

with the equivalent for time-varying variance

$$\frac{1}{2} \sum_{t=1}^{T} \log \sigma_t^2$$

and replacing $\sigma^2$ in the denominator of the last part of the expression with $\sigma_t^2$. Intuitively, maximizing the *LLF* involves jointly minimizing

$$\sum_{t=1}^{T} \log \sigma_t^2$$

and

$$\sum_{t=1}^{T} \frac{(y_t - \mu - \emptyset y_{t-1})^2}{\sigma_t^2}$$

(since these terms appear preceded with a negative sign in the *LLF*, and $-\frac{T}{2}\log(2\pi)$ is just a constant with respect to the parameters). Minimizing these terms jointly implies minimizing the error variance (Brooks, 2002).

## 2.2 Foreign Exchange Volatility: The Empirical Literatures

There are many studies concerning exchange rate volatility. On one part, the study concerns mostly in investigating the impact of exchange rate volatility on economic variables. On the other part, the study investigates the sources of the volatility. However, among other things (such as the subject of study), they differ in the way of modeling exchange rate volatility. According to this modeling, they can be divided into two groups – the ones that use various modifications of standard deviations and the ones that use modifications of the ARCH approach.

Two economists - Belke and Setzer (2003) – investigate the impact of foreign-exchange volatility on the labor market. In their case, the exchange rate volatility is measured as the standard deviation of the 12 month-to-month changes in the logarithm of the spot rate. Meanwhile, Dell'Ariccia (1999) studies the effect of exchange rate volatility on bilateral trade flows. He uses not only the standard deviation of the first difference of the logarithmic exchange rate but also employs two other measures – the sum of the squares of the forward errors and the percentage difference between the maximum and minimum nominal spot rate. Other similar studies performed by Kenen, Rodrik, 1986, Koray, Lastrapes, 1989, Chowdhury, 1993, Kóbor, Székely, 2004, and Bulí, 2005 that model the exchange rate volatility as the moving sample standard deviation of the growth rate of the real exchange rate.

Baum et al. (2004) analyzes the impact of exchange rate volatility on the volume of bilateral exports. Quite similarly, Choudhry (2005), investigates the influence of exchange rate volatility on real exports, apply the GARCH model for measuring volatility. Kocenda and Valachy (2006), analyzing recent developments in exchange rate volatility in the Visegrad Group countries, suggest usage of the leverage GARCH model. Moreover, exchange rate volatility and the TARCH model are analyzed also in studies by Kocenda (1998) and McKenzie (2002). Although the TARCH approach is mostly employed in papers analyzing stock price movements, Kocenda (1998) claims that with regard to risk there is almost no difference between holding foreign exchange and equity. For this reason, he stresses the justification of using the TARCH approach also for modeling exchange rate volatility. Thus, this latter approach–ARCH– is plausible also for this research because its modification allows for an asymmetric, i.e., more realistic, impact of news on exchange rate volatility.

The following three papers are similar in focusing on the same objects – the Visegrad Group countries. Kóbor and Székely (2004) study volatility using a Markov regime-switching model which allows them to identify periods of highly and lowly volatile exchange rates. Not surprisingly, their results say that volatility between these periods changes and is lower in lowly volatile periods. They also claim that there are substantial differences in volatility among the four countries. Bulí (2005) looks at the relationship between exchange rate volatility and financial market liberalization and concludes that liberalization significantly contributes to the stability of the exchange rates in all four countries. Kocenda and Valachy (2006) compare exchange rate volatility between fixed and floating regimes. Their findings confirm natural expectations that volatility increases under a less tight, i.e., floating regime. Moreover, they augment the TARCH model by inclusion of an interest rate differential and its inter-temporal change in order to account for their impact on volatility. They claim asymmetric decreasing effects of news on exchange rate volatility, as well as contemporaneous impact of the interest differential.

Aysoy et al. (1996) assess the daily exchange rates in the Turkish foreign exchange market within the framework of volatility and day-of-the week effect for the period January 1988 to December 1995. They find that the volatility of the Turkish foreign exchange market is low except instability and crisis period and all week days are significant in US dollar and German mark return series according to the GARCH (1,1) model with a crisis dummy in variance function. The other study performed by Akcay et al. (1997) search for the currency substitution's effect on exchange rate instability in Turkey using EGARCH-M model for the period January 1987 to March 1996. Their results assert that the higher the dollarization, the higher is the volatility of the exchange rate. Moreover, the ARCH-M coefficient is positively significant implying that an increase in the conditional variance of depreciation will increase the mean of depreciation series itself. Guleryuz (1998) examines the period between January 1989 and April 1998 under different models and offered the ARMA(2,2)-ARCH(2) with dummy on Thursday in variance model as the best explaining model according to significance of parameters, R2, AIC and SBC. On the other hand Tuna (2002) investigates the relationship between CBRT monetary policies and exchange rate volatility using ARCH (1) model.

In the case of Turkish, Domac and Mendoza (2002), Agcaer (2003), Guimarães and Karacadag (2004) and Akinci et al. (2005a) and (2005b) investigate the effectiveness of interventions in Turkey in the aftermath of float in February 2001. Domac and Mendoza (2002) investigate the impact of CBRT's auctions on exchange rate volatility for the period February 22nd 2001 to May 30th 2002. They employ EGARH model in order to investigate the distinguishing effects of sale auctions on the conditional variance. To signal exchange policy intentions, a dummy is included which takes a value of unity on the day of public report. Moreover, overnight interest rate is added to the model in order to discover the effects of auctions in the money market. Their results suggest that overall central bank auctions have reduced the conditional variance. However, when the impact of auctions is studied separately, the reduction of volatility is a result of sales and purchase operations do not seem to have statistically significant effect on volatility of exchange rate. Furthermore, the results imply that an increase in the overnight interest rate has a negative effect on exchange rate volatility.

## 3   Application of Volatility Models to Indonesia

### 3.1  Measure of Volatility

Regarding the dependent variable, i.e., the volatility of exchange rates, the general autoregressive conditional heteroskedasticity (*GARCH)* model, is employed. This model comprises a leverage term that allows for the asymmetric effects of good and bad news. The *GARCH (p,q)* model is specified as:

$$r_t = a_0 + \sum_{i=1}^{p} a_i r_{t-i} + \sum_{i=0}^{Q} b_i \varepsilon_{t-i} \, ; \, \varepsilon_t \sim N(0, \sigma_t^2)$$

$$\sigma_t^2 = \omega + \sum_{i=1}^{p} a_i \varepsilon_{t-1}^2 + \sum_{i=1}^{q} \beta_i \sigma_{t-1}^2$$

where variable $r_t$ is the exchange rate return over two consecutive trading days, and $\sigma_t^2$ is the conditional variance that is a function of not only the previous realizations of $\varepsilon_t$, but also the previous conditional variances. The additional restriction $\sum_{i=1}^{p} a_i + \sum_{i=1}^{q} \beta_i < 1$ is a sufficient and necessary condition for stability of the conditional variance.

### 3.2  Overview of the Data

A broad consensus has emerged that nominal exchange rates over the free float period are best described as non stationary, or specifically I (1), type processes: see e.g. Baille and Bollerslev (1989b). Therefore in this empirical study, exchange rate series is calculated as the daily difference in the logarithm form:

$$Dlfx = \ln fx_t - \ln fx_{t-1} \text{ or } (fx_t/fx_{t-1})-1$$

The foreign exchange rate data (*fx*) are the daily market foreign exchange closing rate for 1 USD. Data consist of daily prices from 3 January 2008 and 31 December 2013, for a total of 1,564 observations excluding

weekends and holidays. In fact, the sampled period offers clear picture as it includes both appreciation and depreciation periods, and both selling and purchasing foreign-exchange interventions by BI.

Graphical illustration of the data in Figure 1 displays volatility clustering which means that there are periods of high and low variance.

**Figure 1** *Volatility in USD/IDR series (daily return)*

Before modeling time series data, it is important to check stationarity of the data. In order to test the stationarity of the series three different unit root tests: (1) the Augmented Dickey-Fuller (ADF) test with optimal lag length determined by both the Schwarz Info Criterion and Akaike Info Criterion, (2) the Phillips-Perron (PP) test, and (3) the Kwiatkowski-Phillips-Schmidt-Shin (KPSS) test are employed. While the ADF and PP test statistics test the null hypothesis that exchange rate return series contains a unit root, KPSS statistics test the null hypothesis that series is stationary. The tests are repeated with constant term and with constant and trend terms. Table 1 displays the results of the tests and all tests indicate the stationarity of the return of the foreign exchange rate series denoted with $R\_Spot_t$ I(0).

**Table 1** *Unit Root Tests*

Additionally, Table 3 reports the Ljung-Box–Pierce Q statistics of autocorrelation of the deviations and the squared deviations of exchange rate series from its sample mean. Ljung-Box–Pierce Q statistics carries out the Breusch-Godfrey Lagrange multiplier test for high-order serial correlation. While the Q-statistic of the deviations employed to detect autocorrelation, Q-statistic of the squared deviations ($Q^2$), are employed to test the volatility clustering or ARCH effects. For the exchange rate series, the statistics are calculated for lags up to 36 days. According to the results, there is serial correlation and $Q^2$ statistic displays strong evidence of ARCH effect. The null hypothesis of the test is that there is no serial correlation in the residuals up to the specified order. Rejection of the null hypothesis implies volatility clustering in the series.

**Impact of Central Bank's Foreign Exchange Interventions**

Generally, the literature investigating Indonesia experiences focused on the effectiveness of the Bank Indonesia (BI) interventions in general. Differently, in this study the impact of the Bank Indonesia's sell of foreign-exchange intervention (d_Int_sell_spot) and other possible relevant variable such as NDF rate and real interest rate differential (RIRD), will be examined. Therefore, the following model is proposed to model mean of the exchange rate returns and conditional volatility as follows:

$$R\_Spot_t = a_0 + a_1 R\_Spot_{t-1} + a_2 R\_NDF_t + a_3 RIRD_t + a_4 D\_INT*Sell\_Spot_t + \varepsilon_t \qquad (1)$$

$$\varepsilon_t \mid \Omega_{t-1} \sim N(0, h_t)$$

For GARCH (1,1)

$$h_t = b_0 + b_1 R\_Spot_{t-1} + b_2 R\_NDF_t + + b_3 RIRD_t + b_4 D\_INT*Sell\_Spot_t + \alpha \varepsilon_{t-1}^2 + \beta h_{t-1} \qquad (2)$$

where $b_0$, α, β > 0 dan α + β < 1

***Table 4** Results of Model 2 (With-Without FX Intervention by the Central Bank)*
*Figure 3 Conditional Standard Deviation of GARCH*

The results of standard OLS estimation of equation (1) are reported in Table 2, with the test statistics applied to estimated error terms. As can be seen from the graphical representation of estimated errors (Figure 2), although addition of explanatory variables to the model relatively loosens the clustering, the ARCH effect in series is obvious. Moreover, Ljung-Box serial correlation tests show sign of autocorrelation and the test p-values of $Q^2$ shown in the Table 2 are all zero, resoundingly rejecting the "no ARCH" hypothesis. As for the ARCH LM test for absence of conditional heteroscedasticity, it is highly significant at any level.

Results of the Model 2 (volatility), estimated with GARCH (1,1) is displayed in Table 4. According to the results of the model, the results confirm IRP theory, which suggests that an increase in real interest rate parity (RIRP) causes appreciation of the domestic currency. Furthermore, foreign exchange sale interventions lead return of exchange rate to decrease. Besides, foreign-exchange sale intervention is estimated to be negative and statistically significant, which can be interpreted as, an increase in foreign-exchange sale intervention causes Indonesian Rupiah Return to decrease. It is obvious that policy response in minimizing exchange rate volatility can be said to be effective as it can reduce the volatility of USD/IDR. On the other hand, the NDF return has positive impact on the on-shore exchange rate return. When the impact on return of exchange rate investigated, as expected, R-NDF is estimated to be positive and statistically significant, which can be interpreted as, an increase in return of NDF causes Indonesian Rupiah return to increase for more. Therefore, it is important for the central bank introducing a new policy called JISDOR (Jakarta Interbank Spot Dollar Rate) to reduce the role of NDF in driving on-shore exchange rate.

The coefficients on all three terms in the conditional variance equation are highly statistically significant. Also, as is typical of GARCH model estimates for financial asset returns data, the sum of the coefficients on the lagged squared error and lagged conditional variance is very close to unity. This implies that shocks to the conditional will be highly persistent. This can be seen by considering the equations for forecasting future values of the conditional variance using a GARCH model given in a subsequent section. A large sum of these coefficients will lead future forecast of the variance to be high for a protracted period. The conditional variance coefficients are also as one would expect. The variance intercept term 'C' is very small, while the coefficient on the lagged conditional variance ('GARCH') is smaller at 0.73 when the Central Bank enter the domestic FX market.

*Table 5 Q, Q,2, and ARCH LM Test Statistics of GARCH Model*

As can be seen from the table, the sale interventions have significant impact on exchange rate return. That is, sale intervention cause USD/IDR return to decrease slightly. The results also suggest that return of NDF is significant and implies the increase of NDF return will increase USD/IDR return.

The Ljung-Box test statistic for the standardized error terms, $\varepsilon_t/h_t^{1/2}$ and the standardized squared error terms $\varepsilon_t/h_t^{1/2}$ from the estimated GARCH (1,1) model are displayed in the Table 5 and thus do not indicate any further first or second order serial dependence. Moreover, ARCH LM test statistics approve the removal of ARCH effects from the series.

Given Bank Indonesia's objective for foreign currency intervention, efficacy is mainly assessed in relation to rupiah volatility. Rupiah volatility has diminished since free floating was adopted, suggesting the effectiveness of intervention and other monetary measures. However, in Bank Indonesia's perspective, to assess the effectiveness of foreign exchange intervention, one should examine a number of aspects that are in line with the central bank's overall objective of maintaining price stability as well as monetary and financial system stability. First, there is the question of what the objective of the exchange rate policy is – merely smoothing volatility, or also managing the path of exchange rate movement, gaining the ability to influence exchange rate expectations, and other things. Second, there is the matter of the depth and behaviour of the microstructure of the foreign exchange market, e.g. the number of players, volume of transactions, availability and variety of financial instruments, liquidity conditions and distribution across players, counter-party risks, and the infrastructure needed for efficient market functioning. The other aspect that is often important for the effectiveness of foreign exchange intervention is the adequacy of international reserves relative to the depth of the markets and the country's external vulnerability. The more reserves there are, the credibility of the central bank improved. In Indonesia's case, we view exchange rate movement as not always reflecting the economic fundamentals, let alone being consistent with the overall objective of achieving price stability and supporting financial system stability. Exchange rate overshooting occurs because of a number of factors, e.g. volatile capital flows, irrational behaviour of market players, and the microstructure conditions of the market, as well as influence from offshore markets. Thus, as stated above, the objective of foreign exchange intervention is to stabilize the exchange rate along its fundamental path. And judging from the perspective of this objective, the intervention conducted has proven able to manage the exchange rate volatility and ensure a path that is consistent with achieving the inflation target and supporting financial stability. Over the more medium term, the rupiah gradually appreciated during the period up to August 2011 and has been gradually depreciating since, reflecting overall macroeconomic developments during these two episodes in the Indonesian economy.

From the short-term perspective, the effectiveness of intervention in influencing exchange rate expectations is more difficult to assess, since the exchange rate is more susceptible to news developments and market reactions to them. In general, when market reactions are not excessive, supply and demand in the market in most cases can balance each other, and intervention may be more effective in influencing both the spot and forward exchange markets if it is used to deal with any remaining excess demand or supply in the market. Information on the distribution of spot quotations and forward forecasts among market players could be used as input when conducting intervention.

However, when news and market reactions are erratic, these two distributions tend to widen, and even their central tendencies tend to diverge from the central bank's view on where the fundamental exchange rate path should be. The spread between offshore and onshore exchange rates also tends to widen. An example is what happened to the rupiah early this year, when the news included a number of negative items, including widening current account deficits, the issue of increasing fuel subsidy burdens and fiscal sustainability, and worries about foreign exchange liquidity in the domestic market. The spread between offshore and onshore forward rates widened to as much as Rp 275 or about 2.8 percent of the Rp 9650 per US dollar exchange rate at that time (Figure 4). The spread is closing at present, as the central bank intensifies its efforts to supply foreign exchange to the market and its communications on the balance of payments situation.

**Figure 4** *Exchange Rate: Onshore vs NDF*

**Figure 5** *Volume of FX Transactions*

The microstructure of the domestic foreign exchange market also influences the effectiveness of intervention. Even though there are 72 foreign exchange banks in Indonesia, only about 22 to 38 banks actively trade in the foreign exchange market. Domestic state-owned banks constantly supply foreign exchange, while foreign banks' supply or demand depends on capital inflow/outflow. The volume of transactions is relatively small, and it tends to be larger during periods of heavy portfolio inflows (up to August 2011) but lower afterwards (Figure 5). Most transactions are spot, although forward transactions are developing. There are counter-party transaction limits, especially for smaller banks. Foreign-exchange transactions must have underlyings and are limited to domestic players only.

Under these conditions, rupiah exchange rate movements are prone to changes in perceptions and market conditions, both domestically and offshore. On one hand, the thinness of the market makes the banks heavily dependent on the central bank to absorb any excess supply in the market (during current account surplus and/or large capital inflow periods) and to supply any excess demand in the market (during current account deficit and/or capital outflow periods). Thus, the adequacy of foreign exchange reserves will increase the effectiveness of intervention, and for that reason it needs to be continuously assessed in relation to current balance of payments dynamics. On the other hand, the effectiveness of intervention will also depend on the central bank's ability to influence market expectations, since short-term exchange-rate movements are susceptible to any change in perceptions under these microstructure conditions.

The foregoing discussion points to the need for complementing foreign exchange intervention with other policies that are designed to manage the volatility of capital flows and deepen the domestic financial market. For that reason, a number of policies have been put in place in Indonesia to manage short-term and volatile capital flows, e.g. a holding period for investment in the central bank bills, limits on short-term offshore borrowing, etc. Capital flow management is guided by the following three principles. First, it must be consistent with principles regarding the foreign exchange system. The prudential measures for managing capital flows apply to both residents and non-residents, and thus they are not regarded as capital controls. Second, Bank Indonesia welcome long-term capital flows that benefit the economy, and thus our measures target short-term and speculative capital flows. Third, the measures are designed so that they can be monitored and implemented effectively.

To increase the supply of foreign exchange in the market, a regulation has been issued requiring that foreign exchange receipts from exports and offshore borrowing be repatriated to domestic banks. Continuous efforts have also been directed toward deepening the domestic foreign exchange market to include offering foreign exchange term deposits, and toward relaxing forward transactions. The most recent measure in this area is the establishment of a market reference rate for onshore foreign exchange transactions (JISDOR – Jakarta Interbank Spot Dollar Rate), including forward transactions, thus limiting the impact of the offshore NDF rate on the domestic market.

## 4   Conclusion

In this research, the sources of USD/IDR exchange rate volatility in Indonesia and the related monetary response, are analyzed. Exchange rate volatility is estimated by GARCH model with emphasis on the monetary response. Exchange rate volatility is determined by several factors such as fundamental economy or sentiment factors. In this research, Bank Indonesia foreign-exchange interventions, NDF return, and real interest rate parity, are considered and their impacts are investigated by bringing such factors together in a general framework and trying to disentangle their significant effects on exchange rate volatility. This study further confirms the assumption that Indonesia as a small open economy tend to have high and persistent exchange rate volatility when this result holds in most open emerging countries.

The fact that the vulnerability of Indonesia may be explained by the different strength it's economic fundamental. According to the results of the model, the results confirm IRP theory, which suggests that an increase in real interest rate parity causes appreciation of the domestic currency. Foreign-exchange-Sale Interventions move return of exchange rate to decrease. It is obvious that policy response by the Central Bank in minimizing exchange rate volatility can be said to be effective as it can significantly reduce the return and lagged conditional volatility of USD/IDR slightly. On the other hand, the NDF return has positive impact on the on-shore exchange rate return. Therefore, it is important for the central bank introducing a new policy called JISDOR (Jakarta Interbank Spot Dollar Rate) to reduce the role of NDF in driving on-shore exchange rate. Either way, further research is needed in order to see other relevant factors that have significant impact on foreign exchange rate volatility.

# Taylor Rule in an Open Economy: Has the Conduct of Monetary Policy Changed in Turkey?

Assoc. Prof. Dr. Kenan Lopcu (Çukurova University, Turkey)

## Abstract

This paper studies whether the conduct of monetary policy has changed in Turkey since 1990s by investigating structural changes in a Taylor type of policy rule. Using recently developed econometric techniques (Kejriwal and Perron, 2010), I first test whether structural breaks have occurred in the policy rule. If the tests corroborate the existence of breaks, then I test whether the relevant variables are indeed cointegrated, following Arai and Kurozumi (2007) and Kejriwal (2008). Finally, I estimate the Taylor-type policy rules for each era to see how the conduct of monetary policy may have changed over time. Contrary to a common belief, the results indicate that no significant changes have occurred in the conduct of monetary policy in Turkey since the 1990s.

## 1   Introduction

There has been a renewed interest in the conduct of monetary policy in the last quarter century. After almost exclusive focus on nonmonetary factors in explaining business cycles in the 1970s and 1980s, a great deal of empirical literature since the late 1980s has documented that monetary policy significantly influences short-term real economic activity. Additionally, the theoretical literature used for policy analysis improved significantly, giving birth to a new loose consensus called the New Neo-Classical Synthesis or New Keynesian Macroeconomic Model. The New Neo-Classical Synthesis incorporates the techniques of dynamic general equilibrium models from the Real Business Cycle Theory, intertemporal optimization and rational expectations hypothesis of the New Classical Economics and the Real Business Cycle Theory, and nominal and real rigidities from the New Keynesian Economics. The crucial element in the new consensus is that the firm's price setting behavior causes some temporary nominal rigidities thus enabling monetary policy to have real effects in the short run while maintaining the neutrality of money in the long run (Clarida et. al, 1999). Hence, there is now an agreement among macroeconomists that monetary policy is in fact important for the aggregate economic activity in the short run. For the choice of policy rules, Taylor type rules which call for the adjustment of the short run interest rate in response to deviations in output and expected inflation from their target levels are commonly used in the literature. Because the exchange rate is an important component of the monetary policy transmission mechanism in open economies, the TL/$ exchange rate is also included in the analysis to check the robustness of the results.

From the mid 1970s through the early 2000s, Turkey experienced high and volatile inflation along with two severe recessions (1994, 2001) and sharp devaluations. Since the early 2000s, however, inflation has declined gradually while the Turkish Lira has had a tendency to appreciate and output growth has been relatively steady. Meanwhile, the Central Bank of the Republic of Turkey (CBRT) has adopted first implicit (2002-2006), and then explicit (since 2006) inflation targeting policies. Using recently developed econometric techniques (Kejriwal and Perron, 2010) this paper attempts to identify whether structural breaks occur in the relationship between the interest rate and the relevant variables. If the tests corroborate the existence of structural breaks, then I test whether the variables are indeed cointegrated, following Arai and Kurozumi (2007) and Kejriwal (2008). Finally, I estimate the Taylor-type policy rules for each era to see how the conduct of monetary policy may have changed in Turkey since the 1990s.

The analysis indicates that no significant changes took place in the conduct of the monetary policy in Turkey since the 1990s. In particular, no significant change in the response of the CBRT to the expected inflation is observed. Response to the output gap is either not significant or has the wrong sign in all eras, and inclusion of the exchange rate in the analysis does not change the results. .

## 2   Empirical Strategy

The Taylor rule relates the short run interest rate to inflationary expectations and the output gap. For empirical implementation, I start with the following basic model:

$$R_t = c + \alpha_1 E_t inf_{t+1} + \alpha_2 GAP_t + u_t$$

where $c$ refers to the regression intercept, and $E_t inf_{t+1}$ and $GAP_t$ stand for the expected inflation for time t+1 as of time t and deviation of current output from its trend respectively. I start the empirical analysis by investigating the order of integration of the variables, using the ADF (Dickey and Fuller, 1981) and KPSS (Kwiatkowski, et. al, 1992) tests. Next, to assess the stability of the relationship between the interest rate, expected inflation and the output gap, I use the tests proposed by Kejriwal and Perron (2010) involving both I(1) and I(0) but cointegrated variables with multiple structural changes of unknown timing in regression models. If the Kejriwal-Perron tests

corroborate the existence of structural breaks, then I verify whether the variables are indeed cointegrated by cointegration tests following Kejriwal (2008), which are based on the extension of the one-break cointegration tests developed by Aria and Kurozumi (2007) (A-K henceforth) with a null of cointegration. Finally, I estimate the model with breaks to investigate how the policy rule may have altered over time.

### 2.1 Structural Break Tests

Kejriwal and Perron (2010) considered three types of statistics for testing multiple breaks. The first is the sub-Wald test, *SubF*, of the null hypothesis of no structural break against the alternative hypothesis of *k* breaks. The second test, a double maximum test called *UDmax*, checks the null hypothesis of no structural breaks against the alternative of an unknown number of breaks. The third test involves a sequential procedure (*SEQ*) that analyzes the null hypothesis of *k* breaks against the alternative hypothesis of *k+1* breaks. A useful strategy, then, is to use *significant SubF* and *UDmax* tests to decide if breaks exist and subsequently utilize the sequential procedure to determine the number of breaks (Kejriwal, 2008). As an alternative, the number of breaks can also be determined by using the Bayesian information criterion (*BIC*) suggested by Yao (1988) and the modified Schwarz criterion proposed by Liu et al. (1997) (*LWZ*).

### 2.2 Tests for Cointegration with Multiple Breaks

Kejriwal and Perron (2010) showed that the structural change tests they proposed have good size and power properties. In addition, as pointed out in Kejriwal (2008) structural change tests also have power against a purely spurious regression. This means that when the cointegrating relation is unstable, the conventional cointegration tests are biased towards the non-rejection of the null of no cointegration. Hence, cointegration analysis should consider the structural changes. Structural change tests developed by Gregory and Hansen (G-H) (1996) under the null of no cointegration have power against the alternative of a single break, and therefore can have a low power if there is more than a single break. Finally, if the primary concern is cointegration with structural breaks, the null of cointegration is a more natural choice from the viewpoint of conventional hypothesis testing (Kejriwal, 2008).

To avoid these problems, Kejriwal (2008) extends the cointegration test with the known or unknown one structural break tests proposed by A-K to analyze multiple structural breaks under the null of cointegration. The A-K test for cointegration follows G-H regime shift model (C/S) but the null is cointegration with a structural break. The dummy variable that indicates the structural change is defined as in G-H (1996, p.102-103):

$$D_{t\tau} = \begin{cases} 0 \ if \ \ t \le [T.\tau], \\ 1 \ if \ \ t > [T.\tau]. \end{cases}$$

Where the unknown parameter $\tau \in (0,1)$ denotes the timing of the structural change point and [ ] denotes the integer part. Then, the G-H regime shift model is

$$y_{1t} = \mu_1 + \mu_2 \ D_{t\tau} + \alpha_1^{\ T} y_{2t} + \alpha_2^{\ T} y_{2t} \ D_{t\tau} + e_t \ , \qquad\qquad t=1..., T.$$

Where $y_{1t}$ is the I(1) dependent variable, $y_{2t}$ the vector of I(1) regressors and $\alpha_1^{\ T}$, $\alpha_2^{\ T}$ are the row vectors of coefficients. Random term $e_t$ is given by

$$e_t = \gamma_t + v_t \ , \qquad \gamma_t = \gamma_{t-1} + u_t \ , \qquad and \ \gamma_0 = 0.$$

Where $u_t$ is i.i.d. $(0, \sigma_u^2)$ and independent of $v_t$. Under the null of cointegration with a structural break $e_t = v_t$ is stationary, i.e. $\sigma_u^2 = 0$. Kejriwal (2008) augments the above model for multiple structural breaks. Hence, the model for each of the *k+1* regime becomes

$$y_t = c_i + z_t' \beta_i + u_t \quad if \ \ T_{i-1} < t \le T_i \quad for \ i = 1,..k+1 \ .$$

Where *k* is the number of breaks, $z_t$ is a vector of I (1) regressors, given by $z_t = z_{t-1} + u_{zt}$, $y_t$ is the dependent I (1) variable, and by convention, $T_0=0$ and $T_{k+1}=T$. Augmenting the above regression model to deal with the simultaneity bias, the Dynamic Ordinary Least Squares (*DOLS*) is used, adding the leads and lags of the first differences of the regressors.

$$y_t = c_i + z_t' \beta_i + \sum_{j=-l_T}^{l_T} \Delta z_{t-j}' \Pi_j + u_t^* \qquad if \ T_{i-1} < t \le T_i \quad for \ \ i=1,..,k+1 \ .$$

The test statistic for *k* breaks, then, is given by:

$$\widetilde{V}_k(\hat{\lambda}) = \frac{T^{-2} \sum_{t=1}^{T} S_k(\hat{\lambda})^2}{\Omega_{11}}$$

Where $\Omega_{11}$ is a consistent estimation of the long run variance of $u_t^*$, $\hat{\lambda} = (\hat{T}_1/T,......,\hat{T}_k/T)$,

$$S_k(\hat{\lambda}) = \sum_{i=1}^{t} \hat{u}_{i\hat{\lambda}}^*, \text{ and } \hat{u}_{i\hat{\lambda}}^* \text{ represents the residuals from the augmented model above. The break points}$$

$\hat{T}_1,....\hat{T}_k$ are obtained by minimizing the sum of squared residuals. The above test statistics are compared with the critical values for multiple breaks generated by the author, modifying the programs developed for Kejriwal (2008). The critical values change depending on the number of regressors and breaks incolved and the timings of the breaks. Further, as the model studied in the paper involves an I(0) regressor (GAP) the simulations for critical values modified by the author accordingly, generating an I(0) regrressor while setting $e_t = v_t$ under the null.

## 3 Data

The data set is quarterly and covers the period from 1990:Q1 to 2013:Q4. The interest rate series is from the Undersecretariat of Treasury. It is the annual percentage rate on the monthly treasury discounted auctions weighted by quantity and converted to quarterly. The output gap is obtained by the subtracting the GDP trend from the natural logarithm of actual GDP. To obtain the GDP trend, the LOG-GDP series is seasonally adjusted by X-12, and then, the Hodrick-Prescott (H-P) filter is applied to the seasonally adjusted series. GDP series is in 1998 constant prices and obtained from the CBRT. For 1990-1998, it is calculated using the growth rates for GDP in 1987 constant prices. The inflation rate is calculated from the 2005 based harmonized indices of consumer prices, expressed annually and from the International Financial Statistics (IFS). Finally, the proxy for the exchange rate is the TL/\$ buying rate and from the CBRT.

## 4 Empirical Results

In order to scrutinize the integrating level of variables, the *ADF* and *KPSS* unit root tests are employed. Table 1 presents the results. According to the *ADF* tests in Table 1 for all the variables except *GAP* the null of non-stationary in levels cannot be rejected at any conventional significance level. *KPSS* tests also corroborate these results, while both tests provide evidence that the first differences of the variables are stationary. Hence, I conclude that the variables used in the study except *GAP* are integrated order of one, I (1) at levels.

| *dint* | 4 | -6.78** | 23.06** | 4 | -6.63** | 21.98** | 4 | -6.64* | 0.20 | 0.10 |
| Critical (\*\*) % 1 | -4.06 | 8.73 | | 3.50 | 6.70 | | -2.59 | | 0.74 | 0.21 |
| Values (\*) %5 | -3.46 | 6.49 | | 2.89 | 4.71 | | -1.95 | | 0.46 | 0.14 |
| (#) %10 | -3.15 | 5.47 | | 2.58 | 3.86 | | -1.61 | | 0.34 | 0.11 |

Models A, B, C for the *ADF* tests include a constant and a linear trend, a constant, and none, respectively; and $k$ denotes the number of lags. Lags are selected according to $t$, allowing a maximum number of 8 lags. The bandwidth length for the *KPSS* tests is $T^{(1/3)}$.

***Table 1***. *ADF and KPSS Unit Root Tests*

As the next step, I test the null of no structural change in the long-run relationship. The results obtained are reported in Table 2. Overall the tests offer mixed evidence in favor of the presence of break(s). In particular, the *SubF*, *UDmax* tests and the *LWZ* offer no evidence of break. Sequential test, on the other hand, cannot reject the null of one break against the alternative hypothesis of two breaks, but reject the null of two breaks in favor of three breaks. Bai and Perron (2006) suggest that when the parameter values change in such a way that the first and the third regimes are identical, the sequential procedure select no breaks. Further, S*ubF(1)* and *UDMax* test statistics in Table 2 are fairly close to the 10% crtical values of 11.69 and 11.99 respectively. Finally, the *BIC* suggest one break.

It is important to note the break dates selected by the *BIC* and the sequential test, $SEQ_T(3/2)$ , 1994:Q2, 1999:Q4 and 2007:Q2 coincide with the period of two crises in Turkey and the global financial crisis of 2007. The mid-nineties and early 2000s were the periods of financial and economic crises in Turkey, in which the Turkish lira lost its value sharply, interest rates sky-rocketed, and inflation and unemployment began to soar. The

Turkish GDP was also reduced significantly in these crises periods. Hence, it's worth investigating these three potential breaks.

*Table 4. Estimated Regressions with a Single and Multiple Structural Breaks (C/S Model).*

The following step is to confirm the existence of cointegration among the interest rate, expected inflation and the output gap to ensure that the "rejection of stability" is indeed derived from the existence of a cointegration relationship with breaks, and not from a purely spurious regression. In this context, A-K cointegration test for a

single break and cointegration tests with multiple breaks based on the A-K framework, using the break dates selected by the sequential test $SEQ_T(3/2)$ and the BIC, are performed.

The results in Table 3 indicate that the null of cointegration cannot be rejected at any conventional significance levels for one and three breaks cases, and can only be rejected at the 10% significance level for the two break case. As the final step I estimate the above models for which there is evidence of cointegration, and compare the coefficients for the sub periods to see how the cointegration relationship may have changed over time. Table 4 presents the results.

***Table 5.** Estimated Regressions with a Single and Multiple Structural Breaks (C/S Model).*

At the first glance, the response of the interest rate to expected inflation and the output seem to be different in each regime. In particular, the response of the central bank to the inflationary expectations is consistent with a priori expectations but not significant in the last regime, the period in which the CBRT has applied explicit inflation targeting policies. Taking the first regime as the base and testing whether the regime differences are significant, the second and third regimes turn out to be completely dissimilar to the first regime. For the last regime, on the other hand, only the intercept parameter turns out to be significantly different from the first regime.

The differences among the regimes, however, appear to be driven largely by a single outlier in 1994:Q2 (See Figure 1 in the Appendix). Including a dummy variable which takes a value of 1 only for 1994:Q2, reverses the results completely. Table 5 presents the results regarding the significance of differences between the first and the other regimes. According to the results in Table 5, there is no significant difference between the first and the second regime in the one break case. For the two structural breaks case, the first and the third regimes turn out to be identical while the second regime differs significantly only in the intercept. Finally, the first and the last regimes are identical when three structural breaks are accounted for while the second and third regimes are different only in the intercept and the coefficient of the output gap with the wrong sign, respectively.

Overall, the findings in Table 5 indicate that the reaction function of the CBRT has not changed significantly since the 1990s. In particular the response of the interest rate to inflationary expectations appears to be identical for all cases in all the regimes. Including the TL/$ exchange rate in the analysis, do not improve the model. Some coefficients turn out be insignificant or gets the wrong sign. For example, for the three breaks case, inflationary expectations turns out to be significant only in the third regime. Hence, it is likely that the policy rule has been stable since the 1990s.

In light of the results and the discussion above and the mixed I(1), I(0) nature of the regressors in the model, I use Peseran et al.. (2001) bounds testing approach to investigate the existence of long run relationship between the interest rate, inflationary expectations and the output gap for the entire sample period. In the bounds testing approaches, first, the appropriate lag length is selected from a vector auto regressive (VAR) model. Then, the test for the existence of a long run level relationship is performed. Once the level relationship is verified, the long run relationship as well as the error correction representation can be estimated, allowing the lags to be different for each regressor. Table 6 presents the findings.

Table 6 reveals that the CBRT reacts to inflationary expectations, but the output gap has the wrong sign and is not significant. The error correction term indicates that 87% of the deviations from the long run level relationship vanish after a quarter. For the sake of comparison, I apply the bounds testing approach for the post

2000 era. The F test rejects the null of no level relationship at all conventional significance levels. The output gap coefficient becomes marginally significant at 5% level, the intercept term becomes negative but remains insignificant and the effect of inflationary expectations increase slightly. However, the error correction term decrease in absolute value, indicating just over 30% of the deviations from the level relationship vanish after a quarter.

## 5   Conclusion

This paper studies whether the conduct of monetary policy has changed in Turkey since 1990s by investigating structural changes in a Taylor type of policy rule. Using recently developed econometric techniques (Kejriwal and Perron, 2010, Arai and Kurozumi, 2007 and Kejriwal, 2008). Structural break tests provide mixed evidence of regime changes and fail to firmly establish breaks in the monetary policy rule. Although there is a fairly strong evidence of cointegration with structural break at the suggested dates, estimated regressions indicate no significant changes has occurred in the policy rule especially when an existing outlier, 1994:Q2, is accounted for. The effect of inflationary expectations in general is consistent with the findings of other studies for Turkey such as Kesriyeli and Yalçın (1998), Aklan and Nargeleçekenler (2008) and Yıldırım et al (2010).

# Problems of Privatisation and Regulation in Transition Economies

Asst. Prof. Dr. Yeşim Reel (Marmara University, Turkey)

## Abstract

In spite of difficulties, most transition economies in the Former Soviet Union (FSU) and Eastern Europe now have private sectors whose relative size is comparable to the private sectors in Western European countries. The transition countries have had very different objectives, but most started privatisation more or less with the same policy, based on the experience of the United Kingdom, although this was soon to change. While most of the Eastern European countries were fast to adopt modern standards and regulations, some FSU countries have lagged behind. Along with a wide range of gains for producers and consumers, there have been drawbacks, such as social polarisation and forms of capture (of business, of the state). Unlike most analysis of transition, which considers major components, this paper looks at the microeconomics of transition, since this involves the creation of markets through the process of privatisation. In general, transition economies have to develop new institutions and polices to support the privatisation and restructuring. In addition to these, they require regulation, which has been under-developed and causes other, different problems, related to the development of new models. Therefore, the need for a new, third phase of transformation is highlighted. New initiatives on labour, capital and regulation issues become vital now in transition economies.

## 1 Introduction

The transition from state socialism to capitalism or market socialism has been a profound, indeed revolutionary, shift in the socio-economic system of countries with about a quarter of the world's population (Ellman, 2012).

Several critical issues might be related to the successes and shortcomings in transition economies including privatisation, enterprise governance and restructuring, markets and trade, legal systems, finance and corruption. Without even basic market arrangements and accompanying legal system, the process of privatisation is particularly complex and difficult involving a variety of issues that are quite different to those encountered in market economies. Moreover, privatisation is fundamental to transition, since it is, in a sense, just the beginning; after ownership arrangements are changed, it is necessary to undergo restructuring (Gregory & Stuart, 2001).

The transition countries have had very different objectives. In Central Europe the goal was to 'return to Europe'. This meant developing a democratic political system and a capitalist economy. Countries like Poland and Hungary have been successful in achieving these goals. Politically they have had changes of power among different political parties as a result of elections. Economically, they are now capitalist economies of the European type, that is, with considerable welfare expenditures and a substantial state role in the economy. In the countries of Former Soviet Union (FSU), on the other hand, the goals were to end the rule of the Former all-Union Communist party and replace it by rule by local elites, enrich the local elites by looting the national economy, and create an economic system with substantial market elements (especially imported consumer goods). These goals have all been achieved.

In to Poland and Hungary, Slovenia, Estonia, Latvia, Lithuania, the Czech Republic, Slovakia are all democratic capitalist economies and members of the European Union (EU) (Ellman, 2012). It might be suggested that, for these countries, being successful in the transition process has largely been the result of EU accession efforts. The adoption process requires special conditions to be met by potential members, and these countries have tried to make their best efforts to this end. Of course, all transition countries did not have the same characteristics and destinations, and some have made more progress in transition than others, while even the countries that have made the best efforts need to continue to make improvements, for a number of reasons.

The outline of this paper is as follows. The next section presents the main characteristics of transition economies. Then, the third section analyses privatisation and regulation problems in transition economies. This section is divided into two subsections. The first covers privatisation experiences in transition economies, and the second analyses privatisation and regulation problems. The paper ends with some concluding remarks.

## 2 The Main Characteristics of Transition Economies

In the planned socialist economies, decision-making powers were substantially concentrated in the government, which conducted economic management by directing and encouraging other economic units to implement plans. State ownership was dominant, with enterprises deprived of powers to make business management decisions. Free transactions and free competition had usually been eliminated. Capital markets had been similarly eliminated, and enterprise management linked to state finance. Monetary systems were merely complementary to state finance.

In order to build market institutions and organizations, human resources must be developed to make up such institutions and act within the institutions for market organization purposes. People who have been used to a planned socialist economy for a long time have no experience, knowledge or know-how of a market economy. In the transition to a market economy, therefore, these people must jump into an unknown world. The government of an economy in transition needs to create market economy institutions and organizations through efforts to develop people as market economy players or actors (Nishimura, 2001).

In addition to the labour (human resources) dimension of the transition process, there are at least three basic challenges that confront governments in pursuing a transition to a market economies. The first concerns market economy policy. This is something that governments in economies in transition have generally tackled and will have to continue to do so. The second is that of economic independence. Countries that have won political independence need also to secure their economic independence. The third is economic development, because most economies in transition are low- or lower-middle-income countries. Economic development is important particularly for the governments of Central and East European countries pursuing EU accession. It is suggested that the economic policy experiences of Russia and other FSU Republics together with Eastern European countries are the most important of the challenges facing economies in transition (Nishimura, 2001).

According to Donnorummo (2006), three of the main factors that affect the relative success of a transition process are the impact of historical background and the conditions confronted by each country at the start of the transition, government reform policies undertaken during the transition, and the presence or absence of military conflicts. The historical background and conditions refer to variables such as cultural traits and values, geography, relative levels of wealth and economic structures at the start of the transition, when these variables have a strong impact. Clearly, these factors vary considerably across countries (Koyame-Marsh, 2011).

There is widespread recognition that creating competitive markets, and the infrastructure that underpins them, is an essential part of the transition process.

The potential for developing competitive markets in transition economies has been inhibited by the inadequacy of both the institutional and physical infrastructure inherited from the socialist era. There were virtually no market-oriented institutions, including legal and regulatory frameworks to enforce contracts, protect private property, and preserve a level playing field for competition and market entry. Moreover, physical infrastructure, such as transport and telecommunications, had been designed to meet the needs of a highly vertically integrated production and distribution system. Under central planning, there were very few small-to medium-sized firms, little horizontal communication between enterprises, and relatively limited provision of information to buyers and suppliers (Aghion & Schankerman, 1999).

The transition economies continue to be characterised by the presence of major capital and product market imperfections, as well as weak regulatory and institutional regimes. These features have implied more severe, underlying problems with both incumbent monopolists and incumbent managers. For these reasons, changes in ownership without adequate attention to market structure can result in longer-term negative effects (Commander et al., 1999).

## 3 Privatisation and Regulation Problems in Transition Economies

### 3.1 Privatisation Experience in Transition Economies

Privatisation has been a particularly important phenomenon in the transition process in Central and Eastern Europe from planning to execution and functioning of a market system. This is because communist regimes had placed almost all the productive assets of the economy into state hands, partly for ideological reasons and partly to facilitate the planning process. As a result, countries like Czechoslovakia and the Soviet Union contained virtually no private sector at all – typically in excess of 90% of assets were state owned – and even in countries with slightly larger private sectors, like Poland or Hungary, private ownership was concentrated in agricultural and handicraft activities; industrial firms were all in state hands (Estrin, 2007).

Since late 1989, when communism collapsed and the Soviet Union withdrew both militarily and politically from Central and Eastern Europe, most countries in that region have gone through a considerable restructuring of their economies, including major privatization. These countries often adopted contrasting strategies, however. They not only had domestically planned economies, but also partook in economic planning at a regional level (Bjonrskov & Potrafke, 2011).

Privatisation means the transfer of enterprises from the public to the private sector. The transfer itself involves revision to a specific law and can be implemented if the government is willing to make such change and gets social consensus to enact such. However, the transfer is only the first step of privatisation, because the transfer itself is separated from the problem of whether a new owner of a privatized enterprise can manage the enterprise as a private-sector owner. From the economic viewpoint, the essential problem with privatisation rests on this point. In this respect, the government must develop a business environment that encourage enterprise owners to manage their enterprises reasonably, establish corporate and other laws requiring and providing for reasonable

activities on the part of privatized enterprises, and train enterprise owners as market economy actors. These are key challenges for privatisation (Nishimura, 2001).

Privatisation is a redistribution of equity rights from the state to individuals. The fundamental objective is to change the way decisions are made, so that the allocation of resources will be directed by the forces of supply and demand and profit maximization. These forces are themselves only beginning to emerge. Most microeconomic analyses of privatized enterprises in transition economies, especially in the Russian case, conclude that restructuring has not occurred. First, to the extent that state funds still find their way into enterprises, especially sectors such as heavy industry and defence, hard budget constraints have not replaced soft budget constraints. Second, although formal ownership arrangements have changed, it is not clear that the rise of barter in the late 1990s is a serious challenge to the development of a market economy in Russia. Third, in the absence of a flexible and meaningful price system, information signals in the institutional setting have limited use (Gregory & Stuart, 2001).

The most impressive feature of privatisation in the transition economies has been the speed and scale at which it occurred. The reforming governments of the late 1980s and early 1990s managed successfully to transfer the greater part of the huge state-owned sector into private hands in a time period of hardly more than a decade and to do so they had to use innovative privatisation methods. However, this led them to introduce private ownership into situations where other crucial aspects of the business environment were not yet sufficiently developed to support the private economy. We find that privatisation appears to have provided governments with much needed revenues. However, at the enterprise level, the results on performance are patchier, although, on balance, the effects of privatisation have probably been positive, especially when the new owners were foreigners.

The most serious problem for privatization as a policy has been in situations where it has been used while the legal and institutional environment is weak (Estrin, 2007). In this situation, different institutional arrangements provide different incentives for governmental and mass privatisation institutions as they perform their role as transitional owners and final sellers in the privatisation process. The institutional framework critically affects the quality and the speed of every large privatisation program in transition economies (Simonet et al., 2004).

While most of the Eastern European countries were fast to adopt to modern standards and regulations, some FSU countries lagged behind. At the same time that Hungarian, Polish and Latvian businessmen were learning how to compete in the market, playing by the rules, Russian and Ukrainian big businessman rarely lobbied for good laws and regularly settled disputes outside of court and bribed regulators, police and political authorities to protect their property. A reformer should be afraid not of populism but of the capture of politics by the new elites (Sonin, 2013).

Most countries of the FSU have not obtained much economic freedom, getting heavy and corrupt administrative regulation instead, in the form of lengthy, complicated and non-transparent entry regulation and a variety of regulations on existing business. These regulations benefit corrupt bureaucrats (who collect bribes in exchange for getting around rules) and incumbent monopolies (as entry barriers protect them from potential competition both in the product and labour markets) (Sonin, 2013).

The introduction of (legal) private trade, private production and private ownership of the means of production has brought many benefits to the populations of the transition countries. For entrepreneurs, it has brought the possibility of developing and marketing new products and processes. For workers, it has brought a choice of employers. For consumers, it has brought a much wider assortment of goods and services. However, the efficiency-raising effects which economists expected from the privatisation of state-owned enterprises often did not materialise, or not, at any rate, in the short term. In some countries, privatisation led to a dramatic polarisation of society, with a small, very rich minority of politically well-connected people on hand, and a large impoverished part of the population, on the other. This is one of the explanations for the widespread nostalgia for the old system (Ellman, 2012).

From the beginning, the transferring of property rights from the state to the private sector was seen as an essential part of the transition process. The privatisation process turned out to be a very complex process. Citizens had little non-labour wealth and the institutions needed to support good corporate governance in a market system did not exist (Miller, 2013).

The process of large-scale privatization in FSU economies was a historically unprecedented experience for which no ready recipes existed. Most economies in transition started privatisation more or less with the same policy, based largely on the experience of the United Kingdom. This involved a reassertion of the state's property rights over enterprises (called, in general, 'commercialisation') and a centralized policy of sales after a process of valuation of the enterprises picked out by government for privatisation. This policy was quickly abandoned in all countries.

Later in the transition process, one would might have thought that all countries would converge to a policy of mass privatisation by giveaway, through vouchers. This has not been the case either. Each economy in transition developed its own privatisation policy, with different combinations of direct sales and managerial buyout, as well as vouchers. Hungary, for example, has consistently avoided mass privatisation. The actual practice of

privatisation differs even more as some policies that appeared politically feasible in some countries did not in others where political constraints forced policy changes (Roland, 2000).

In spite of the difficulties, most FSU and Eastern Europe transition economies now have private sectors whose relative size is comparable to the private sectors in Western European countries. At this juncture in many countries, the large-scale privatisation process has largely been completed. The results, however, are mixed. Governance structures have not developed as quickly as privatisation itself.

Governance structures thus still need to be greatly strengthened before the full potential benefits of privatisation can be realised (Miller, 2013).

The private sector has, nevertheless, become an important part of the economy in most transition countries. In 13 of 28 countries in the European Bank for Restruction and Development (EBRD) studies, the private sector represented at least 70 per cent or more of GDP by 2010. In several other countries, the private sector share was between 60 percent and 70 per cent (Bosnia/Herzegovina, Moldova, Montenegro, Russia, Serbia and Ukraine). In a few countries the private sector share was much lower (Belarus [30 per cent], Tajikistan [55 per cent], Turkmenistan [25 per cent] and Uzbekistan [45 percent]). Despite these differences, the percentage share of the private sector in almost all countries has been remarkably stable over the past few years - an indication that the big push towards privatisation is largely over, even in countries where the share of the private sector is still low (Miller, 2013).

### 3.2 Privatisation and Regulation Problems in Transition Economies

In the early 1990s, privatisation was widely considered one of the keynotes of the entire transition process. The policy arguments were based on the successful experience in developed economies, as well as on evidence from developed and middle-income countries, which suggested that privatisation improves enterprise efficiency. However, it was widely recognised that privatisation on its own might not be sufficient, and that systemic changes and policy reforms were a prerequisite for successful transition (Estrin et al., 2009).

The cornerstone or key building block of capitalism (and democracy as well) is private property. Privatisation is absolutely necessary, but not sufficient, for a successful transition. Some of the errors of the early transition period were the result of a failure to fully comprehend the limitations of both the market and privatisation. There was often an over emphasis on what private ownership (or more generally, the market) by itself could accomplish. It was wrongly assumed that if a country opened its economy and privatized, all the malfunctions of the flawed communist ancient regime would disappear and matters would be set right. One can hold that this was an extremely naive expectation without being in the least bit opposed to an open economy or private property (Donnorummo, 2006).

While there was the need to privatise, it need not have been done all at once, nor was there any model that dictated how much should be privatised, even though most believe a large majority of the economy should be privatised by the end of the transition road. There was no blue print that stipulates that everything, including public transportation and the production and distribution of raw materials and energy must be privately owned. However, most transition countries have tried to apply the models of developed countries.

There is also so single specific model of capitalism (the same is true about democracy). The basics components of capitalism must exist and be dominant, but the precise shapes that these basic elements assume should be determined by the prevalent cultural values, relative strength of civil society, existing economic structures, level of economic development and security needs of each individual state/society (Donnorummo, 2006).

Furthermore, as Banerjee and Munger (2002) assert, privatisation is a means to an end rather than an end in itself. The decision to privatise is captured in three related, but distinct, dependent variables: (1) timing, (2) pace, and (3) intensity. Although political benefits may explain the timing, pace, and intensity of privatisation, in fact, the effects are very different in each case.

An important development in the FSU was the demonstration that, when the institutions necessary for an efficient market economy are lacking, just destroying the institutions of the old system and hoping that market-friendly institutions will emerge spontaneously can have serious adverse consequences. The absence of adequate market institutions not only leads to rent-seeking behaviour by individuals and firms, but can also lead to the creation of new institutions that are incompatible with a market economy (Ellman, 2012).

Additionally, because of the restructuring was largely left to market forces, the emphasis was almost exclusively put on deregulation. This led to insufficient attention being paid to creating supportive regulations and the institutional capacity required to overcome market failures and to ensure that restructuring decisions approximate to socially desirable ones (Commander et al., 1999).

On the rebound from the experience of a totalitarian state, transition leaders went to the opposite extreme of wanting to restrict state activity to the minimum and destroy state institutions in order to allow the free play of market forces.

In particular, the role of the state in the establishment, monitoring and regulation of institutions was neglected, in the naive belief that institutions would establish, develop and regulate themselves automatically. For example, it was asserted that a 'market springs up as soon as central planned bureaucrats vacate the field.' Markets are self-regulating mechanisms in the sense of adjusting prices to demand, supply to prices and actual to desired capacity; but they are not generated automatically nor are they self-disciplined. They are socially artefacts that rely on state authority for their validation and regulation, and often for their very existence (Nuti, 2013).

An important question raised is the size and relative strength of the state in transition economies. When the state uses regulatory institutions, this question becomes more important. Of course, the extension of the state's powers had to be severely curtailed from that which had existed in the command economy. A weak and ineffective state, as well as a state with an over powering presence or, put another way, one with either too little or too much control over the economy are both negative factors (Donnorummo, 2006).

Transformation in Central Europe and, to a much lesser degree, since 1999 also in Eastern Europe has been by and large a success story. The classical agenda of stabilisation, liberalisation and privatisation has been accomplished. None of the transforming economies are now struggling with hyper, high or even moderate inflation. None of these countries have a closed economy. The Central Europeans have joined not only the WTO (a task yet to be mastered by Russia, Ukraine and most of the New Independent States), but several of them have joined NATO, the OECD and even the EU. The latter required capital account liberalisation and reasonable exchange rate stability. Finally, as noted, privatisation has progressed considerably. Such 'strategic' sectors as energy generation and banking have also been privatised, often to foreign owners. Meanwhile the definition of the role of the public sector has remained partial and relative indeed. When it comes to a positive vision, a feasible project other than just allowing the erosion or transformation of public firms, then concepts and policies remain vague. The dangers of over-regulation and under-regulation, resulting from poor formulation of the aims, scope and means of public policy, are very real indeed.

The social resistance to privatisation, the inability to come up with a major overhaul of the welfare system and other areas requiring broad social consensus, such as the environment, defence and transport, are indicative of a need for a new, third phase of transformation. In this phase the tasks of Eastern and Central Europeans and of EU incumbents largely overlap. However, and contrary to previous stages, this time there is no 'European model' to be emulated; what is required is yet to be elaborated and tested. Moreover, the EU as an organisation is unlikely to contribute in an immediate route to overcoming these challenges. With the ongoing preoccupation with redistribution, neither political attention nor funding is likely to be focused on those areas of public sector reform where it would most be needed (Csaba, 2005).

The transition has also emphasized that what was required was not just a state that played an important role in the economy but one that acted in the interests of society as a whole – or, at any rate, of a large part of it. A major danger in some of the transition countries, in particular in the FSU, was that of state capture by elites that used the transition for their own pecuniary interests. Russia experienced, first, state capture by business interests, followed by business capture by the state, neither of which were conducive to the development of a modern market economy – the ostensible goal of the transition process. Bulgaria too is a case of very persistent state capture (Ellman, 2012). These capture cases are important in the light also of the regulatory capture problem: states with these capture problems might also follow the interests of business, instead of society, making it highly likely that regulation is captured by business interests.

For countries in transition the government is less and less an economic actor but a crucial rule maker. After the transition management role, the government must play another essential role: the guard and the guarantor of the free-market economic system. In order to maintain the viability of the free-market economy system, its borders should be safely defended by:

• 'Anti-trust' regulations (antimonopoly)

• Laws for property protection and limitation of nationalisation processes

• Fair competition legislation

• Laws for consumers protection (Scarlat & Scarlat, 2007).

State regulations can produce both 'goods' and 'bads'. Regulation can both promote economic and social welfare and lead to significant economic and social costs. It is therefore unlikely that the case for or against state regulation of markets on grounds of 'market failure' or 'state failure' can be convincingly made from first principles or on an a priori basis (Kirkpatrick et al, 2004).

One of the most important shortcomings in the transition process is corruption. Many economists point to one major cause of corruption: bad regulation. Ill-designed policies create corruption incentives for policy makers, bureaucrats and the public in general. From this perspective, it is not the size of government that is the problem, but rather the details of programme and their administration. Reform should avoid rules that are complicated and difficult to administer and should design individual incentives to promote honest decision making. Thus, some 'good' regulation can help contain corruption. For example, privatisation in Eastern Europe involved bribery

because there was too little 'good regulation'; that is, there were too few legal requirements that restricted corrupt deals. Detecting bad regulation and misdirected state intervention can be helpful in identifying areas in which corruption is likely to occur. Bad regulation and corruption are quite often two sides of the same coin. When domestic firms are given preferential treatment in public tenders, this may induce corruption, but it may also be the outright result of strong private interests that capture public funds. In such cases, corruption causes bad regulations, and not the other way round.

A final concern is that the difference between 'bad' and 'good' regulation is far from obvious. One criterion could be whether a regulation creates opportunities for corruption, but then the argument becomes circular and we have no causal theory of corruption. Overall, looking for 'bad' regulation provides some hints for detecting corruption, but falls short of an overarching approach to reform. Even regulations that have strong public justifications as responses to health, safety and environmental concerns can be subject to corrupt pressures (Liou, 2000).

## 4  Concluding Remarks

One of the several critical issues related to the successes and shortcomings in transition economies is privatisation, which is complex and difficult and itself only a prelude to restructuring.

Privatisation process includes denationalisation, regulation/deregulation and contracting out (lease, contract for concessions etc.). For most transition countries, the privatisation experience is a complex of these activities. However, because the restructuring was largely left to market forces, the emphasis was almost exclusively put on deregulation. This led to insufficient attention being paid to creating supportive regulations and institutional capacity ensuring that restructuring decisions were socially desirable.

The transition process has demonstrated the need for an effective and accountable state and the dangers of state desertion. It has also shown the importance in economic life of institutions, path dependence, banks, and financial fragility. It has made clear the need for effective economic policy to take account of structural and country-specific factors. And it has shown that privatisation is much more complex than many foreign advisers thought at the beginning of the transition process. In retrospect, they were rather ignorant about the methods, sequencing, and consequences of privatisation (Ellman, 2012). The transition economies have arrived at a number of different destinations. Because every country has different characteristics, social value and objectives, there is a need to work on each country transition as an individual experience.

Finally, it can be suggested that the role of the state in the transition economies is ambiguous. An important question raised is the size and relative strength of the state in transition economies. Specifically, when the state uses regulatory institutions, this question becomes more important.

# Anti-Keynesian Views: Fiscal and Monetary Guidelines

Asst. Prof. Dr. Özlen Hiç Birol (Istanbul University, Turkey)
Assoc. Prof. Dr. Ayşen Hiç Gencer (Istanbul Aydın University, Turkey)

## Abstract

In this article, we will cover the main anti-Keynesian views and macroeconomic systems that arose in the post Keynes period as well as their fiscal and monetary policy guidelines. As is known, the early Classical economists introduced a macroeconomic system based on the Quantity Theory and Say's Law resulting in automatic full-employment equilibrium; and finally after 1929-1934 Great World Depression, the Keynesian System was introduced as a "revolution" (Keynesian Revolution) in theory and practice. As a result of the Keynesian policies implemented, European countries and the United States not only got over the Great World Depression but also in the years following the World War II, they have observed a fast and stable growth for a long time. Moreover, cyclical fluctuations have been controlled to a great extent. Even so, at the stage when the Keynesian System was introduced, anti-Keynesian views and macroeconomic systems were immediately introduced. Intense academic discussions between advocates of these views and the Keynesian economists have continued up until today. Meanwhile, many economists such as J.R. Hicks, R.F. Harrod, N. Kaldor, M. Kalesci, A.W. Philips, A. Hansen, P.A. Samuelson, E. Domar, J. Tobin, R. Solow, A.M. Okun, W. Helier, G. Ackler, F. Modigliani, and R. Musgrave and many others have developed and defended the Keynesian System from different aspects. We can characterize significant anti-Keynesian views and macroeconomic systems as the "Counter-Revolution".

## 1   Introduction: The Main Anti-Keynesian Macroeconomic Schools

Prominent anti-Keynesian views and systems could be classified under the following headings below:

### 1.1  The Generalized Classical System

The Generalized Keynesian System works with Keynesian macroeconomic parameters and functional relationships but it assumes full flexibility of prices and wages as well as perfect competition conditions in all markets and therefore refutes the Keynesian investment-saving discrepancy. Under these assumptions, the Generalized Classical System concludes that the economy would reach full-employment equilibrium automatically. According to this system, the unemployment would only be "voluntary", and there will be no involuntary unemployment. This system has been defended by Pigou at the very initial stage.

### 1.2  The Neo-Classical Synthesis

A fall in prices following a fall in wages will be resulting in "Pigou Effect". According to Don Patinkin, even if the Pigou Effect does not occur in the short-run and hence because of the dynamic effects and changes in the price expectations resulting from this price fall having negative effects on both investment and consumption expenditure; sooner or later, the Pigou Effect will definitely set in, providing automatic full-employment equilibrium in the macro-static analysis. In this case, theoretically, full-employment equilibrium will be attained automatically. However, since in the short run the negative effects of unemployment and price falls cannot be put up with when there is unemployment in the short run, the Keynesian policies will be implemented. This new approach combining the Keynesian and the Classical views is called the Neo-Classical Synthesis (Paya, 1994).

### 1.3 Monetarism

Monetarism or the monetary approach is introduced by Milton Friedman in 1963. This view comprises a more in-depth analysis of the money demand compared to the Keynesian System (Paya, 1994). It reaches Classical conclusions where the money supply is recommended to be fixed at a rate which corresponds to the growth rate; instead using the money supply as a policy tool for fine-tunings via concomitant changes in the money supply. It concludes that the fiscal policies are ineffective.

M. Friedman who introduced the monetary approach, has contributed to the Philips Curves analysis claiming that after long term changes in the price expectations, the effects changing the prices and wages would disappear, and the negatively sloped short-run Philips Curve in the Keynesian analysis would appear as a steep curve in the long-run; and in this case it is in vain to try to get unemployment rate below the "natural rate of unemployment.

Moreover, M. Friedman had strongly defended the idea that the government intervention, in general, would not be the right policy because it would cause deviations in the economy, thus what is actually required is to minimize the size of the government. From a theoretical point of view, even though this economic conservatism or economic liberalism would not necessarily be the result of monetarist view, in practice, both is interpreted together.

The importance M. Friedman attached to money demand and his analysis that the velocity of money in the long-run being constant, and accordingly, changes in money supply only be affecting the prices in the long-run – even though they might affect the real parameters in the short-run–, do resemble the Quantity Theory of Money,

and in particular, more of Irving Fisher's analyses rather than Alfred Marshall's. There is quite a distinct parallelism in between.

The following economists are renowned as monetarists: M. Friedman, Karl Brunner, Allan Meltzer, and Allan Walters.

### 1.4 The New Classical School

The New Classical School works with rational expectations hypothesis and full flexibility of prices and wages in all markets. The concept of rational expectations was first introduced by J.F. Muth (1961). Robert E.R. Lucas Jr. (1972) developed and popularized this hypothesis. Thomas Sargent, Neil Wallace, Robert Barro are other distinguished representatives of this school.

What is important in the New Classical School is first of all the assumption of full flexibility of prices and wages. As a result of this assumption, all markets will reach equilibrium, and the economy will automatically settle at the point of full-employment. Unemployment will be voluntary which will be denoted as "natural rate of unemployment".

According to rational expectations hypothesis, on the other hand, all the economic agents have full knowledge and information about all economic decisions – including government policies and their effects – and they take into account their future expectations in a right way. In this case, the government policies which will be expected and known to everybody will be already taken into account and the decisions on prices and quantities are formed accordingly, thus prices are formed in a complex fashion. In this way, the efficiency of any government policy is neutralized. Hence, as much as Keynesian financial policies, also the Monetarist monetary policies are ineffective. The only effective impact in economy seems to be "unexpected shocks" and accordingly "unexpected" or "shock" policy implementations.

The New Classical economists working with rational expectations follow M. Friedman in terms of "Philips Curve" (they accept that the Phillips Curve might be steep and even positively sloped) as well as in terms unemployment being voluntary. As a result, natural rate of unemployment will be prevail and it cannot be decreased through fiscal and monetary policies.

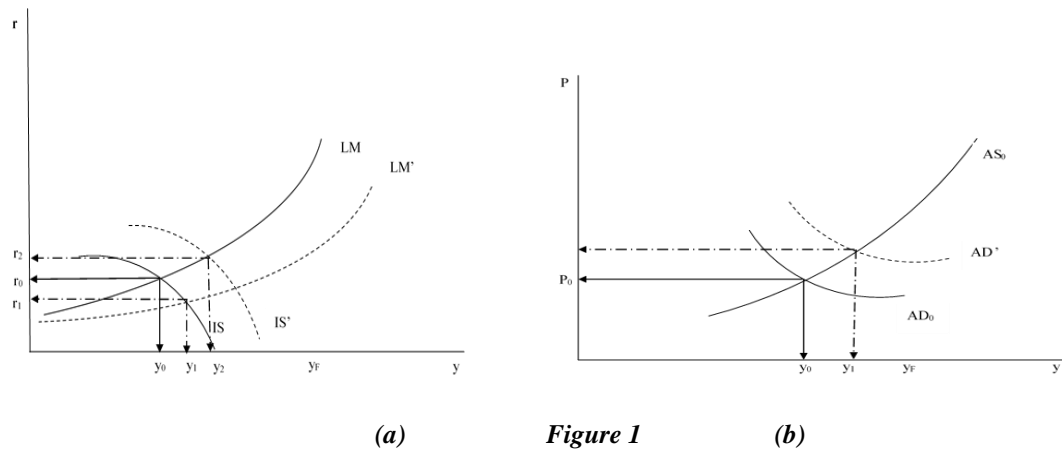
It is noticeable that the views of the New Classical School defending full flexibility of prices and wages leading to automatic full-employment equilibrium and the views of the Generalized Classical System are parallel with each other to a great extent.

It must be emphasized here that the rational expectations hypothesis is a separate assumption as opposed to the assumption of full flexibility of prices (and wages). The assumption of flexible prices leads to the automatic full-employment equilibrium in the New Classical School. On the other hand, the rational expectations hypothesis leads to the conclusion that the previously known policies will be ineffective. Thus, J. Taylor accepting rational expectations but working with the rigidity of prices and wages reaches different conclusions. According to this model, Keynesian involuntary unemployment is inevitable. Hence, even if the rational expectations are accepted, fiscal and monetary policies become more efficient.

All these anti-Keynes views as well as macroeconomic systems, Monetarism in particular, and later on the rational expectations and the New-Classical School have had weight after 70s due to inflationary effects of the Vietnam War and the stagflation following 1973-1974 oil shock. In fact, the monetarist approach hence the economic conservatism both during Reagan era in the United States and Thatcher era in Britain affected the policy implementations for a while. However, it was not possible to prevent inflation; on the contrary, unemployment reached a new and higher dimension. Therefore, once more but this time with more cautious approach, a mix Keynesian and Monetarist policy implementation was adopted. On one hand, radical fiscal policies were implemented in order to prevent or decrease the budgetary gaps, on the other hand, monetary policies were applied for fine-tuning of economy, however this fine-tuning was not in the form of fixing the money supply in the long-run as recommended by the Monetarists. These policies were particularly based on the Keynesian analysis taken up in a broader perspective; that is to say, monetary policies being more effective in recession periods rather than fiscal policies.

In the following sections, all these anti-Keynesian views will be analyzed via the aid of LM-IS and/or AD-AS analysis. Thus, these policy recommendations will be summarized briefly. To be able to understand these anti-Keynesian views, the Generalized Keynesian System will be discussed briefly in the next section.

## 2 Keynesian System and Guidelines of the Keynesian Fiscal and Monetary Policies

In this section, the "Generalized Keynesian System" assuming a low negative interest elasticity of the investment function featuring investment-saving discrepancy will be summarized via LM-IS and AD-AS analysis (Ackley, 1963; Hiç, 1994).


*(a)*         ***Figure 1***         *(b)*

In Figure1 (a), the intersection of LM-IS curves shows the unemployment equilibrium which stems from the lack of effective demand. Either increasing the money supply and/or lowering the wages and prices (assuming that we ignore the fact that the fall in the prices would be having a "decreasing dynamic effect" on consumption and investments) would shift the LM curve to the right, eventually interest rates will decrease thus leading the real income to increase. Nevertheless, this possibility is limited; in other words, monetary policy is not much effective. Fiscal policies (increasing government expenditures and/or decreasing tax propensity) shifting the IS curve to the right will display a higher increase in the real income and the level of employment. Moreover, the fiscal policy tool can create a greater rate of increase than the monetary policy, especially for depression and low income and employment levels. In case of a recession and at higher income levels, this time, the monetary policy becomes more effective than the fiscal policies. This is why, today, in developed countries, fine-tuning of the economy is conducted through monetary policy rather than fiscal policy, and this also is explicable within the Keynesian System.

In Figure 1 (a), the analysis covers the aggregate demand elements. In Figure 1(b), the Keynesian System and its outcome are analyzed through the Aggregate Demand (AD) curve which gives the relationship between the price increases (P) and real income or aggregate real demand (y); as well as the Aggregate Supply (AS) curve in between these two (Branson, 1979). AD is a negatively sloped curve. In the Keynesian System, AS appears to be a positively sloped curve. This can explained by the fact that the entrepreneurs can predict and calculate the price increases and real wages correctly whereas workers have money delusion (Branson, 1979). Alternatively, it is assumed that labor unions and workers will be consciously accepting a fall in their real wages against an increase in the effective demand and employment (Ackley, 1963). The outcome, in two different interpretations, increasing money supply and/or through fiscal policies, an increase in demand will be definitely raising both prices and real income, which means production. (Figure 1(b)). This is the underlying reason of raising the real income through the aggregate demand in the Keynesian System.

From here on, we can proceed to the Philips Curve Analysis. The above explained characteristic of the AS would reveal a negatively sloped Phillips Curve as a relation between the price increases and wage increases and unemployment rate (Branson, 1979). Whether fiscal policy or monetary policy to be implemented in Generalized Keynesian System and how effectively the AD-curve could be raised are already covered above.

## 3   Generalized Classical System with Elastic Prices and Wages: Without Investment-Saving Discrepancy

In the early discussions among the followers of the Keynesian System and the Classical System, A.C. Pigou accepted all the Keynesian parameters and functional relationships, however he assumed that negative interest elasticity of investments is high, hence refuted investment-saving discrepancy. Under the assumption of perfect competition conditions prevailing in the labor market and full flexibility of prices and wages, the equilibrium in economy, this time, will be reached automatically at the full-employment point. In the meantime, workers, like entrepreneurs, are presumed to guess and calculate the wage and price changes as well as the real wages correctly, that means they don't have money delusion. In such a system which is called the "Generalized Classical System", the equilibrium of the economy is summarized in Figure 2 by means of AD and AS curves (Pigou, 1941).
*Figure 2*

Under the above assumptions about the labor market and the supply of labor, the AS curve will be formed at one equilibrium regardless of the level of prices: full-employment real income level ($y_F$). In other words, AS is a perpendicular line at $y_F$ level. In this case, AD will find its equilibrium though the prices at the $y_F$. As a result of an increase in the money supply, AD shifts to the right as AD', prices will increase from P0 to P1. Full-employment real income equilibrium ($y_F$), on the other hand, will not change. This is exactly like in the Marshallian Simple Classical System. Likewise, fiscal policies, too, will be increasing the interest rates, and the rise in interest will be causing a decrease in private investments thus changing the combination of real income and investment (Crowding-Out Effect). But ultimately, real income level will stay the same level, and with the increased interest rate, AD again shifts to the right and the general level of prices will rise.

Fiscal and monetary policy recommendations of this system are quite obvious; like in the Marshallian Simple Classical System; the money supply should be increased at a constant rate to keep the prices stable; money supply increase rate should be equal to or a little bit above of growth rate generated by the capital stock and technological advancement of the economy. The government should conduct only its classical functions, and accordingly, the government budget should to be small and balanced. Since full-employment equilibrium is reached automatically, there is no need for fiscal and monetary policies in order to increase the aggregate demand.

## 4 Pigou Effect, Don Patinkin and the Neo-Classical Synthesis and Policies

The fact that level of savings depends on wealth and negatively related to wealth, in case of a decrease in wages and prices, the real value of liquid wealth (money plus state bonds in the hands of people) will rise in the short-run and consequently, this will decrease the propensity to save (or raise the consumption); this is called the Pigou Effect (or Real Balance Effect) since it was first introduced by Pigou (1941). According to Pigou, even though, as a starting point, the Keynesian unemployment equilibrium is accepted; a fall in the wages and correspondingly a fall in the prices (ignoring the negative dynamic effects of price decreases on investments and consumption) will decrease the propensity to save. Thus, full-employment will be reached automatically equaling investment with saving at a positive interest rate at the full-employment real income level.

In Figure 3, the Pigou Effect is analyzed via IS-LM Curves: Initially, the economy is at the unemployment-equilibrium. If wages and prices are decreased sufficiently, through the Pigou Effect the economy will reach full-employment.

*Figure 3*

Decreasing the wages and prices will first shift the LM-curve to the right because of the increase in real money supply: LM'. But this will not be sufficient to provide full-employment. However, because of the increase in prices raising, the real value of liquid wealth as a second wave (or Pigou Effect), the IS-curve will shift to the right as IS' to provide the new equilibrium at full-employment ($y_F$).

Econometric studies conducted on the Pigou Effect shows that in the short-run such an effect is not encountered, and even it does exist, it is not that important or else the dynamic negative effects will not show up (Mayer, 1959; Hansen, 1951). However, Don Patinkin dealt with the Pigou Effect within an in-depth theoretical approach (Patinkin, 1956). According to Don Patinkin, within a static-analysis framework, the Pigou Effect will definitely will be observed and if the prices decrease sufficiently, full-employment equilibrium will be reached eventually ($y_F$) and the equilibrium in Figure 3 will be reached not immediately in the short-run but in a longer term. Thus, the Classical automatic full-employment equilibrium assumption seems to be correct. On the contrary, Keynes' conclusion about the impossibility of automatic full-employment turns out to be wrong in terms of static-analysis. Although this issue is being correct from the theoretical perspective, in terms of short-run policy recommendations, the circumstances are different: if in any period, the economy experiences an unemployment, decreasing the prices and wages as a policy recipe cannot be an applicable policy as it would take too long time to reach the full-employment equilibrium; prices would fall drastically and due to the dynamic effects of these price decreases for a long period of time, the employment will decrease even further. Neither the labor unions nor the entrepreneurs or even the government would like to go through all these drawbacks. And hence, in case of an unemployment problem, Keynesian policies should be implemented for the short-run. This compromise is called in economics literature "Neo-Classical Synthesis" (Paya, 1994). Maybe it was more appropriate to name it as "Neo-Classical-Neo-Keynesian Synthesis" like in the words of James Tobin.

## 5    Monetarist Approach (Monetarism) and the Importance of Monetary Policy

Monetarism was introduced by Milton Friedman as an opposing view to the Keynesian System.

The first study in Monetarism was about the velocity of money (V) being constant in the long run (Friedman and Schwartz, 1963). According to Milton Friedman, in the long run, the stability of V is more manifest than the Keynesian constant propensity to consume. But M. Friedman had introduced new principles to the Quantity Theory of Money (Friedman, 1956). M. Friedman, like Irving Fisher, has accepted for transition periods (Fisher, 1911), as V could change in a short-run the volume of money affects monetary and real parameters. But in the long-run, the effects of a change in the money supply on the real parameters disappear; as V being constant, an increase in the money supply will affect the monetary parameters only.

M. Friedman was not content with the concepts of idle and active balances of the Keynesian money demand; he dealt with the money demand in a more comprehensive way. Yet, it is possible to simplify M. Friedman's detailed money demand analysis into a simple Quantity Theory equation (Paya, 1994).

In the context of this article it is not seen as a necessity to study M. Friedman's money demand and money supply functions in detail. Money demand could be explained in summary via the equation below:

$$M/P = k(y) \text{ or } M.V = P.y$$

In the Classical System, (y) represented all goods and services produced (real income); Marshallian k or the velocity of money (V) was constant in the short-run. In Monetarism, however, (y) represents the sum of "permanent" income. In the short-run, Marshallian k or the value of V might change.

Additionally M. Friedman had identified the function of money supply entailing people's attitudes towards money and the reserve rates of banks. Government or the monetary authorities could alter the amount of the base money (Friedman, 1956; Paya, 1994).

These views of M. Friedman would have taken him to a position to recommend for the Central Bank to fine-tune the money supply, in a more appropriated base money quantity according to economic cycles. But the fact that the money demand is vague and hard to predict prevented M. Friedman from making such a recommendation. On the contrary, M. Friedman advised exactly like the other followers of the Classical Quantity Theory that the money supply (base money quantity) should be increased at a constant rate in parallel with growth rate. According to M. Friedman, the most persistent social problem is not unemployment but inflation. Inflation is a monetary event, and it is only possible to avoid it through the controlling the money supply.

M. Friedman introduced the concept of "natural rate of unemployment – NRU" in terms of employment and unemployment. This is in one respect the employment rate at which the economy experiences only voluntary unemployment rather than open unemployment stemming from the lack of effective demand. Yet, we can also add the frictional unemployment and the structural unemployment at the sectoral level to this voluntary unemployment.

In the Phillips Curve analysis, M. Friedman constructed a negatively sloped short-run Phillips Curve crossing (x)-axis at NRU-point, however, he also claimed that the long run Philips curve will be showing up at NRU-point as a perpendicular line. This is shown in Figure 4.
*Figure 4*

Let us assume that NRU is 4%. And productivity increase throughout the periods is, say, zero. In this case, an increase in cash wages ($\dot{W}$) will be equal to the increase in the general level of prices ($\dot{P}$). If the (y)-axis describes ($\dot{W}$), the short-run Philips Curve with a price increase expectation ($\dot{P}e$) of 0% will be a negatively sloped curve crossing x-axis at the NRpoint. Now, if we increase the aggregate demand via an increase in the money supply or via monetary policies, the new equilibrium will increase upwards from point A to point B in the short-run. However, as a result of this, the price increase will be, say, 3% as shown in Figure 4 (which is equal to the increase in the cash wages). In this case, workers will notice that there is a decrease in their real wages and according to their new price increase expectations of ($\dot{P}e = 3\%$), a new short-run Philips curve will be formed. Even in this case, the equilibrium will shift from point B to point C. That means it is a comeback to NRU again. As it is seen in Figure 4 (Pe = 6% etc.), this process will continue even if the government insistently creates further increases in demand. Hence, for the long-run, there will be a perpendicular line at NRU (the long-run Phillips Curve) and in this case, it will be pointless trying to decrease the unemployment rate by increasing the demand. Thus, according to M. Friedman, the equilibrium of economy could be represented in Figure 5 by means of aggregate demand (AD) and aggregate supply (AS) (Klamer, 1984).

*Figure 5*

Let us assume that the economy is at equilibrium at AD1, AS1, P and y1 where y1 represents the real income level corresponding to natural unemployment rate. Now, say that government raises the aggregate demand to AD2 level. In this case, prices as well as real income will increase in the short-run, while unemployment will decrease (the intersection of AS1 and AD2). But in the long-run, the price expectations will change and as a result of workers' reassessment of price and wage increases, the economy will end up at AS2 in the long-run. Hence, any increase in the aggregate demand will not be increase real income and employment in the long-run, it will only raise prices.

In the Philips Curve and AD-AS analysis, the underlying assumption is that the workers will correct their expectations in the next period, in other words, a turn-back from the delusion. In the first period, workers have delusion about the price increases and real wages but then they correct their mistake. This is called "adaptive

expectations". Although M. Friedman worked with "adaptive expectations" New Classical economists work with "rational expectations".

Additionally, M. Friedman refuses the efficiency of fiscal policies in terms of changing the demand, and he opposes to the Keynesian policy recipes.

As is was mentioned before in the introduction part, in terms of economic policies, M. Friedman happens to be conservative just like the old Classical economists; he is in favor of economic liberalism. Thus, the government intervention on social or other grounds will result in wrong outcomes, even backlash. That is why the government has to be small, and its budget should be balanced.

M. Friedman's monetary approach was accepted and became widespread only in 70s as a result of budget gaps that was brought about by the Vietnam War and also after 1973-1974 oil shock. Thus, for a while, in the United States (during Reagan era) and in Britain (during Thatcher era), monetarist policy recommendations were implemented. But the unemployment rate increased, and inflation was not prevented. Nevertheless, even today, both in academic circles and in political circles, beside the Keynesian approaches, the monetarist views seem to have an important weight. On the other hand, M. Friedman's emphasis on the monetary policy has challenged the Keynesian economists to reevaluate and better appreciate monetary policy. The fact that M. Friedman looks down on fiscal policy is not acceptable because fiscal policies will affect the real income level shifting the aggregate demand, and through the changes in the interest rates, they will bring about "crowding-out effect" for private investment.

## 6    Rational Expectations, Efficiency of the New Classical Views and Economic Policies

In 70s, besides Monetarism, a new and distinct anti-Keynesian view was introduced: The New-Classical School working with rational expectations. As mentioned in the introduction part, this school, pioneered by Lucas, is based on two important assumptions.

The first one is rational expectations. According to this hypothesis, all economic agents are have full access to all information, and they have knowledge about what kind of policies government will be implementing as opposed these data, and eventually they make their mind about prices and quantities taking into consideration all this information, policies and their effects. Thus, rational expectations based on these information and rationality are part of the establishment process of prices in the markets. As opposed to the rational expectations, in the theory of adaptive expectations, workers err in their cash wages in the first period, but this mistake will be corrected later. Particularly workers correct their demand for cash wages after seeing that their real wages had decreased as opposed to price increases. This process lead to a long term Philips which is perpendicular at NRU-point and to a long-run AS which is, like in Generalized Classical System, again perpendicular at NRU-point. In the Generalized Keynesian System though, the mistakes in calculations are not corrected leading to a positive slope Aggregate Supply Curve.

The second assumption is flexible prices and wages; the New-Classical economists assume that all prices and wages in economy are flexible. In this case, the equilibrium in the economy will be reached through price changes within the Walrasian general equilibrium approach. This equilibrium is full-employment equilibrium due flexibility of prices and wages; and there will be only voluntary unemployed (or rather, NRU). As opposed to the New-Classical School, in the Keynesian System, even if the prices and wages fully rigid, they are assumed to be partly rigid especially downwards. This leads to the existence of involuntary (open) unemployment besides the voluntary unemployment in the Keynesian System.

Followers of rational expectations and New-Classical School attribute the de facto high unemployment rate in economies to two important reason. First reason is that there is a "natural" rate of unemployment prevailing in the economy and the Philips Curve is being perpendicular because of rational expectations. The New Classical economists even mentioned the possibility of a positively sloping Philips Curve. The second reason of a high unemployment rate might be that the economic-agents while taking decisions might not always be furnished with full information and knowledge hence they are bound to make mistakes.

The equilibrium in the economy, according to the New Classical economists working with rational expectations, is represented in Figure 6 by means of AS and AD curves (Klamer, 1984).

In the initial period, assume that economy is at equilibrium at real income level ($y_{nru}$) at the intersecting point of aggregate demand $AD_0$ and aggregate supply $AS_0$. Now, through fiscal and monetary policies, assume that the aggregate demand shifts upward to $AD_1$. As all the individuals have full information, the AS curve will increase to $AS_1$. This way, the equilibrium real income level ($y_{nru}$) will remain the same. Lack of information and certain delays might slow down this process a bit and in the meantime the equilibrium income level could be different for a short period of time. In case individuals have full information and there are no delays, then we will be ending up with a perpendicular and continuous AS-Curve at $y_{nru}$.
*Figure 6*

New Classical School working with rational expectations reflects a stricter and limited policy recommendation regarding efficiency than the Monetarists. This is so because according to the New Classical economists, in case the government tries to implement a policy, it will be known beforehand, hence the economic agents will already be taking the effects of these policies into account while they decide on their economic activities. Therefore, any policy will be ineffective. This criticism is directed as much towards the Keynesian fiscal and monetary policies as towards the Monetarist monetary policy. In this case, in order to have efficient policies to be implemented by the government, these should not been known beforehand, that means they have to come in the form of a "shock". In fact, the members of this school led by Lucas, are very suspicious of the policies implemented by government and they prefer that government will not intervene in economic activities at all. This is so because according to them, it is very likely that the politicians may be mistaken and their motivation might be to strengthen their own political positions rather than fixing the economy (Klamer, 1984).

Systematic studies of expectations by the New Classical economists, under the assumption of rational expectations, created a buzz in 70s in the United States. Many young economists were drawn towards the New-Classical approaches working with sophisticated mathematical models. However, neither the New-Keynesian nor the Post-Keynesian economists do recognize the two fundamental assumptions of the New Classical School as realistic. According to them, it would be not likely that everybody in economy could be having full information and estimate the relevant economic policies correctly in advance and without any mistake. This would be unrealistic. In real life, there will be always some cases of lack of information or some margin of error. Furthermore, it would not even make sense trying to have full information in an environment where prices do go through drastic changes. Secondly, through full flexibility of prices and prices, all markets reaching the equilibrium through the Walrasian general equilibrium cannot be accepted as realistic either. Prices and wages would definitely rigid to an extent. Here, it is necessary to emphasize that the second of the Neo-Classical fundamental assumptions is more important. This is so because the Keynesian policies become more effective in the models which work with the assumption of rational expectations but accept rigidity of prices and wages (Phelps and Taylor, 1985).

This study would bring us to a conclusion that the Keynesian System is still valid.

# Tobin Tax in Reducing the Negative Effects of Capital Controls and Short Termed Capital Movements

Ph.D. Candidate Rahime Hülya Öztürk (Selçuk University, Turkey)

Assoc. Prof. Dr. Zeynep Karaçor (Selçuk University, Turkey)

Ph.D. Candidate Perihan Hazel Er (Selçuk University, Turkey)

## Abstract

The phenomenon liberalization, with the influence of Bretton Woods system that collapsed, following 1970 Oil Shock, first began with the efforts to search for the markets to value the investments of these countries in the developed countries. When arrived to 1980s, the developed countries, squeezed under the debt load accompanying the insufficient capital accumulation and low saving rates, in order to provide the desired capital figures, needed the foreign resources and, in this point, liberalization process of capital gained importance In realizing the growth and developmental targets of country economies, their integrating to liberalization process have a great importance. That the developing counties integrate to the system without the necessary arrangement in their financial structures made an effect in the direction of disturbing the stability of country economies, particularly in short termed capital inflows. As much as the problem created by the speculative capital inflow, the immediate outflow of this capital, disordering the balance of country economies, also caused crises. For maiming the negative influences of short termed capital, capital controls are emphasized. Just as these controls can have the various application ways, the most emphasized and discussed application was Tobin tax. Even though there are the various disagreements in the direction of whether or not Tobin tax affected the capital inflows, the examples of Malaysia and Chili gave the successful results.

## 1 Introduction

Together with the Second World War, the countries adopting the principle of capital controls of Breton Wood System, also with the effect of Oil shock in 1971, following the collapse of system and emergence of stagflationist tendencies, started the applications in the direction of removing the controls in the capital. This situation caused the globalization movement to gain acceleration and the liberalization process to form. In this period, the economic depression and debt crises the developed countries are in led these countries to adopt the financial liberalization for getting out the recession with also the effect of the financial agencies such as IMF and World Bank (Kara and Kar, 2005:96). With the liberalization policies applied, firstly, the limitations on the domestic financial markets were removed, and then, the limitations on the capital movements (Keskin, 2009). With removing of limitations, the countries rapidly integrated to the system, however, in the developing countries integrating to the system without making the necessary arrangements in their financial markets, capital inflows disturbed the stability of economy. Financial capital movements can lead to the fluctuations in the variables such as exchange rate used by central banks as main or sub-target, foreign currency reserves, monetary magnitudes, and inflation and make ineffective the monetary policy (Hoggarth and Sterne, 1997). While the capital flows going toward the developing countries satisfy the need for resource of countries, the immediate inflows and outflows of capital increased the vulnerability of country economies. In many developing countries, 1990s, when the financial liberalization movements gained acceleration, became a period, in which the important increases in the international capital movements actualized and also the severe crises were experienced, that emerge in frequent intervals and can spread easily ( Bedestenci and Kara,2004; Işık, 2005). The crises experienced led the policies supporting the marketization of the country economy to be reasoned and the views supporting the necessity of the alternative policy applications to emerge (Ay and Mangır, 2007).

The major alternative policy applications are the capital controls. In terms of effectiveness of capital controls, there is no consensus in the literature. According to the economist considering that capital controls are positive, if due to s speculative attack, a problem in the balance of foreign payment is faced and the existing arrangements cannot cope with this problem, appealing to the capital control may be a solution. The examples of Malaysia and Chili is successful in this meaning. According to the economists emphasizing the negative effects of capital movements, these controls, retarding the structural reforms, cause the existing crocked economic relationships to last. In addition, it is considered that these controls will not be effective via the derivative markets (Ankara Sanayi Odası, 2001).

Among the policy applications suggested, the most remarkable one was Tobin tax, put forward by Tobin. This tax, is ad valorem tax, which, in the first studies of Tobin, was brought into the spot foreign currency buying systems, is considered to be between 0.1% and 0.5 %, and in his next studies, which can be expressed that it can rise until 1% (Yılmaz, 2004).

## 2 Capital Controls

Capital controls is the official arrangements affecting the international capital movements (Vergil, 2002). Capital controls, implemented in the extraordinary situations such as 1st World War, Great World Depression, and 2nd World War, following the last war, in both Eastern and many Western counties, together with becoming popular of central economy, it became one of the main instruments of the economic policy (Keskin, 2009). International capital flows enter and go out the national economy through very different ways and the uncertainty and risky environment form an appropriate environment for the capital controls. Against these negative economic effects resulted from the capital movements, capital controls are every kind of policies the country applied, in order to limit the transactions of capital account or direct (Neely,1998 ). The especially remarkable and discussed application in capital controls is Tobin tax.

Magud and Reinhart (2007) define the four fears for capital controls.

- The fear about valuation of exchange rate.
- The fear of "hot currency"
- The fear of high volume capital inlet
- The fear of that the independency of monetary policy will be lost

Johnston and Tamisira (1998) put in order the reasons for capital controls as follows.

- Payments balance and macro management
- Market and institutional evolution
- The cautious policies
- The size and openness of economy

Capital controls are emphasized in two ways, directly and indirectly.

In direct capital controls, direct limitations are brought into the capital transactions and payments related to these transactions, and transfer of funds via the apparent prohibitions, quantity limits, and approving mechanisms. The limitations about the relevant sort of capital are carried out by imposing on the banking sector (Ariyoshi et al, section 1, box 1, 2000).

Indirect capital controls are preventing the capital inflows by increasing the costs of financial transactions providing the capital movements. They are applied as multiple exchange rate system, open taxation, indirect taxation.

Multiple Exchange Rate System: In dual exchange rate systems, for the transactions of current account such as import and export and for the transactions of capital account forming as a result of capital flows, the different exchange rates are applied. Multiple exchange rate system is generally applied during the crises of payments balance. While the part of this system running in the way of fixed exchange rate is protecting the trade operations from the movements of exchange rate, its part running in the way of floating exchange rate system, moving according to the supply and demand in the market, provides the economic sectors with flexibility in the applications of monetary policy (Fan, 2004).

Open taxation (Tobin tax): In this application, it is obligatory for the bank or non-bank financial agencies to hold the foreign currency that equals the determined rate of net exchange position or capital that equals to the domestic currency equivalent of this total in the central bank of country without interest. This kind of control is applied to both capital inflows and capital outflows.

The application difficulties of capital controls can be put in order as follows.

- If the capital coming to country is reported as a sort of capital to that the control are not applied, it means to bypass the relevant controls.

- In the capital control, as the tax rates, time to hold capital, and exception number increase, the complexity of the system also increases.

- It is necessary to continuously update the content of capital control application, in order to prevent from bypassing the control; however, this situation increases the costs of applications (Kokenyne et al, 2010).

- Since capital control significantly affected the system, it causes the financial system to slow during application:

Capital controls are used as an instrument in preventing the financial crises. For preventing the formation of crises, the different polices are also applied.

## 3 The Policies Applied for Preventing the Emergence of the New Crises

From the view point of not emerging of the new financial crises or not becoming deeper the crises that may arise, the actions to be able to take in the foreign currency market can be discussed under the following headings (Birinci, 1998).

- Taxing the transactions (Tobin Tax)
- Fixing the exchange rates or determining the limits of exchange rate
- Application of multiple exchange rate
- Increasing the international banking audit, impeding the capital escape
- Trading halts applications (closing the transactions markets in the crisis environment)
- Establishing the international alarming system
- Increasing IMF quotas
- IMF warranted borrowing easiness
- Organizing the financial movements in the framework of a process similar to GATT
- Target zone system (via international cooperation, preventing the unrealistic exchange rate variations).

The other suggestions are (Eğilmez, 1999: 41);

- Transforming Interim Committee (Interim Committee of The IMF) into the executive council
- Bounding the international system to the rules that ate in international validity
- Transforming G-7 into a decision body in the form of G-15, including the developing countries (J.Sachs, 1999)
- Rescuing IMF from the press of USA Treasure, restoring an independent structure (J.Sachs, 1999 )
- Completing the financial sector reports in all countries
- For the struggle with corruptions and better and transparent public administration, making worldwide attempts
- Establishing an international debt panel, enabling the various countries to perform their debt reliefs through this panel

In reducing the negative effects of capital flows, the alternative policy applications are putt in order as follows;

- sterilization of capital flows
- application of more flexible exchange rate
- capital controls
- tight fiscal policies
- tightening the monetary policy in response to capital escape
- fortifying the banking system

## 4 In Reducing the Effects of Short Termed Capital Movements, May Tobin Tax Be a Solution?

Global capital movements are examined as indirect investments, short termed monetary capital, central and fiscal funds, speculative fund flows, and laundering the money.

Foreign capital investments are collected in two groups. One of them is the portfolio investment, in other words, hot money; the second is capital to be brought in the way that it will increase the production capacity of country. Portfolio investments are short termed. This kind of investments very rapidly leave the country at the moment of a crisis and become deeper the dimension of crisis (Acar, 2003).

When the controls are removed on the capital movements, there occurs a capital inflow toward the developing countries. The reason for this, with the rise of interest rates in the developing countries, is that they rise up average of the world. Since this also means a profitable investment for the foreign investors, a capital flow occurs toward the developing countries. The relationship between the short termed capital movements and exchange rate occupies an important place in shaping of financial crises. In the conditions of floating or free exchange rate or in the conditions of fixed exchange rates exposed to often changes, it is possible to avoid the risk of foreign exchange. If one can avoid the risks of foreign exchange, the short termed capital movements cannot occur. Since the risks of foreign exchanges are consciously undertaken, when the short termed capital movements occur, these provide the stability and become an element of instability (Kindleberger, 1970).

Capital flows becoming free, under the press of the profit rate to fall, provides the capital escaping from its own land with higher return. In the counties it goes, especially in the developing countries, whose financial markets are vulnerable, it becomes source of a great fiscal instability, accelerating the speculative movements, leads to the crises.

Interest arbitrage includes very short termed capital movements and portfolio investments, because, theoretically, the differences between international interest rates domestic interest rates largely cause the short termed capital movements (Işık-Duman-Korkmaz, 2004: 59).

There are three main features of speculations. First is that there is a descent of a rise and that speculative rises conclude with a collapse. The second one is that there are losers in response to the winner and in a general sum, is that the case that no income can be created via speculation. The last is, in the real production sectors, when the profitability rate of capital decreases, that the speculations gain intensity and that demands for fund is created.

Black money, very generally, is the value of every kind of property, expressed income and money obtained by offending. The identity and citizenship of the funds that enter and leave the countries in the form of fluid funds is uncertain. Liberalization of capital movements accelerated the formation of black money. Some part of unrecorded economy is related to the common but local practices of the recorded firms such as tax evasion, not paying for social security premium, and understating the number of wage of workers. Some part of it consist of the crimes such as arms smuggling, drug trafficking, terror financing, and winning international tender by corrupting, in which the people of a number of globalizing country are included. The size of its dimensions made a current issue that these black money sourced funds must absolutely find a way to gain favor and to be cleaned and the important role in the financial crisis especially experienced in the developing countries (Kazgan, 2005).

In 1972, James Tobin, in his book, in order to reduce the negative effects of short termed capital movements, gave place a suggestion. This suggestion is that a single type of transformation tax that will be collected in the spot markets, where a foreign currency is converted to another one, will prevent the circulation of short termed capital movements. As far as James Tobin disturbed that international transaction tax, suggested by himself turned into opposition to globalization, this precaution placed in the first rank of the suggestions about impeding the short termed capital movements (Akdiş, 2004). Tobin suggests that the tax offered by him should be applied to all financial instruments. According to Tobin, this tax should be applied in in case that a currency unit purchases the good, service, and real estate in the region, where another currency unit is valid, This offer of Tobin identifying with the words of "throw sand in the wheels" includes to impose tax to the short termed and high summed capital movements that disproportionally actualize in the global exchange rate markets (Westerhoff, 2003: 2). James Tobin suggested to apply a tax that includes foreign currency exchange and that will affect all international foreign currency transactions. The tax of interest will come into play in both buying and selling whatever the aim of transactions is. At the beginning, it was considered that this tax should be applied in only current market, but the multiplicity of dodges in the current market revealed that the tax should encompass all markets (Ciritçi, 2004: 57).

| Countries | Year | Reason | Control mechanism of capital movement | Results |
|---|---|---|---|---|
| Europe and Latin America | 1929 | 1929 Economic depression | Foreign currency controlled | Successful |
| ABD | 1960 | Depending om the tendencies, in the direction of liberalization, that capital outflows are experienced | Levying the tax on the capital outflows – tax on equalizing the real interest rate | Partially successful (It has no remarkable effect in reducing speculation ) |
| Israel | 1996 | Limitation of capital inflows to the country | Levying the tax on the capital inflows | Partially successful (It has no remarkable effect in reducing speculation ) |
| Malaysia | 1998 | 1997 Asia Crisis | The controls made on the outflows of capital - limitation of Malaysian citizens to invest capital abroad and stopping the inlet of foreign investments for 12 months | Successful |
| Chili | 1978-1982 1991-1998 | Banking Crises | Controls on capital inflows - imposing the non-profit reserve deposit obligation om the portfolio investments | Successful |
| Brazil | 1998 | 1997 Asia Crisis | Control of capital outflows – transaction tax - imposing General Transfer tax om banking transfers in the rate of 0.25% | Unsuccessful |

*Table 1. World applications toward controlling the capital movements in the selected countries, World applications toward controlling the capital movements in the selected countries, Source: Fatih Mehmet Citations in the text Öcal, 2012*

It is considered that Tobin tax is collected through the transactions of foreign currency exchange in a single and very low rate according to ad volerem base. Tobin himself these can be in the rates of such as 0,2% , 0,5%, and 1%. Tobin, suggesting that the financial crisis rising in Asia demonstrated how volatile foreign currency

exchange system is, expressed that a global tax to be able to levy through foreign currency exchange is one of the probabilities to solve the problem of excessive volatility (Akdiş, 2004). Provided that the scope of Tobin tax can be extended in such a way that it will include at least the markets of future options and swap, it will always be possibilities to avoid this kind of taxes. When compared to the development of spot markets, the derivative markets, in the recent years, show a rapid development all over the world. This situation forms a reason for including the derivatives transactions in the scope of tax. When the tax is imposed, with the thought that the new financial instruments can be invented, which are not included in the scope of tax, it will be necessary to extend the scope of tax in such a way that it will include the sorts of security and derivatives market instrument to be able to emerge further (Yılmaz, 2002: 9 ). In the application of Tobin tax, the transactions of foreign currency exchange of national states, central banks, and international official organizations and very small sized transactions are exempted from Tobin tax (Patterson and Galliano, 1998: 29). In addition, the regions of monetary union is in the scope of exemption.

In Table 1, a summary of capital control applied in the world is presented. According to the Table, the applications of Malaysia, Chili, Latin America countries, and Europe became successful, Brazil successful, and USA partially successful

| Supporters | Opponents |
|---|---|
| That it brings the stability to the international finance market, preventing the speculative monetary movements | With that it serves as a short termed monetary policy instrument, that it is not an effective instrument in eliminating the economic instability |
| With the struggle with instabilities the speculative capital led to, its fortifying the internal resources of the country | Its negatively affecting the development of financial markets in the developing countries |
| With reducing the rate of Tobin tax according to the maturity, encouraging longer termed foreign capital | With that the short termed capital leaves the country, increase of budgetary deficits |
| Obtaining tax income and using this income for regulating international markets | Since Tobin tax, depending on the technical and political differences, cannot be simultaneously applied by all countries, that the foreign capital goes toward the tax-free transactions and the countries that ate tax heaven |
| With preventing the speculative capital movements, providing the stability in exchange rates and interest rates | Since Tobin tax does not satisfy the expectations of governments in case that the lower tax base forms, the fact that the tax incomes below that hoped |
| That IMF and World Bank provide the resource for the international stability programs and solution of social problems of the world | The thought that the taxes to be applied toward the capital movements will deviate the financial markets; direct the investors; and keep the financiers out of the economy and sector or shift them to the regions exempted from tax |
| Together with the increase of short termed capital transactions, making the foreign investments in the long period, and depending on this, stimulation of the real sector | That makes the variable tax rates, tax accountabilities, and responsibilities on the tax administration complicated and that such a tax imposed om the capital movements reduces the effectiveness in the market |
| Inserting the transactions of multinational companies that are left out of tax to the scope of tax in an international platform | In case that with tax, the short termed capital movements decrease, constriction of trading volume; and with increase in the volatility, that exchange rate cannot realize the commercial gains |
| With Tobin tax,  that the governments are rid of the press on the country currency and that they can more easily the economic policies | That the size of additional charge to be put on the transactions is not well calculated and depending om its high taxing, its raising the transaction costs and reducing the trading volume; and its negatively affecting the long termed investment |

*Table 2. The views on Tobin Tax, **Source:** Fatih Mehmet Öcal, 2012*

In an alternative way to Tobin tax, some polices are suggested. These are:

- Taxing Foreign Securities
- Taxing the Capital Inflows and Outflows
- Taxing the Capital Gains

There are some points that are dominant in the application of Tobin tax. These are: /Patterson and Galliano, 1998: 29)

1. As the number of foreign currency exchange transactions increases, the effective tax rate increases.

2. Tobin tax will not make all speculative transactions non-profit and impossible and will only raise the rate of risk.

The possible benefits of Tobin tax (Halifax, 2003)

- With the decrease of transaction volume in the foreign exchange markets, the volatility of foreign currency will fall and stability will mobilize the trade of goods and services.

- This tax will provide a financial support in the runs between economies. The possible damages of tax are put in order as follows.

- Application of such a tax serves as an instrument of only short termed monetary policy (Spahn, 1996: 8)

- For being able to apply a tax, it will be necessary to make an agreement with each financial center in the world; otherwise, the foreign currency markets will go toward the tax –free transactions and the countries, tax heaven (Raffer, 1998: 534). That such a tax is simultaneously executed by all countries is not applicable from the technical and political point of view (Edwards, 1999: 2).

- Applying such a tax will bring a bureaucratic charge to the market, in which $1 – 1.5 million is revolved.

- Another issue is that taxing the foreign currency transaction will be able to switch the direction of international capital to the derivatives markets and it will go toward the commercial papers and acceptance of banker (Spahn, 1996:2).

- If the exchange rate is face to face with the speculative stocks, speculators, considering the tax charge on the transactions they carried out, will move and this will be able to increase the volatility rather than reducing.

In the literature, there are some views supporting and opposing Tobin tax. Table 2 includes the views on Tobin tax.

## 5  Conclusion

Integration of financial markets and the developing countries are caught unpreparedly to this integration made the country economies vulnerable. Especially, using the short termed capital movement with the speculative purposes increases this vulnerability and creases an effect disturbing the financial stability. For reducing the vulnerabilities of economies and making them less sensitive against the capital movement, a lot of precautions were emphasized. The major one among these precautions is capital controls, while in the capital controls, the most emphasized and discussed was Tobin tax.

James Tobin suggests an ad valorem tax in order for the capital to stay for long term in the county it entered. This tax expresses a lower rate such as 0.2%, 0.5%, and 1%. This tax of lower rate, when considering the size of trading volume, corresponds to a large amount in the way of not being able to ignore.

Malaysia and Chili, with the limitation they bought to the inflows and outflows of capital, managed to provide the financial stability. The tax does not affect the long termed capital outflows and only aims to constrain the short termed capital inflows. The major criticism brought to Tobin tax is bureaucratic charge and international capital that will go toward derivatives markets. The economic crises experienced by the developing countries showed that that the economies include in the financial markets without making the necessary preparations makes an effect disturbing the stability. What should be done is to include in the financial system without disturbing the economic stability. The way of realizing this is that the financial markets become deeper and develop. If it was integrated to the system without providing this deepening and development, the vulnerability of economy becomes unavoidable and it is moved to the searches reducing the vulnerability. The capital controls are the leading one of these searches. The capital controls stand out as an important instrument in reducing the effects of capital movements.

# Transaction Costs of Large and Mid-sized Corporations in Russia

Assoc. Prof. Dr. Ekaterina Nikolaeva (Chelyabinsk State University, Russia)
Assoc. Prof. Dr. Dmitri Pletnev (Chelyabinsk State University, Russia)
Stanislav Lushnikov (Chelyabinsk State University, Russia)

## Abstract

In the times of economic instability in most developed countries, a decrease is experienced in the effectiveness of many large public corporations. Such corporations are facing high expenditures (transaction costs mostly) and extremely low return on invested capital. Medium-sized businesses, on the contrary, prove to be more efficient: they show an acceptable level of profitability and total cost savings. The purpose of the present study is to calculate and analyse transaction costs of medium and large corporations and identify an impact of these costs on the performance of companies. Within the the framework of a neoinstitutional approach a complex of institutional factors influencing a company's development is being explored. The efficiency of institutional forms is determined through studying such factors as transaction costs. In line with this theory, the transaction cost level of corporations is estimated, which enables one to make their comparative analysis in economic sectors. The analysis has revealed that the relative level of transaction costs with large corporations is two times higher than that in the event of middle ones. A comparative analysis of return on sales in two groups of companies has pointed to a fact that after 2010 the margin of middle-sized companies exceeded the profitability of large companies. The relationship between the level of transaction costs and return on sales in two groups of companies is being quantified as well. We have proved that middle-sized corporations have shown a direct relationship. On the contrary, transaction costs negatively affect profitability in large corporations.

## 1 Introduction

An insufficient attention in economic literature is being paid to the issue of the ratio between the efficiency of a firm and its transactional expenses. Besides, it is necessary to note that this aspect of the analysis is, as a rule, one-sided. The majority of theorists studying transactional expenses and the institutional nature of a firm speak about a need of decreasing transactional expenses for the purpose of increasing the efficiency of a company and of transactions carried out by it. However, it is possible to adduce a set of examples when a company that increases the transactional component of its expenses and achieves thereby a considerable expansion of sales markets, an elimination of competitors and an access to cheaper resources. And in this regard, according to some authors, there arises a question of a correlation of obtained benefits and expenses incurred.

In papers devoted to the research of transactional expenses, these expenses are classified as a set of methodsd. Among them there are the following: a division into internal and external, constant and variable, obvious and implicit costs. In addition, at least 10 types of transactional expenses preceding or following a transaction are singled out. Therefore, in our opinion, a choice of a variant of optimising transactional expenses should be made separately with respect to their specific kind.

Many authors in their articles examine the key questions relating to transaction costs in modern companies. They considered the problem of transaction costs in the industry, time and intercountry context (Langlois, 2005; Schmitz ve Patrick, 2006; Pessali, 2006; Bylund, 2013; Powell, 2014).

## 2 Metodology

Modern corporations are characterised by a variety of forms and ways of conducting economic operations, which, in its turn, also defines a variety of expenses of transactional nature. The types of transactional expenses which have been the most fully described above, are represented in large and average corporations. Big transactional expenses, as a rule, arise in large corporations characterised by big turnovers and considerable profits. In modern economy, high expenses of transactional nature are mainly external and they themselves are subsequently accompanied by considerable benefits for a corporation (for example, costs of lobbying in the interests of a corporation). Internal transactional expenses associated with ensuring the effective functioning of intra-corporate institutions also take place, but most commonly not in such a volume, and a corporation does not expect such considerable benefits from them (for instance, expenditures on the simulation and creation of the most optimal organisational structures).

Nowadays, in Russia and abroad a considerable attention is being paid to the research of medium and small business. In the period of the recession in economies of the majority of developed countries a decrease in the efficiency (often resulting in losses) of large public companies is being observed. Such corporations are becoming unable to meet expectations of investors, quite often showing an extremely low profitability on invested capital. In this regard, large companies, even during especially difficult periods, see a growth of expenses on remunerations of top managers, on advertising, as well as on financing illegal operations and

projects, which allows lobbying interests of corporation in political circles. In connection with this driver, an escape of economy from the crisis situation and a further sustainable development is seen by many economists in the development of medium business.

Large corporations are, as a rule, highly integrated companies which, apart from this fact, widely utilise outsourcing, network structures, which fact, unlike smaller structures, enables them to get additional benefits, including those obtained from decreasing transactional expenses. However, parallel to this, such companies bear a high burden of transactional expenses connected with the maintenance of corporate structure.

Thus, K. Verner and G. Weiss's book (Verner ve Weiss, 2007) describes the largest and most effective multinational corporations, such as Adidas, Bayer, Coca-Cola, Deutsche Bank, The Walt Disney Company, Kraft Foods International, McDonalds Corporation, Procter&Gamble and many others. Most charges brought against leader corporations are economic and social nature, such as: evasion of tax payment, use of child labour, violation of rules of commodity sale, environment destruction, speculative transactions, carrying out experiences on animals, repressions of members of trade unions, setting obstacles to sale of vital medicines in developing countries, extreme forms of exploitation at Chinese factories, dumping, etc. Apart from that, political charges are brought against a number of corporations working mainly in the sphere of production and sale of oil products, banking services, political: financing military operations in developing countries, cooperation with military regimes, granting credits for roguish projects, lobbying against actions aimed at protecting climate, etc.

Whatever violations may be considerd, it is quite obvious that the majority, if not all the largest corporations, commit them for the purpose of capitalising on the following: expansion of sales markets, suppression of competitors, cost avoidance. Owing to this the efficiency of these corporations increases. A conclusion suggests itself that illegal economic, social and political actions allow corporations to remain competitive in the world's markets. And those who are not members of this "club" of shadow economy players are compelled to be content with the least they have or withdraw from the market.

From the description of transnational corporations, given above, it follows that the majority of actions (of illegal character) is directed towards an expansion of sales markets and a decrease in production expenses, for which purpose corporations endow huge amounts of money (transactional expenses) in the form of bribes, penalties, financing investigations, etc.

An empirical analysis of data of western transnational corporations has showed that while having huge turnovers these corporations get a rather low margin of profit. That is to say, when deciding on employing illegal measures for the sake of achieving their goals, by no means all corporations achieve considerable benefits.

Medium business is represented by closed (nonpublic) companies, often family ones, with one or several owners. The main advantages of such companies, which favourably distinguish them from large business, are as follows: ability to discern a long-term prospect, a high level of responsibility, and trust, and flexibility in decision-making. In the period of a crisis, the least-effort principle becomes predominating in such companies, which helps them not only remain "afloat" under conditions of competition, but also show quite a good profitability. It is necessary to note that economising occurs largely at the expense of a constant component of expenses, to which a considerable part of transactional expenses exactly relates.

An analysis of medium business in countries of Europe has showed that there is a multitude of quite effective companies, part of which has an access to the world's commodity markets, and parallel to this they do their legal business. G. Simon's books "Hidden champions" (Simon, 1998, 2007) describes middle-scale companies which are world leaders in their areas and which are successful and profitable thanks to their high intellectual concentration in their work with clients, a lack of extensive expenditures on promotion and advertising. These companies posssess unique structures and principles of management. Among them there are Baader, Webasto, Stihl, Brita, etc. One of the most important characteristics of these companies is their narrow specialisation and concentration in a certain grocery niche. It enables companies occupy upto 70-80% of the market, which can be comparable only to large transnational giants. As a rule, these are companies with a turnover of upto 300 thousand dollars, having specialised business in various branches – mechanical engineering, metal working, chemical, food, electronic industry, etc.

Unlike large corporations, average ones avoid joining alliances and use of outsourcing in their production and research activity. Production depth (the percent of production operations carried out by firms) makes up about 60%. A share of a value added in revenue is more than 50%, and companies note that a profit level is above an average.

Thus, medium corporations actively use factors of economising on transactional expenses and demonstrate their high efficiency. Having refused that institutional structure which the largest leader corporations have and having victimised part of their turnover, a company can entirely switch over to a more effective model of doing business. In this respect, probably there will be no need in using shadow schemes and companies will be exempted from huge expenditures on making illegal transactions.

## 3   Results

Russian medium business has some features which, unfortunately, do not testify to its advantage. The historically formed features of Russian economy and of the private sector disclose a number of problems about which it was stated in a report by the PWC company regarding an investigation of private and family business (PWC, 2012). Among them the following challenges are noted: an insufficient support from the state, disinterest of the state in such companies (as small taxpayers), a lack of tax privileges, an existence of high administrative barriers (checks on the part of various agencies, complicities faced during registration, etc.), an absence of highly qualified specialists in a number of branches. However, despite the above-said difficulties, there are many highly effective and successful representatives even among Russian companies of medium business.

As already noted, transactional expenses are capable to have an impact on the efficiency of a company. As a rule, it is considered that there is a reverse interrelationship between these indicators: the higher are transactional expenses, the lower is efficiency. However, the author believes, what not all transactional expenses equally "adversely" influence the efficiency of an enterprise. Thus, Popov E.V.'s works (Popov, 2010) prove a direct dependence between transactional expenses and profit by means of a transactional function.

In the course of the research of transactional expenses, we employed indicators of accounting reports of some companies of Russia's food industry, which are sufficiently presented both by large and medium-sized enterprises. For the purpose of analysing the influence of transactional costs on efficiency of companies, a level of transactional expenses was defined, profitability of sales was calculated, and an analysis of their interrelation was carried out, using an authorial technique, In the course of the research, of companies were attributed to two groups – large and medium, according to a disposal of goods indicator.

An indicator of the level of transactional expenses does not reflect their actual volume in a company - the accounting of all arising transactional expenses is extremely difficult - but is an aggregated relative indicator enabling one to compare transactional expenses of certain economic entities. In order to assess the level of transactional expenses, the author uses data of accounting reports of companies. Out of these records the calculation includes both factually incurred expenses (for example, business and other expenditures, etc.) and relative indicators which indirectly indicate an existence of transactional expenses (the duration of a turnover of assets, a share of reserves in assets). In greater detail, one may read about the technique of assessing the level of transactional expenses in Nikolaeva E.V.'s works (Nikolaeva and Pletnev, 2009).

As a result of the analysis, a proposed hypothesis stating that the level of transactional expenses in large corporations is higher than in medium-sized companies was confirmed. This testifies to high expenditures on the part of large companies on the implementation of their operations. Besides, it was revealed that the level of transactional expenses decreased with the majority of companies in 2009, and after that medium-sized companies demonstrated an increase of the level, while large ones showed a decrease of the same. However, despite this fact, the level of transactional expenses of large companies throughout the whole studied period (2004-2012) practically twice as much exceeded this indicator in the event of medium-sized companies.

***Figure 1.*** *Levels of transactional expenses of large and medium-sized corporations in the food industry branch during 2004-2012 (unit costs)*

Further, we have compared efficiency indicators (profitability of sales) for the studied companies from the two groups. The value of profitability of medium-sized companies was insignificantly lower than the similar indicator in the event of large companies (by 2-3%). And on the average, this indicator did not exceed 9% for the branch in the studied period. After 2010, profitability of medium-sized companies somewhat exceeded that of large companies, which may testify to the fact that medium-sized companies got out of the crisis more successfully.

*Figure 2. Levels of profitability of large and medium-sized corporations in the food industry branch during 2004-2012 (Rate)*

In the paper, the interrelation between the level of transactional expenses and profitability of sales in two groups of the studied companies was quantitatively determined. As a result of a regression-and-correlation analysis, it was revealed that in case of large corporations – leaders in their branch – the interrelation between indicators is reverse, that is to say a growth of transactional expenses has an adverse effect on profitability indicators. In the group of medium-sized companies, some reverse results were obtained – a growth of transactional expenses is accompanied by a profitability growth. Thus, it is impossible to draw an unambiguous conclusion regarding the necessity of decreasing transactional expenses of companies. Possibly, with a reduction of part of similar expenses the efficiency of a firm's activity will decrease too. And if one takes into account the fact that medium-sized companies generally incur only the most necessary expenses, then it is probable to assume that these are the very transactional expenses without which the efficiency of a company will fall. On the other hand, large corporations often "inflate" the budget of their expenses on non-productive needs, which tells negatively on their results.

In our opinion, the very form of ownership and the size of a company play an important role in the formation of the structure of expenses, which further determines the size of profit. In companies, where property and supervision are not separated (as a rule, in medium business), the existence of market competition stimulates managing directors to economise on expenses. But in large corporations (especially public companies) a lack of rigid supervision on the part of owners demotivates managers to decrease expenses. As a result, such corporations show efficiency at the level of medium-sized companies, in this case they bear twice as big transactional expenses alone (and this is so even without considering that share of incomes, which hired managers stow away "in a shadow"). Barkhatov V. and Pletnev D.'s works are devoted to the study of the theory and practice of the development of institutional environment in Russian corporations, as well as to the issue of their efficiency (Barkhatov, 2011, Pletnev, 2013).

## 4   Conclusion

By way of summarising, we have singled out a number of factors influencing the volume of transactional expenditures of large and medium-sized corporations in Russia and abroad.

In large corporations, considerable transactional expenses arise due to a need of implementing the following expenses:

- enormous expenses on marketing and advertising;
- expenses associated with an entrance of companies to stock markets;
- high costs of maintaining institutions of corporate governance;
- high expenses on hiring and personnel training;
- costs of making illegal transactions (by managers both in relation to a corporation, and with regard to the state and society).

Unlike large corporations medium-sized companies economise on transactional expenses for a number of reasons:

- companies incur rather low expenses on marketing;
- companies do approach the stock market and have no expenses connected with it (besides, this reduces risks of unfriendly take-overs);
- companies strive to draw highly qualified specialists and maintain low turnover rate of personnel, therefore expenses on hiring and training of personnel are low;
- low costs of corporate governance.

Thus, representatives of medium business actively use economising factors with respect to transactional expenses and demonstrate an efficiency at the level of large corporations which, in their turn, are compelled to bear a huge burden of expenses for maintaining this level.

# EU Innovation Performance Policies and the Economic Crisis: Innovation Policy and the Political Failure of Italy

Dr. Marco Boschele (Yeditepe University, Turkey)

## Abstract

At EU level, measures to promote research and innovation became concrete with the creation of the European Research Area and the issuing of the White Paper on Governance in 2001. These were measures to tackle low economic growth and unemployment and to boost European innovation with the aid of science and technology. Nevertheless, the economic crisis of late 2008 has halted this process and exposed the lack of convergence across European and neighbour countries in innovative performance. Moreover, economically more affected countries have abandoned innovation policies as part of the austerity policies precisely dictated by the EU bureaucrats. This paper first discusses the EU policies towards the creation of the knowledge society and the effect of the crisis in relation to research and development. Secondly, the paper will analyze the case of Italy and how it has failed to keep up with some of its other European neighbours in terms of investment on knowledge, arguing that lack of such investment make countries less equipped and more dependent on knowledge generated in other places.

## 1 Introduction

Measures to promote research and innovation became concrete with the creation of the *European Research Area* and the issuing of the *White Paper on Governance* in 2001. The intent was to lift the EU, as an economic area, to the level of US and Japan in terms of competitiveness and innovation matching scientific performance with technological and industrial results, known as the *European paradox*. The *Community Method* was introduced to improve research framework and the *Framework Programme* was employed to promote greater science and technology collaboration and coordination. New understandings of society, as the result of the growing importance of *information* and the production and usage of *knowledge* in the 1990s, influenced the Commission approach.

The idea to invest in knowledge and research to promote innovation and therefore, the transition to a knowledge society, was first conceived at national level. In Finland the Science and Technology Policy Council published reports on the *innovative society* in 1993 and on the *knowledge-based society* in 1996. In the UK a report was published on how to benefit from the processes of privatisation and marked based reforms but lacking in competitiveness was published in 2003. In France arguments were proposed about the *new economy* and looked at the USA Information and Communication Technologies developments with the help of research and development, financing mechanism and deregulation of old monopolies. In the Netherlands an *innovation platform* was launched in 2003, the mission of which was to strengthen the innovation potential to secure a leading role for the country in the *European knowledge economy* of 2010.

Relevant, within this context, are the theories which attempt to understand the transformations within contemporary societies which begun in the 1960s and 1970s. Some argued for the emergence of new ways to understand contemporary societies with the central role of information and knowledge in society at least for the past forty years (Castells 2000; Sörlin and Vessuri 2007; Webster 2007; Fuller 2002; Lash 2002). The seminal work of Müldür and Caracostas, Society the Endless Frontier (1998), often considered as the blueprint for the FP6, pick up these theoretical changes and set the basis for the role of science and technology for the improvement of society. Many social scientists have recognised US, Japan, Britain and Germany as information societies and thus the EU urging for adjustment to the global information society.

An important factor for competing in the global economy is the investment in knowledge based capital. Investment in knowledge has been rising in many OECD economies because such an investment can be a source of return to scale in production and some of the knowledge such as research and development can also influence other parts of the economy.

However, it is argued that the lack of convergence of innovation investment can affect the cohesion process within the EU because of making less equipped countries dependant from knowledge produced elsewhere and at the same time put these countries in a less advantaged position to obtain such knowledge. This may be the case of Italy if we consider its poor performance in investment which pre-dates the international financial crisis, but also the effects that the crisis has had on innovation policies due to the austerity measures partly imposed by Brussels in order to contain the country public debt.

In the light of the EU policies, this paper will first acknowledge the recommendations of the White Paper on Governance of 2001, specifically issued to try to level the gaps of more diverse countries in terms of innovation and technological development, and the effects of the crisis on such measures. Secondly, it will be discussed the

inclusive/exclusive character of the knowledge society and the situation of Italy as a potential excluded country from a possible knowledge society at EU level.

## 2   EU and the Development of Innovative Performance Policies

At EU level, in the light of the societal challenges at the end of the 1990s, policy makers, at The Lisbon Council of March 2000, assessed the strengths and weaknesses of the EU. Strengths were macro-economic prospects, growth and job creation, but the weaknesses were the development of key sectors and human capital formation. There was low employment rate, low participation in the labour market of women and older workers, and market regional unemployment disparity across the Union. A report on the socio-economic research activities 1998-2002 exposed the challenges of assessing the social and economic aspects of the European Research Programmes because of 'lack of commonly agreed definitions, consistent dataset and robust assessment methods.' This was an assessment of the socio-economic importance of FP5. The report analyses the Key Action role to improve the socio-economic knowledge based with the main themes as sated above. This part of the programme focused mainly on social sciences and one of the concerns was to prepare the research community to work effectively within the ERA and help the transition to the FP6. Amongst the objective was that of strengthen the contribution and the structuration of the social sciences and the humanities in the ERA. Due to the state of the state of social science research, largely performed at national level and by individual researchers one of the challenges of FP6 was the ability to collaborate within a large community of researchers.

The creation of the European Research Area was proposed in the year 2000 by the Commission Communication which stated that the 21$^{st}$ century would be a century of science and technology and investing in research and technological development was a must for the future. The communication also pointed out the necessary conditions to increase the impact of research though the coordination of research and policies in Europe. The March 2000 Lisbon Council set the objective and implementation timetable and the resolution for the European Council called on the Commission in cooperation with the member states to present objectives and methodologies to articulate excellence in all member states and coordinate science policy (Patricio 2004:53).

The European Research Area communication and the EU White Paper on Governance were an attempt to provide the necessary ground for closer relationship also between social scientists and policymakers.  In the context of these new approaches there were the political transformation of the EU due to the enlargement and the efforts to make the EU more democratic.

The reasons for the creation of the knowledge society at EU level were first felt at national level in Europe particularly in Northern European countries which saw in technology and innovation a way to economic growth. At EU level is crucial the Lisbon Strategy and the subsequent creation of the ERA and the inclusion of the social sciences. It was acknowledged that knowledge was plying an important role for research, innovation and education. As an instrument for the generation of knowledge the social sciences were included in the FPs to deal with the challenges including economic and political integration, economic growth and large scale migration faced by the EU and member states. The creation of the ERA and the various attempts at EU level to coordinate research also in the field of the social sciences and the relation with the policy making process with the techno-science approach can be seen as an approach to give more legitimacy to the EU policy process through the generation of scientific knowledge.

## 3   Innovation Policies and the Economic Crisis

Archibugi and Filippetti (2011) argue that the lack of convergence of innovation investment can affect the cohesion process within the EU because of making less equipped countries dependant from knowledge produced elsewhere and at the same time put these countries in a less advantaged position to obtain such knowledge. In fact the White Paper on Governance of 2001 was specifically issued to try to level the gaps of a more diverse in terms of innovation and technological development.

Another factor, however, which can aggravate this gap in knowledge across the EU, is the effect of the economic crisis on investment in research. According to a study from the Directorate General Research, the impact of the crisis on the real economy has diminished some aspects of investment in research particularly in new member states. For instance, research and development expenditure has diminished in Italy, Hungry, the Netherlands, Ireland, Slovenia and Slovakia. In Italy and the Netherlands public expenditure has not decreased in other public sectors. This means that research and development public expenditure in these countries is not a priority like in others, particularly Northern countries such as Finland and Sweden. In fact the 2010-2013 GBAORD of countries such as Italy and Spain but also UK and the Netherlands have changed in a negative way. This negative trend is also followed by decreased in higher education expenditure since 2009, which together with negative net-migration and brain drain can worsen the situation of human resources (Izsak et all 2013).

In order to show the changes that the economic crisis caused, it is also useful to see the division of EU countries into four groups, according to innovative performance. *The Parvenu*, including Poland, Slovakia,

Lithuania, Bulgaria, Romania, Slovenia, which although they do not have a previous tradition of national innovation system, they have increased their investment; *the Aristocrats*, including Austria, Germany, Finland and Belgium which continue their commitment to investment in learning and innovation and also at the same time they are increasing during the period of crisis; *the Decline Nobility*, including Denmark, Ireland, UK, France and the Netherlands which have a tradition of national investment in national innovation but have not increased much over the earlier period of crisis; *the Third State*, including Hungry, Latvia, Czech Republic and Italy, Spain and Portugal, which are characterized by low national innovation and also low investment of private firms (Archibugi and Filippetti 2011).

In this division of countries it is possible to see how across Europe investment in research is heterogeneous. These differences are characterised by the relatively new EU member states which although they did not have a tradition in investment and innovation they have generally increased their investment also in a period of crisis. On the other hand, countries in the last group did not have a good performance before the crisis and have not adopted investment in research during the economic crisis. The growing disparity between EU countries in terms of investment in research and innovation jeopardises the intent to create a knowledge society within the EU and it also places, within such model, in a weaker position countries which are in a way excluded from such practices. This can be also translated in compromising EU integration in terms of economic competitiveness and economic and political cohesion.

## 4   Inclusion/exclusion in the Knowledge Society

The various interpretations of the knowledge society account for the effects and influences of knowledge and information on the political, social, economic and cultural aspects of society. In these interpretations, it is stressed that the passage from industrial societies to other forms of societies has been strongly influenced by knowledge/information and technology. These transformations have been encapsulated in the term *knowledge society* which is related to social processes, actors, learning processes and elements such as values, languages or social representation involved with the production, storage, manipulation and diffusion of knowledge. Knowledge is growing in importance and it affects society and the economy, and the two have different values and understanding of the role of knowledge (Sörlin and Vessuri 2007:2). The concept of *post-industrial society* exposed by Daniel Bell (1973) emphasises the role of information and knowledge. Lundvall (1996) with the *learning economy* also argues for a crucial role of knowledge and learning, but above all a new theoretical approach to better understand the role of 'technology, skills, preference and institutions' considered outside the explanation of economic development.

There are, nevertheless, also analyses which emphasises the inclusive/exclusive character of the knowledge society. For instance, Manuel Castells calls these different interpretations related to social, technological, economic and cultural transformations the 'network society'. He also recognises the passage from industrial to information age, related to information technologies of communication and also biological technologies. According to him information has replaced energy in determining productivity but also for the elimination of space, as it can be seen in globalization, and for the 'real time feature of communication'(Castells 2000:176).

Castells argues that information is, and has been important in all societies but in the new 'network economy' information becomes important in economic productivity. Different topical information, such as international politics and climate change can inform the flow of capital and became an important factor in economic productivity. The importance of information in society is not new, but it is the 'informational shift' to the manipulation of information to increase productivity and the 'action of knowledge upon itself' which constitute a new practice (Castells 2000b:17).

Although organizations are situated in places, the logic of the network is 'placeless' and it depends on the 'space of flows' which characterises information networks' (Castells and Nyiri 2004: 23). This dimension challenges the space of places such as regions, communities and nation states. In this context power is separated from political representation, production from consumption and information from communication. It is this inclusion/exclusion that, according to Castells, displaces people and territories domination depends on the capacity of elite to articulate and disarticulate the masses. To interact with the dominant networks also means to accept the goals of those networks.

This demonstrates that knowledge has an effect on the organization of society and that knowledge should be managed and not left to grow uncontrolled (Fuller 2002:2). Although knowledge is considered to be a good it is also argued that knowledge can be influenced by interests of how knowledge interact with society, become political (Sörlin and Vessuri 2007:1) and have implication for the production, diffusion and consumption. Furthermore, issues about the role of knowledge permeate the sphere of science policy and academia, and globalization and competitiveness.

The way knowledge and information may affect and transform societies, are also reflected in the relationship between science and technology and consequently science and society. This has resulted in what Fuller calls 'management of knowledge', where private corporations are involved in the business of knowledge. If

knowledge is influencing the various spheres of society, questions may rise about the nature and provenience of such knowledge. In the Western tradition, knowledge and its pursuit is conceived for 'its own sake' (Fuller 2002:2) and knowledge thus is considered as a 'public good'. In the context of innovation and 'knowledge management' such a conception of knowledge production is not welcomed since innovation would be welcomed only in terms of profit putting to an end to research. In this way 'capturing knowledge' takes over its cultivation.

## 5   Research and Development Italy and the Economic Crisis

In Italy, at institutional level, research, through the various public programs, inter-ministerial committees and ministries, has been in the discourse of the policy making process. In fact, Italy is amongst the countries with Finland, Sweden, UK, Holland and Germany which gives high importance to research policy. The promotion of research for policies is also strongly encouraged by EU policies which have an impact on Italian research planning. Governmental bodies fund mainly unemployment and economic issues and academic research.

Research policy is given importance in the PICO (National Reform Program for Innovation Growth and Employment) with 12 strategic initiatives. In fact research policy is in the discourse of policy formulation and it is supervised by the CIPE (Inter-ministerial Committee of Economic Planning) and the MIUR (Ministry of University and Research). MIUR operates through specific funds for universities, public research agencies FRA (Fund for Applied Research) and FIRB (Basic Research Investment Fund) and fiscal automatic incentives.

The main elements of research policy are in the National Research Program and they cover the promotion and development of human capital also through the implementation of PhD programs and financial support to PhD courses in collaboration with other countries. Support for basic research is provided through the implementation of public project funding such as PRIN (Projects for relevance of National Interests), links between ordinary funds and university and scientific productivity of academic personnel, support for mission oriented programs (FIRB), support for Italian participation in the preparation of EU FPs, support for industrial research and support for research and development regional programs. The main mission of policy instruments are the development and improvement of human capital, the promotion of excellence in fundamental research, pursuit of multidisciplinarity and internationalization, collaboration between private and public agents and the use of results evaluation. In few words, the approaches and the tools set up to promote research are in line with the general approach that can be found in most advanced modern societies and at EU level.

The Monti government, in 2011, introduced innovation relevant for the research and innovation based on budget cut and the rationalization of the main research funds. The measure includes 'innovations for indirect financing and demand driven innovation in the main research areas'. Some innovations also include the 'decline of ordinary non-competitive funds', more integration in European Research and Development and simplification of the main research funds.  The establishment of the Digital Agenda in 2012 ensures the alignment with the European Digital Agenda and will deals with Research and Development projects.

However, despite these measures, Italy faces some challenges in the sphere of research and innovation. Firstly, there are insufficient reforms and performance of the higher education system and there is low share of skilled human capital. The higher education system lacks financial and human resources and the effects of the crisis on the finances of the government are impeding future development. According to Eurostat, in Italy public expenditure on research and development as percentage of GDP, GBAORD, was 0.56% in 2011, below the EU level of 0.73%. In 2012 the estimated level of GBAORD continued to decline, reaching a GDP ratio of only 0.53% (OECD).

Eurostat figures for 2011 confirm the issue of unskilled human capital. In Italy the share of persons aged 30-34 with tertiary education attainment reached only 20.3%, significantly below the EU27 average, 34.6%. Eurostat data also stress the lack of high-tech sectors in Italy: the number of employees in high-tech sectors (high-technology manufacturing and knowledge-intensive high-technology services) as percentage of total employment is only 3.3%, below then EU average (3.8%).The major barriers to the implementation of ERA objectives in Italy are represented by the low investments in research and development, and by the effects of the financial crisis.

## 6   Conclusion

The initial intent of the EU to create a space dedicated to the development of the knowledge society, in order to promote and facilitate integration, was realised with the creation of the European Research Area and thus, the importance of investing in knowledge. This goal was also intended to boost the economies of the EU to compete with the other important economies in the world. This approach has nevertheless been compromised by the economic crisis of 2008 which affected the economies of European countries and furthered impeding the idea of a European knowledge society. In fact, the crisis has changed the investment priorities of many European countries which in turns have to deal with austerity measures in order to keep under control their state

expenditures. These measures are also part of economic measures dictated by the EU commission with the intent to keep under control more unstable economies of the EU area.

Nevertheless, this situation has also compromised the already divided attempt to create a knowledge society at EU level. According to different analysis of the role of knowledge in society, there are also interpretations which warn about the exclusive character of knowledge in the network society as well as the management of knowledge driven by private interest. If the development of knowledge and the management of information relates only to particular elites and interests, it means that groups or territories which do not invest, are left out or excluded from such developments. Apart from the problem of profit, related to the production of knowledge as opposed to the understanding of knowledge as a public good, countries which do not take part in the development of a knowledge/network society will in the long run depend on the knowledge developed elsewhere. This may be the case of Italy which being one of the six funding members of the EU (at the time the EEC), its lagging behind in investment for research and innovation may well relegate it outside the network and be dependent on outside knowledge or not to be able to benefit from the knowledge available. The reason for such exclusion is mainly related to lack of investment in the knowledge society and also in scientific research. Indicative is the fact that in Italy higher education students are diminishing also because research is not adequately funded. In addition there are elevated bureaucratic impediments which also prevent foreign university and students who want to make research in Italy. The paradox is that because of the financial crisis Italy has worsened its commitment in research and development and at the same time one way to overcome its economic and political crisis is indeed greater investment in the knowledge society.

# The Role of Advertising during Recession

Asst. Prof. Dr. Ayşen Akyüz (Beykent University, Turkey)
Asst. Prof. Dr. Mustafa Ercilasun (Beykent University, Turkey)

## Abstract

Advertising plays a key role in a dynamic economy. It provides valuable information about products and services in an efficient manner; communicates customer value, builds brand awareness and creates demand. In a recession, the first things that a company usually cuts come from the advertising budget. When companies begin to cut back on advertising during an economic downturn, they become less visible to the public. While it make sense to cut off from communication budget, the evidence shows that the companies which advertise during an economic downturn, have expanded their market share and have maintained their solid image. Therefore according to marketers, neglecting marketing efforts during an economic downturn will result in weakening the brand and making it less profitable in the long run. The present study aims to provide an understanding of the marketing communications' specifically advertising's impact on companies' performance during and after recession. It lays out the theoretical foundations to evaluate the impact of advertising during the recessions and provides some evidence from the world. It is believed to be paramount to examine the existing literature and researches to create awareness in the field, about the importance and impact of advertising during economic downturns.

## 1 Introduction

This paper tries to establish a theoretical framework to understand how firms will change their advertising levels and media selections during recession times to optimize their long run profitability. It has been shown that during the economic downturns the level of advertising spending decreases along with declining economic activity (See: Figure 1). Details by world regions for advertising spending and advertising spending growth rates are provided in the appendix. In year 2009, advertising spending growth rates were negative in all world regions except for Latin America though it was the lowest growth rate compared with other years.

***Figure 1****: Global Advertising and Nominal GDP Growth **Source:** Adapted from McKinsey&Company, Wilkofsky Gruen Associates*

Observed positive relationship between economic growth and advertising growth rates is misleading. The truth is, while some firms are cutting their advertising levels, some others are increasing. They are also adjusting media usage and messaging content. Thus it is imperative to, specify conditions under which firms will behave to maximize their long-term profitability carefully. The aim of this paper is to point out the correct way to analyze the behavior of firms during recession times. In doing so, the existing literature will be reviewed and some pitfalls mentioned. Based on this critical review, the proper theoretical approach will be outlined.

## 2 Advertising

According to marketers, the focal point of the company is the customer. Thus, the primary aim of marketing is to determine the needs and wants of the customer and satisfy them. Acquiring customers, retaining them and catering to demand are paramount for the organizations. In today markets where fierce competition exists, companies have to compete not only against their local competitors, but also against to global competitors. Related to this, the consumer, in alternative evaluation phase of buying decision-making process, is being exposed to and bombarded by several communication messages. In such an environment, the organizations want to be clearly heard by the consumers. No matter how successful and useful the product is, it cannot sell itself. Therefore, the marketing communication efforts become one of the most important instruments in the competition.

The main purpose of marketing communication is to inform the potential consumers about a certain product and service, convey what the product/service promises, present the value proposition and finally send a directive message to the customers, making them perform a specific action such as purchasing. It also plays an important role in connecting with the customer, creating an emotional bond and managing the successful customer relations. As a result, it will not be possible to talk about an effective marketing system without creating effective communication channels.

Being a part of our modern lives, advertising continues its presence to be the companies' most preferred communication medium. It is maybe the one of the most important communication tool in the sense of reaching wide consumer masses, communicating the message effectively, informing the consumer, persuading to try the product, altering the perceptions of the public towards brand, creating brand personality and image. Like the other communication media, advertising influences the mental process of the consumer directly, and is basically related to the individuals' emotions. The advertising can be also thought as a reacting or effecting stimulant. The stimulating effect of the advertising is important for the producer in terms of increasing the demand.

Belch and Belch (2012:698) refers to the economic benefits of the advertising as: The advertising increases the consumption and promotes the economic growth. Advertising, not only informs the consumer about proper products and services; at the same time it facilitates the entrance of a brand/company into new markets.

Economists argue that advertising is used to achieve (1) differentiation, whereby the products or services of large advertisers are perceived as better than competitors' products and services and (2) brand loyalty. The brands that aggressively advertise, dominate the market in certain product categories, such as soft drinks. However, advertising generally doesn't create brand monopolies. In most product categories thousands of new products are introduced to the market every year. The opportunity to advertise gives companies the motive to improve the existing brands and develop new ones. Thus there is no clear evidence that advertising alone reduces competition or creates barriers to entry. Ultimately, the economic benefits of advertising show that a healthy competitive environment between the producers would be developed and the life standards would be improved through the prudent usage of the resources (Belch and Belch, 2012, p.699-701).

As it is stated, large advertisers get benefit of certain competitive advantages including economies of scale in advertising, especially to factors such as media cost. Heavily advertised brands usually sell more, which means they may have lower production costs and can invest more on advertising (Belch and Belch, 2012, p.699-701).

Advertising is very effective, informing about products and services and it plays a favourable role in the progress of the economy. As it is mentioned several times in the literature, advertising creates new demand and stimulates existing demand. It contributes to the improvement of quality and new product development and it shapes the competition and ultimately surge the production and leads to higher sales. As a result, there would be an increase in employment in order to satisfy the demand; sequentially an increase in productivity and ultimately the cycle would be completed with the customers spending more.

## 3 Recession

As discussed above the benefits of advertising to businesses already well established. However, there exist a dispute for advertising around recession times. In economics, the declining portion of a business cycle is called recession. Economists have some disagreements on how to define recession. The standard textbook definition considers two or more consecutive decline in GDP as a recession. This definition of a recession makes it difficult to identify the beginning and ending of a recessionary period. Additionally, it ignores other economic indicators such as unemployment and consumer confidence.

In the United States, the National Bureau of Economic Research (NBER) keeps track of business cycles and declares when the economy goes into a recession. According to Business Cycle Dating Committee of NBER recession is observed by looking at the change in employment, industrial production, real income and sales. They define recession as the time when business activity has reached its peak and starts to fall until the time when business activity bottoms out. The following tables show last four recessions in the United States and Turkey.

| Peak month | Trough month | Duration (in months) Peak to Trough |
|---|---|---|
| July 1981 | November 1982 | 16 |
| July 1990 | March 1991 | 8 |
| March 2001 | November 2001 | 8 |
| December 2007 | June 2009 | 18 |

*Table 1*: US Business Cycle Contractions **Source**: *http://www.nber.org/cycles/cyclesmain.html*

| Peak month | Trough month | Duration (in months) Peak to Trough |
|---|---|---|
| March 1994 | March 1995 | 12 |
| September 1998 | November 1999 | 14 |
| January 2001 | February 2002 | 13 |
| August 2008 | September 2009 | 14 |

*Table 2*: Turkish Business Cycle Contractions **Source**: *http://www.turkstat.gov.tr/,*

Many marketers who view recessions just as a decline in economic activity may follow wrong path. It is advisable to consider all aspects of a recession such as decline in income, increased unemployment, and fear to lose potential income and lost jobs etc., for consumers. For businesses it may mean uncertainty for future, less liquidity, increased cost of production. Thus, to understand advertising behavior of firms during recessions it is appropriate to go by broad definition of a recession as it is done by NBER. During recessions some businesses may cut expenditures like research & development, unnecessary travel and advertising while consumers may cut unnecessary spending; higher ticket items like durables and postpones car & home buying activity.

## 4  Advertising during Recession

During an economic downturn, it may seem logical for organizations to cut off expenses. In those times saving is much more important than spending. Expenses that a company usually cuts first, come from the advertising budget. However this decision can be argumentative. On one hand, there is a negative economic environment where because of the negative media reporting, there would be a decline in demand for the products and services and eventually companies would want to save more than they spend. But on the other hand when the companies cut back advertising expenditures, they become less visible to public.

Businesses should be aware of the opportunities that a recession can provide. Since the rivals reduce marketing efforts, there may be an opportunity for the businesses to come clear on the eyes of its target market by maintaining a strong advertising campaign during a recession. There may not be a better time to advertise than this, since many others' tendency is to reduce advertising spending. Thus, when advertising aggressively in the economic downturn, an organization might drive and maintain awareness, build a greater market share, with a more solid brand image. Advertising expenditure can be a sign of how marketers believe in their brands and it can give a sense that the advertising brand is strong and reliable than the others that do not advertise. According to the literature, the organizations that invest on advertising during a recession would increase its sales not only during the time of recession but also after the recession. The following paragraphs mentions some references regarding the issue.

Customers, during recession, search for information about a product/service instead of commercial. To gain the trust of the customers, companies should give them the right message with clear information including motives as durability, overall quality and safety (Hruzova, 2009, p: 12; Shrager, 1991).

In economic downturns, marketing can provide important functions with beneficial effects. There is a dynamic environment, constantly changing, therefore it is important for marketers to understand the changes and know how to react to them (Hruzova, 2009, p: 6; Ferrel and Hartline, 2002). Firms may view recession as an opportunity that they have control on the situation and outcome and continue to invest. On the contrary, the firms, which view recession as a threat, end up with conserving their resources (Hruzova, 2009, p: 6; Srinivasan et.al. 2008).

Some important researches were undertaken to explore the relationship between advertising and business cycle. The most important ones are summarized in the following paragraphs.

According to the analysis conducted by the American Business Press in the 1970's, advertisers who were aggressive in spending during economic contractions increased net income at a higher rate than other companies with benefits increasing during and after the recessions (Kamber, 2002, p.107; American Business Press, 1979). Another well-known series of studies was conducted by the McGraw-Hill Laboratory of Advertising

performance in the late 1970s and early 1980s. In this study there was a comparison of the business outcomes of firms that invested on advertising and those did not.

LAP reports provided additional graphic evidence about the companies that cut back advertising expenses during economic downturn suffered lower sales growth rates, especially during the 1981-82 recession, when companies reduced advertising spend, suffered growth rates of one-third that of the comparison group over the next five years (Kamber, 2002, p.107; LAP Report (undated)). A third source of data released by Strategic Planning Institute during the 1980s and 1990s. SPI, have focused on the relationship between media advertising spend and changes in return of investment covering recessions from 1974 to 1990. These studies have used a very large historical database of business statistics and besides that they have been widely cited in the business press (Kamber, 2002, p.107; SPI, 1982; Hillier, 1999). Finally, the PIMS (Profit Impact of Market Study) studies show that organizations which continued to invest on marketing efforts and even increased their investments, did not make significantly less profit during recession; furthermore, companies that increased their marketing spending gained market share three times as quickly after the downturn (Hruzova, 2009; Roberts, 2003, Hiller, 1999).

Tellis and Tellis (2009), mentions about the reasons in favor of cutting back advertising that can be easily refuted as shown in Table 3.

| |
|---|
| Claim 1: "Consumers have less disposable income during recessions" |
| Rebuttal: Since 1940, the labor force may not have declined by more than 2% 1. Similarly, consumers' disposable income has not declined by a large amount. However, advertising expenditures seem to decline more that the GDP or personal disposable income. |
| Claim 2: "Firms can cut back on advertising if competitors do too" |
| Rebuttal: Firms could also take advantage of the opportunity to seize market share from their competitors who are cutting back on advertising. |
| Claim 3: "Money can be reallocated to pay dividends." |
| Rebuttal: By cutting back on advertising, sales may decline during a recession. Alternatively, there may be a lost opportunity to build sales by advertising during a recession. These real or opportunity losses may be more in absolute value than the value to shareholders by paying out dividends. Money may be better invested in building sales and market share during a recession than in building investor faith in stocks. |
| Claim 4: "Resources could be better allocated to product development or R&D, which would later turn greater profits during market expansions." |
| Rebuttal: In a declining market, sales response may be greater to advertising than to new products. Moreover, the cost of introducing new products may make that activity more profitable during expansion than during a recession. |

***Table 3**: Claims and Rebuttals for Not Advertising in a Recession **Source:** Adapted from "Advertising During a Recession". Direct Marketing Sept 1991*

Kamber (2002, p: 108) indicates that, there seems to be the domination of evidence to support the claim that maintained or increased advertising expenditures during recession are a logical business strategy. It would give rise to a higher return on investment and improved consumer buying disposition. Kamber states that, prior research did not indicate key factors such as business size, sector that can confound the relationship between advertising and business performance. He continues that larger companies for instance, have the resources to maintain advertising spending during downturns, while the smaller competitors were cutting back the expenses. Thus, the large companies would be more likely to sustain sales growth after recessions as a result of their established presence in the market and access to credit markets. Alternately, companies with high stock multiples may feel obliged to buy more advertising during a recession to maintain investor confidence. Yet, after recessions these businesses achieve high growth rates as a result of their support in the equity markets.

As stated in the findings of Kamber's study (2002, 117), Companies that sustained or increased advertising spending during the 1991 recession had a five-year sales growth, which was %25 higher as a whole, that companies that did not. Besides he found out that there is a positive correlation between advertising spend and sales. He indicated that change in advertising spending during a recession has a positive and statistically significant relationship to short-term sales. Moreover, the relationship between advertising expenditures and sales growth is strongest during recessions and times of economic turmoil, such as the 2001 dot-com boom.

As it is mentioned above existing studies showed positive relationship with economic growth and advertising, and companies with aggressive advertising during recessions increased sales and profitability over long term. Although authors agree on these stylized facts, would like to introduce some caution on how to evaluate these findings. The following segment will outline new approach on how to handle recession and advertising.

## 5 Further Considerations

During recession times companies adjust their budgets to cut costs and manage their liquidity properly. Advertising is one the items considered. However, there are other expense categories firms may adjust such as research and development (R&D), labor cost, raw material cost. In a way, along with advertising spending these other categories may substitute or complement each other. Some firms may choose to increase R&D, while cutting back on advertising spending. Some others may increase adverting, while cutting back R&D. They may cut both or increase both. Thus it is imperative to investigate substitution and complementary effects among alternate budget items. In doing so, firm's characteristics play an important role. Therefore, studies should control for various characteristics of firms. Following characteristics are suggested: industry, existing market share, financial position, and size. Accordingly contingencies should be established as such the impact of advertising during recession analyzed under these conditions. Similarly, advertising strategies followed during recession should be identified under these contingent elements. For example, companies with dominant market share may find it difficult to acquire new customers, since their marginal cost of acquisition is already high. On the other hand, firms with lower market share with low marginal cost of acquiring new customers may find advertising advantageous. In this case large firm, rather than spending on advertising to acquire new customers may be better off by implementing retention strategy for existing customers. Therefore, they may put more emphasis on communicating with their present customers to keep them happy. Instead advertising they are better off spending on R&D and develop new products or services. Once the recession is over, they introduce new line, and then start advertising.

Another factor to consider in analyzing the impact of advertising during recession has to do with advertising and price elasticities. Depending upon the product both elasticities will be different across products and may change along with business cycles (Sirinivasan, 2011, p.49-50). As the economy goes toward recession consumers may become more sensitive toward price, due to declining incomes. This may increase price elasticity. As for the advertising elasticity may increase while the economy goes into recession. This is less competitive clutter, thus customers notice individual firms or brands easily. Additionally, during recession times media prices declines. That enables companies to buy more advertising with same dollars (Heerde et.al 2013, Deleersnyder et.al. 2009). During economic downturns consumer become price conscious and ignore image-base advertising, plus consumers would be less sympathetic toward advertising. If this were the case during recession advertising elasticity would be lower (Sethuraman, Tellis, and Briesch, 2011). As a result it not clear what happens to advertising elasticities during recession. Evidence provided by Heerde et.al suggest, in general, that during contraction advertising elasticities become larger compared with expansionary periods. Thus it is very important for managers to have good understanding about advertising and price elasticity's of their products or brands, including cross elasticity's in competitive environment in order to maximize sales.

## 6 Conclusion

In this paper authors reiterated that there is a positive correlation between advertising spending and changing business activity. However, businesses should not fall into a trap to reduce their advertising budgets during recessions, without carefully analyzing competitive landscape and their relative positions within their industry in terms of their size, market share, products etc. They have to consider all these elements in making decision to advertise more (less) or use alternate options available to them, like R&D, price adjustments, or modifying their messaging to customers. Companies who properly evaluate alternatives can prosper during recession times by converting bad economic environment to an opportunity and set themselves to grow even further during expansionary times.

# Model of Growth of the Russian Corporations: Impaction of Institutional Factors

Elena Silova (Chelyabinsk State University, Russia)

Irina Belova (Chelyabinsk State University, Russia)

Daria Bents (Chelyabinsk State University, Russia)

## Abstract

In modern conditions corporations are a core of economic system and many macroeconomic indicators depend on growth of corporations. Quality and intensity of growth of corporations depend on many factors, both internal, and external. Institutional factors, including efficiency of the contract relations, level of tax burden, quality of corporate institutes have huge impact on growth of corporations. The purpose of this work – to reveal factors of growth of the Russian corporations and to construct models of the Russian corporations' growth in a branch section. In research the assessment influence of tax loading on efficiency of the contract relations and growth of the Russian corporations is carried out. The analysis of growth of the Russian corporations in various branches (oil and gas, metallurgy, power industry) is carried out and models of their growth taking into account such factors, as tax burden, level of dividend payments and level of compensation of the administrative personnel are constructed. The degree of tax burden to efficiency improvement of contractual relations in Russian corporations was analyzed. The growth rate of sales revenue was taken as an indicator of the corporation efficiency. The factors influencing the growth rate of sales revenue were analyzed, the basis for the analysis was Cobb-Douglas production function with some clarifications.

## 1 Introduction

In modern conditions, corporations are a kernel of an economic system, and many macroeconomic indicators a standard of living and welfare of the population depend on the growth of corporations. In our opinion, today there is no integrated approach to the research of factors of the economic growth of corporations, in particular the question of the institutional factors influence of growth on economic growth remains insufficiently studied. In this work the efficiency of contact relations as an institutional factor of growth is investigated. In its turn this category is considered through a prism of the quality of corporate institutes, a level of opportunism and the qualification of managers. As an external institutional factor of the growth of corporations a level of a tax burden is considered. The paper's purpose is to construct models of factors of growth for Russian corporations.

Many factors influence the quality and intensity of the growth of corporations, both internal and external. Demand factors, factors of offer and factors defining the distribution of resources are considered as classical factors of economic growth.

We will understand a quantitative increase in the main indicators of activity as the economic growth of corporations (first of all outputs. although the number of personnel. fixed assets. etc. can be considered as indicators of growth), which is a basis for an increase of the efficiency of activity of corporation. Under "factors of economic growth" in this work we understand variables of the external and internal environment of a firm, which have a direct or indirect impact on economic growth. Scientists of different methodological directions tried to reveal the major factors of economic growth.

For the first time, factors of economic growth were considered by Jean-Baptiste say. He considered that three factors take part in the creation of a value of a product: work, land and capital. Say's law is an exclusively simple idea that the process of the production of goods creates an income which is exactly equal to the cost of goods made. It means that the production of any volume of products automatically ensures an income necessary for a purchase of all products in the market. An offer generates its own demand.

A. Marshall allocated such factors as: customs, the strength of family relations, public safety along with capital, that is to say, for the first time it is possible to speak about certain institutional factors of economic growth (Marshall, 1993).

J. M. Keynes puts forward the following "recipes" in "The General Theory" for the purpose ensuring an effective demand as a defining factor of growth and an increase of an employment rate (Keynes, 2012):

1. A monetary policy, the regulation of an interest rate. It was offered to lower a percent rate for credits, which will increase a gap between the cost of credits and the expected profitability capital investment and lift their "marginal efficiency". Businessmen will put money not in securities, but in production development.

2. A budgetary policy. In order to stimulate an effective demand, J. M. Keynes offered to increase public expenditures, state investments and government procurements of goods. It was also recommended to reduce taxes. But nevertheless J. M. Keynes considered the building-up of expenses as the main thing.

Further on, an increase in the expenditure part of the state budget will be compensated by new tax revenues formed at the expense of an increase in the production and in the expansion of employment.

3. The redistribution of incomes in the interests of social groups gaining the lowest income. Such a policy was called on to increase "the demand" of these social groups, increase the monetary demand of mass buyers. A tendency for consumption in society is to increase.

4. A full-employment policy directed at prevention from a considerable unemployment, at an expansion of the system of social security.

E. Domar considered that investments are a factor of not only an income's creation, but also of new capacities. A dynamic balance of supply and demand according to E. Domar is defined by the dynamics of capital investments which form new capacities and a new income. Therefore, the task is reduced to determining the volume and the dynamics of investments.

R. Harrod developed the model E. Domar (Harrod, 2008). For various norms of growth, R. Harrod puts forward the following statement: the system of free business will effectively function if incomes grow at accelerated rates. Investments have to anticipate the dynamics of a consumer's demand.

R. Solow, E. Denison, J. Mid considered other agents as factors of economic growth. In particular, in Solow's model, a norm of savings is a key factor defining a level of stability of a capital-to-labour ratio (Solow, 1956). A higher norm of savings provides a bigger stock of capital and a higher level of production. Another factor of continuous economic growth in conditions of steady economy is population growth. A third source of economic growth, after investments and population increase is technical progress. In the neoclassical theory, technical progress means high-quality changes in production (an increase of the education of workers.an improvement of the organization of work, a growth of scales of production).

Schumpeter and Smith have different views. In Schumpeter's theory, population growth is exogenous, and a coefficient of savings is relatively constant and is not a locomotive of growth. Schumpeter did not attach a great value to distribution. From his point of view, alternating changes in the economic sphere were a locomotive of "development" (as a counterbalance to habitual growth). They were caused by different reasons (for example, a sudden opening-up of new sources of offer), but the main thing was an entrepreneurial innovation which provided for development (Schumpeter Y.. 1982).

T. Eggertsson, E. de Soto singled out cultural factors, legislation, fight for wealth distribution, a level of transactional expenses as agents of economic growth (Eggertsson, 2001; Soto, 2008).

In modern economic science, one distinguishes between straight and indirect factors by their way of impacting economic growth. Factors which make growth physically possible are considered as straight ones. This group includes factors of offer: the quantity and quality of natural resources, the quantity and quality of manpower, a volume of fixed capital, a level of the development of entrepreneurial abilities in society, technology and production organization. Indirect factors are conditions permitting to realize opportunities of economic growth, available with society.

## 2   Methodology and Data

It is possible to divide factors influencing the economic growth of large corporations, depending on a source of influence, into two groups: internal and external. Internal factors include: a position of a corporation in the market, available resources. their accessibility, quality, cost, a level of technological equipment, personnel potential, innovative activity and the motivation of personnel, the financial policy of a company, the level and quality of management, etc. In its turn, internal factors of growth can be divided into 3 groups: administrative, production and market. The classification of factors of the growth of corporations is presented in Table 1. Factors are classified by two main criteria: according to the extent of their influence on economic growth and depending on an impact source (Silova, 2007).

External factors of the economic growth of corporations are the reasons influencing them from outside directly (the appearance of alternative sources of resources and energy, market monopolization, the construction of new capacities. a loss of reputation of a company) and indirectly (a change of legislation in a country and the world.an increase in universal prices of resources. economic stability. a fall of an inflation rate, a change of the ratio between courses internal and foreign currencies). Indirect external factors of economic growth are distinguished as: market factors (a change of the world's prices of resources. a level of monopolization), financial and economic (a rate of inflation. an interest rate), normative legal factors, as well as factors connected with external economic regulation (export. other aspects of tariff and customs regulation), force majeure circumstances (natural disasters. military operations. a criminal situation).

Within the framework of a developed economic science, in our opinion, institutional factors of economic growth of corporations remain insufficiently investigated, which in this regard have a huge impact on the growth of corporations. Among them it is necessary to consider such institutional factors of economic growth, as efficiency of contract relations, a level of a tax burden, the quality of corporate institutes. In this work, an

attempt is presented, aimed at revealing the influence of these factors on economic growth by the example of Russian corporations. We will consider at first in more detail the essence of these institutional factors and the mechanism of their influence on economic growth. Institutional factors reflect a level and the quality of development of the institutional environment of one or another state, one or another corporation. Institutional factors influence economic growth indirectly, defining a performance level of major production factors, setting a certain vector of social and economic development as a whole. For example, A. Marshall ascribes such a factor as "public safety" to agents of the growth of a country's gross revenue along with the number and productivity of workers, capital (saved-up wealth), natural resources and an equipment level. This factor can be treated as a generalized characteristic of a status of external and internal conditions of activity of economic entities.

| Factors of Economic Growth | Kind of Factor | Indices of Economic Growth |
|---|---|---|
| Internal | Direct | - Number of concerned employees |
| Factors of Offer | Quantity and quality of basic factors of production | - Skill level of personnel<br>- Labor productivity<br>- Quantity and structure of fixed assets of an enterprise<br>- Investments in research and development |
| | Volume of productive capital | Quantity and quality of capital<br>- Fixed property rights of an enterprise to certain types of resources<br>- Volume of investments |
| Factors of Demand | Indirect | - Price of a corporation's products |
| | Price factors | |
| | Non-price factors | - Number of consumers of products<br>- Expectations of consumers<br>- Quality of production<br>- Demand stimulation |
| Factors of Distribution | Involvement of resources | - Volume of available stocks of resources<br>- Rights for the investigation and development of new fields<br>- Level of the loading of a technological chain |
| | Rational distribution of resources | - Level of used technologies<br>- Production and processing monopolisation<br>- Improvement of mechanisms of committing transactions in the market |
| Institutional Factors | Efficiency of internal functioning | - Efficiency of contractual relations<br>- Level and quality of management<br>- Motivation of personnel<br>- Culture of production<br>- Level of energy efficiency of resources<br>- Level of energy saving of resources |
| External Factors | Indirect | - Level of a tax burden |
| Institutional | Efficiency of institutional development | - Legislation and state policy<br>- Level of the development of the education system and science<br>- System of values of society<br>- Culture level in society |
| Factors of Demand | Non-price factors of demand | - Price of associated goods and technologies<br>- Level of taxes and duties |

**Table 1.** *Classification of Factors and Indicators of Economic Growth of Corporations* **Source:** *authors*

In Harrod-Domar's Keynesian model of economic growth, rates of it are defined by two variables: a share of investments (in this respect, a condition of equality of investments to savings is seldom satisfied in real life) and an efficiency of accumulation. In this regard, already on the basis of this model it is also possible to single out and major institutional factors of economic growth, having divided them into two main groups: one of them includes factors influencing a norm of the accumulation or a level of investments in a country (a tax system. a level of trust of citizens in the economic policy of the state. a rate of inflation. a monetary policy. etc.). We will attribute factors influencing efficiency of investments to the second group (a level of transactional expenses, the distribution and protection of property rights). We will also note that canonical scientists noted in their time that

not only production factors themselves, but also their productivity which is assured by qualitative institutes, act as factors of economic growth.

By institutional factors we understand in this work the most general characteristics (conditions) of the institutional environment or separate institutes having the greatest impact on rates of economic growth in an indirect way by influencing the productivity of material factors of economic growth. Institutional factors define operating conditions of economic entities and determine the efficiency of their activity (Barkhatov de Pletnev, 2013).

One of the central institutional factors of growth, in our opinion, is the efficiency of contract relations in a corporation. It is known that corporations arose from the global process of the separation of property from management at the beginning of the twentieth century. The problem of similar separation and its consequence are considered in the institutional theory within the doctrine of "an agent-principal". Modern corporations are characterized by a plurality of entities of management and. respectively, by the existence of often diverging and even opposite interests, which can cause numerous conflicts. The main problem is already wider than the commonly accepted issues of relationships between managers and shareholders. And other groups of participants of corporate relations, including workers and the state, are more and more actively involved in processes of the distribution of resources and decision-making.

By the efficiency of contractual relations in a corporation we will understand an ability of the relations to satisfy economic interests of entities of contractual relations in a corporation on the basis of the redistribution of property rights. In its turn, by contractual relations in a corporation we will understand economic relations of an owner-manager, a manager-hired employee regarding the transfer of property rights on the basis of a developed system of institutes, for the purpose of harmonizing economic interests of entities.

Benz. (Bents, 2010) considers a defining level of the efficiency of contract relations as a major factor – a share of transferred property rights. The higher is a share of transferred ownership rights, the higher is a level of the efficiency of contract relations. In other words, the dependence between the considered values is positive.

The mechanism of the influence of managers' opportunism on the efficiency of contractual relations is quite clear: with an increase in managers' inclination to opportunism efficiency decreases. The opportunism of managers begins to manifest itself owing to differently directed interests, i.e. when their personal interests and those of owners cease to coincide. Shareholders are first of all interested in getting an income from the capital invested in a corporation, whereas managers are focused on personal enrichment. The existence of opportunism reduces a share of rights which it is expedient to transfer to a manager. A management's skill level, on the contrary, positively affects the efficiency of contractual relations. The lower is the skill level of a manager, the lower is a level of efficiency, which is provided by a unit of ownership transferred to a manager. A decrease of a skill level of a manager with a growth of opportunism similarly affects the level of the efficiency of contractual relations, reducing it.

According to E.S. Silova (Silova, 2007), corporate institutes have an important impact on the efficiency of contractual relations and are an important institutional factor, forming that institutional environment in which participants of corporate relations act. A corporate institute represents norms, rules, mechanisms and procedures which provide a balance of interests of all participants of corporate relations and a transparency of the management of a corporation. The most important functions of corporate institutes are decreasing an uncertainty and increasing stability of all corporate interactions, and lowering transactional expenses. Corporate institutes provide the creation and functioning of "the rules of the game" of all participants of corporate institutes. It depends on their quality, to what extent rights and interests all of operating entities are protected in a corporation, to what extent their interests are balanced, and to what extent major corporate procedures and legislation requirements are observed.

Among significant external institutional factors of economic growth, it is necessary to consider, in our opinion, a tax burden. A tax burden is one of concepts applied to an assessment of the influence of tax payments on the financial condition of a corporation, in particular, on an operating profit. According to I. A. Belova (Belova, 2011),tax payments play a significant role in the management of an operating profit of a corporation, stipulate the size of this profit, ways of achieving and increasing the welfare of owners of a corporation in the current and expected period. In this case, one of determinative goals of a corporation is the formation of an effective tax policy of an enterprise, permitting, on the one hand, to optimize inflows of tax payments and, on the other hand, to increase the overall effectiveness of operating activities of a corporation. An important role is played in this regard by an assessment of tax obligations, which permits to define the extent to which the existing tax system is burdensome for an economic entity and what share of resources is attracted by budget payments to themselves that is to determine a tax burden of a corporation.

The size of a tax burden depends on a multitude of factors, beginning from a kind of activity and a form of its implementation, a tax regime, an organizational and legal form of a corporation and features of tax and business accounting, fixed in an accounting policy. The calculation of a tax burden, as factor of economic growth, permits

a corporation not only to carry out an analysis of its state for a number of years, but also to make a forecast of possible options of the changing of a tax burden, achieving its optimum value.

At the moment, Russian corporations have offered the following indicator with respect to an assessment of a tax burden, which enables one to obtain the most generalized characteristic of the efficiency of a chosen tax policy, namely a share of taxes in revenue. This indicator is defined as ratio of all taxes paid by an organization to revenue, including an income from other realizations. In this regard, this indicator may be used by corporations applying any system of taxation. However, it will strongly differ for corporations of various branches of economy. The highest level of a tax burden in the branches of national economy investigated by us falls on corporations of the oil and gas branch. A slightly lower level of a tax burden falls on corporations of the metallurgical branch. Corporations of the electrical power branch have the lowest level of a tax burden.

This research operates the financial reports made by 28 Russian corporations (of Oil and Gas, Metallurgical, Electric Power Branches). As a basis of research next indicators were used: revenue, sum of basic assets, expenditures on personnel, dividends to shareholders, sum of awards paid to key management personnel, tax burden. Growth Rate of indicators mentioned were used as parameters of the production functions. IAS financial reports from the official websites were taken as the information source.

We will accept a growth rate of revenue from sales as an indicator of the economic growth of a corporation. We will analyze factors influencing a growth rate of revenue from sales. Basing ourselves on othe neoclassical economic theory, a characteristic of which is the quantitative mathematical simulation of economic processes and phenomena, we will assume a production function as a basis of an analysis. By a production function a technological dependence between the quantity of the resources spent by a firm in a unit of time and the greatest possible volume of produced goods are understood.

A general view of the production function is as follows:

$$Q = f(X_1, X_2, ..., X_n) \quad . (4)$$

where Q is a release volume in a unit of time.

X1. X2. Xn is a quantity of used resources in a unit of time.

Among two-factorial production functions, that of Kobb-Douglas is the most known:

$$Q = A \cdot X^\alpha \cdot Y^\beta \quad , (5)$$

Where A, α, β are positive constants;

X, Y is a quantity of employed resources (as a rule, labour and capital).

Let us take the function of Kobb-Douglas with some elaborations:

1) since indicators of the volume of production, labour and capital, have a cost assessment and are reflected in financial statements of corporations, then we will take an income from sales as a volume of production; expenses of a corporation on personnel as labour; and a cost of basic assets (understanding real capital by the notion of capital) as capital;

2) we will take a rate of the growth of a revenue from sales as a resultant indicator, and a growth rate of expenses on personnel and a growth rate of the residual cost of basic assets as factorial variables;

3) we will enter a production function as a third factor: in the first case a growth rate of incomes paid to shareholders following the results of a year; in the second case a growth rate of remunerations paid to key administrative personnel; in the third case a growth rate of a tax burden.

With the prerequisites stated above, a production function in the first case will be as follows:

$$i_Q = A \cdot i_K^\alpha \cdot i_L^\beta \cdot i_D^\gamma \cdot i_P^\lambda \cdot i_T^\varphi \quad , (6)$$

Where $i_Q$ is an index of a change of a corporation's revenue (a ratio of the value of a revenue from the realisation of products in 2013 to the revenue of 2012);

$i_K -$ is an index of a change of a corporation's capital (a ratio of the sum of basic assets in 2013 to the sum of basic assets in 2012);

$i_L -$ is an index of a change of labour (a ratio of expenditures on personnel in 2013 to the corresponding sum in 2012);

$i_D -$ is an index of a change of the value of incomes paid to shareholders (a ratio of the value of incomes of 2012 to the sum of incomes in 2011);

$i_P -$ is an index of a change of a sum of rewards paid to key management personnel of a corporation (a ratio of the value of the reward in 2013 to the sum of an award in 2012);

$i_T -$ is an index of a change of the value of the tax burden of a corporation in 2013 to the value of the tax burden in 2012);

$A, \alpha, \beta, \gamma -$ are parameters of a function.

Therefore, along with classical factors of corporation growth – such as labor and capital – the contractual relationship efficiency, dividend policy and tax burden level were considered as institutional factors of corporation growth.

## 3  Results

We chose a number of large corporations with obviously various growth rates of incomes from sales as an object of our analysis. We will assume a list of top 400 corporations, published by the Rating Agency "Expert", as a basis, namely 9-10 corporations at a time from three key branches of Russian economy (Table 2).

Using selected financial data over the period 2012 – 2013 we calculated growth rate of the following indicators: revenue, sum of basic assets, expenditures on personnel, dividends to shareholders, sum of rewards paid to key management personnel, tax burden. Therefore, according to received results we have come to the following conclusions:

- the most stable growth of basic assets are given by Oil and Gas Branch;
- as for the indicator "expenditures on personnel" we can see different tendencies in researched Branches: for example, Rosneft and Novatek show considerable increase of the indicator; other Corporations show decrease of the indicator; the highest growth rate are presented by Oil and Gas Branch; inessential growth rate are given by Metallurgical and Electric Power Branches;
- the indicator "dividends" has the greatest volatility; for example, MMP and AVISMA show multiple increase of the indicator; other Companies show decrease of the indicator (for example, Lenenergo and NLMP);
- the indicator "rewards paid to key management personnel" increase at a low pace; Holding MRSK and Norilskynickel are exclusions – these Companies show decrease the indicator;
- the indicator "tax burden" has no clear tendency.

For the next step we use the following results (Table 2) for building the production functions.

Then we took correlation analysis between the indicators mentioned above. According to received results we have come to the following conclusions:

- the strongest connection is seen between Growth Rate of Revenue and Growth Rate of Expenditures on Personnel;
- less strong connection is seen between Growth Rate of Revenue and Growth Rate of Capital, as well as between Growth Rate of Revenue and Growth Rate of Rewards to key management Personnel;
- connection between Growth Rate of Revenue and other indicators almost is insufficient (line correlation coefficient between Growth Rate of Revenue and Growth Rate of Dividends is only 0,065; line correlation coefficient between Growth Rate of Revenue and Growth Rate of Tax Burden is at the lowest level 0,012).

| Serial Number | Corporation | Growth Rate of Revenue | Growth Rate of Capital | Growth Rate of Expenditures on Personnel | Growth Rate of Dividends | Growth Rate of Rewards | Growth Rate of Tax Burden |
|---|---|---|---|---|---|---|---|
| Corporations of Oil and Gas Branch | | | | | | | |
| 1 | JSC "Lukoil" | 1.02 | 1.17 | 1.00 | 0.83 | 1.13 | 0.98 |
| 2 | JSC "Gasprom" | 0.97 | 1.02 | 0.95 | 0.86 | 1.08 | 0.93 |
| 3 | JSC "Tatneft" | 0.96 | 0.98 | 1.01 | 1.13 | 1.00 | 1.03 |
| 4 | JSCNK "Rosneft" | 1.41 | 1.88 | 1.31 | 1.11 | 1.00 | 0.98 |
| 5 | JSC NGK "Slavneft" | 0.90 | 1.00 | 0.96 | 0.73 | 0.92 | 0.99 |
| 6 | JSC "Novatek" | 1.31 | 1.15 | 0.94 | 1.04 | 1.13 | 1.03 |
| 7 | JSC "Surgutneftegas" | 0.84 | 1.64 | 1.02 | 1.14 | 0.95 | 1.16 |
| 8 | JSC NK "Russneft" | 0.84 | 1.32 | 1.02 | 1.02 | 1.02 | 0.91 |
| 9 | Alliance Oil Company | 1.09 | 1.01 | 1.03 | 1.00 | 1.29 | 0.91 |
| Corporations of Metallurgical Branch | | | | | | | |
| 10 | JSC "EvrazGroup" | 0.90 | 0.94 | 1.07 | 0.76 | 1.52 | 0.68 |
| 11 | JSC "Severstal" | 0.89 | 1.13 | 1.10 | 0.78 | 1.08 | 0.77 |
| 12 | JSC "RUSAL" | 0.89 | 0.95 | 1.06 | 1.00 | 1.21 | 0.32 |
| 13 | JSC "Magnitogorsky Steel-Making Integrated Plant" (MMP) | 1.00 | 1.00 | 1.09 | 20.60 | 0.95 | 1.04 |
| 14 | JSC "Novolipetsky Steel-Making Integrated Plant" (NLMP) | 1.04 | 1.11 | 0.49 | 0.23 | 0.98 | 0.73 |
| 15 | JSC "Mechel" | 0.90 | 1.11 | 1.29 | 0.89 | 5.20 | 1.26 |
| 16 | JSC "Norilskynickel" | 1.02 | 1.03 | 1.05 | 0.79 | 0.09 | 0.89 |
| 17 | JSC "ChTPZ" | 0.85 | 0.55 | 1.08 | 1.00 | 1.00 | 1.45 |
| 18 | JSC "Corporation VSMPO-AVISMA" | 1.20 | 1.16 | 1.12 | 5.13 | 1.00 | 1.22 |
| 19 | JSC "Chelyabinsk Zinc Plant" | 1.03 | 0.29 | 1.00 | 1.00 | 1.00 | 0.69 |
| Corporations of Electric Power Branch | | | | | | | |
| 20 | Holding MRSK | 0.98 | 1.11 | 0.97 | 0.88 | 0.04 | 0.77 |
| 21 | JSC "EnelOGK-5" | 1.10 | 1.08 | 1.15 | 1.00 | 1.61 | 1.73 |
| 22 | JSCFSKEES | 1.01 | 1.12 | 1.09 | 0.01 | 0.64 | 0.16 |
| 23 | JSC "Inter RAO EES" | 1.04 | 1.24 | 1.20 | 1.02 | 1.69 | 0.61 |
| 24 | JSC "Far East Power-Generating Company" | 1.05 | 1.11 | 1.00 | 1.00 | 1.02 | 1.00 |
| 25 | JSC "Lenenergo" | 1.03 | 1.05 | 1.01 | 0.37 | 0.84 | 0.98 |
| 26 | JSC "Kvadra-Power-Generating Company компания» | 0.99 | 1.28 | 1.10 | 0.63 | 1.80 | 1.00 |
| 27 | JSC " Rusgidro" | 0.81 | 1.06 | 0.98 | 0.99 | 0.96 | 0.55 |
| 28 | JSC Concern "Rosenrgoatom" | 0.99 | 1.14 | 1.08 | 1.00 | 1.13 | 2.12 |

**Table 2.** *Result of Calculation of Factors of the Production Function* **Source:** *the above is calculated by the authors on the basis of data of corporations' financial statements*

The interconnection between indicators researched in Oil and Gas Branch is demonstrated on Figures 1, 2, 3.
*Figure 1. The correlation between Growth Rate of Revenue and Growth Rate of Capital in Oil and Gas Branch*

The line correlation coefficient (r) between Growth Rate of Revenue and Growth Rate of Capital is only 0,118. That's why we can state insufficient connection of these indicators.

*Figure 2. The correlation between Growth Rate of Revenue and Growth Rate of Expenditures on Personnel in Oil and Gas Branch*

The line correlation coefficient (r) between Growth Rate of Revenue and Growth Rate of Expenditures on Personnel is 0,317. Therefore we can state stronger connection of these indicators.

*Figure 3. The correlation between Growth Rate of Revenue and Growth Rate of Rewards to key management Personnel in Oil and Gas Branch*

The line correlation coefficient (r) between Growth Rate of Revenue and Growth Rate of Rewards to key management Personnel is 0,107. This connection is insufficient.

The correlation between indicators researched in Metallurgical and Electric Power Branches is the same or even less sufficient.

A calculation of parameters of production functions for Russian corporations specified in Table 2 led to the following results:

| Serial Number | Branch | Production function | Determination ratio ($R^2$) |
|---|---|---|---|
| 1 | Oil and Gas Branch of Russia | $i_Q = 0{,}97 \cdot i_K^{0,16} \cdot i_L^{1,53} \cdot i_D^{-0,18} \cdot i_P^{-0,13} \cdot i_T^{0,088}$ | 0.52 |
| 2 | Metallurgical Branch of Russia | $i_Q = 0{,}96 \cdot i_K^{0,0005} \cdot i_L^{0,206} \cdot i_D^{0,046} \cdot i_P^{-0,03} \cdot i_T^{0,038}$ | 0.51 |
| 3 | Electric Power Branch of Russia | $i_Q = 0{,}94 \cdot i_K^{0,06} \cdot i_L^{0,77} \cdot i_D^{-0,036} \cdot i_P^{-0,003} \cdot i_T^{0,09}$ | 0.54 |

***Table 3.*** *Results of the Construction of Production Functions* ***Source:*** *it is calculated by authors on the basis of the corporations given to financial statements*

The coefficient of multiple determination of $R^2$ of the constructed regression made 0.51-0.54 that speaks about acceptable level of adequacy of the constructed model. To top management and an index of dividends in all three functions I made degree of an index of the amount of remunerations either insignificant size, or negative that speaks about inverse relationship between the size of proceeds from sales of production and the amount of the paid remunerations. Thus, construction of production functions allows to draw a conclusion that payments and to shareholders, and managers do not depend on what speed the corporation develops and grows.

In addition to the received results, we will carry out a correlation analysis the results of which are reflected in Table 4.

| Factors | Revenue Index of Corporations of a Metallurgical Complex | Revenue Index of Corporations of an Oil and Gas Complex | Revenue Index of Corporations of a Power Complex |
|---|---|---|---|
| Index of Capital | 0.18 | 0.34 | 0.16 |
| Index of Expenditures on Personnel | 0.25 | 0.58 | 0.52 |
| Index of Dividends | 0.26 | 0.25 | -0.09 |
| Index of Rewards to key management Personnel | -0.32 | 0.34 | 0.27 |
| Index of a Tax Burden | 0.12 | -0.14 | 0.33 |

***Table 4.*** *Results of the correlation analysis*

The results of the correlation analysis permit to draw the following conclusions: the most essential factor of the growth of corporations is man. It is work and labour productivity that can be referred to a key factor, which fact is confirmed by the classical economic theory. Institutional factors have very weak influence on economic growth of corporations as well as contractual relationship efficiency. Moreover, the connection between Growth Rate of Revenue and Growth Rate of Rewards to key management Personnel in Metallurgical Complex is negative. That's why influence of managers' qualification on Corporation Growth Rate is quite doubtful. Tax burden also doesn't have effect on corporation growth (all researched sectors show low correlation coefficient).

We considered dividend policy as a significant institutional factor. The theory says dividends are good indicator for the investment market. High dividends make corporation more attractive for investors, favoring corporation value growth and the improvement of company's goodwill. However, according to numbers this factor is also insufficient for Russian corporations.

## 4 Conclusions

As a result of the obtained calculations, we can draw the following conclusions: capital and labour being classical factors of the growth of corporations do not equally manifest themselves in various branches of Russian economy. The strongest impact is made by the growth of capital in an oil and gas complex. Such an influence of capital in a power branch can be explained by a fact that it is the oil and gas complex of Russia that is the most capital-intensive: the constant need of the world in fuel resources demands for essential investments into the modernization of basic capital.

The growth of incomes makes an extremely insignificant impact on a corporation's growth. The same concerns remunerations as well. Remunerations of managers of large Russian corporations are so great that any further growth of will practically not have any positive impact on the growth of corporations. As a result, remunerations can be in no way attributed to factors of the growth of Russian corporations.

Regarding a tax burden, it is possible to state the following: tax legislation of Russia is extremely loyal with respect to large corporations which were exactly an object of our research. And therefore, small rates of the growth or decrease of a tax burden will not have any impact on a corporation's growth. In our opinion, such a factor as a tax burden will make an impact only in case of big fluctuations.

Thus, each of the considered factors separately makes an insignificant impact on a corporation's growth. In our opinion, it is a level of efficiency of contractual relations that is a key factor of the growth and development of Russian corporations. Today, contractual relations in the majority of corporations are not regulated and therefore not all Russian corporations show an essential growth.

# Forecasting of Economic Efficiency of the City-Forming Enterprise in the Monotown

Ph.D. Candidate Oksana Gurieva (Chelyabinsk State University, Russia)

Prof. Dr. Viktor Barhatov (Chelyabinsk State University, Russia)

## Abstract

Research objective is development of the forecast of scenario conditions of increase of economic efficiency of the city-forming enterprise of the monotown for further social and economic development of the region for 2014-2016. For achievement of a goal a number of tasks is solved: consideration of theoretical prerequisites to concept economic efficiency; research of features of economic efficiency of the city-forming enterprise in the monotown; choice of a method of forecasting; forecasting of economic efficiency of the city-forming enterprise. When carrying out research scenario approaches and expert methods of forecasting are used. The main versions of the forecast – option 1 (conservative), option 2 (moderate and optimistical) and option 3 (forced) – are developed on the basis of a uniform hypothesis of external conditions and differ with models of behavior of the enterprises of the monotown, and as with prospects of increase of their efficiency. It is established that at realization of all versions of the forecast economic efficiency of the city-forming enterprise of the monotown increases. However quality of this increase in considered scenarios of the forecast of social and economic development of the region variously. As the most acceptable the moderate and optimistical option is recognized, so at its realization economic efficiency will increase on the average 0,7 items above, than in option 1. The moderate and optimistical option is more focused on innovations, assumes carrying out transformations in development of the human capital and science, and also active modernization of the enterprise.

## 1 Introduction

For achievement of a goal a number of tasks is solved: consideration of theoretical prerequisites to concept economic efficiency; research of features of economic efficiency of the city-forming enterprise in the monotown; choice of a method of forecasting; forecasting of economic efficiency of the city-forming enterprise. When carrying out research scenario approaches and expert methods of forecasting are used. The main versions of the forecast – option 1 (conservative), option 2 (moderate and optimistical) and option 3 (forced) – are developed on the basis of a uniform hypothesis of external conditions and differ with models of behavior of the enterprises of the monotown, and as with prospects of increase of their efficiency. It is established that at realization of all versions of the forecast economic efficiency of the city-forming enterprise of the monotown increases. However quality of this increase in considered scenarios of the forecast of social and economic development of the region variously. As the most acceptable the moderate and optimistical option is recognized, so at its realization economic efficiency will increase on the average 0,7 items above, than in option 1. The moderate and optimistical option is more focused on innovations, assumes carrying out transformations in development of the human capital and science, and also active modernization of the enterprise.

## 2 Consideration of Theoretical Prerequisites to Concept Economic Efficiency of the City-Forming Enterprise

We will consider approaches on problems of economic efficiency of the city-forming enterprises stated in works of the Russian and foreign scientists in the field of economy. The majority of scientists differently treat this category, attaching crucial significance to these or those forms of efficiency. At the initial stage of development of political economy there were approaches to connect efficiency not with the concrete enterprise, and with this or that branch of national economy. So representatives of mercantilists considered efficiency of foreign trade since efficiency of development of the state contacted its balance of trade balance. The states sought to develop during this era export-import transactions bringing in the additional income. Representatives physiocrates connected economic efficiency with agriculture, only agriculture, according to doctrines physiocrates is that branch where the pure product, a source of public wealth is created. Representatives of classical school of the theory of cost and distribution of economic efficiency connected with the industry and considered production efficiency on the basis of made work. Representatives of historical school connected efficiency of national productive forces with category of a land rent. Representatives of classical institutionalism connected efficiency with institutes – forms and borders of activity of people in the course of corporate activity. In works of economists of a neoclassical naprvleniye problems of efficiency of corporations were considered connected with distribution of resources for economic activity in economy. The Russian economic theory considered economic efficiency from the point of view of profitability of production. During research of macroeconomic and microeconomic efficiency of the city-forming enterprise we investigated its main feature. It includes resource, economic, institutional and social efficiency. Resource efficiency is understood as degree of intensity of use of resources of the city-forming enterprise which change doesn't rely on the price of made

production or used factors of production. Economic efficiency considers the solvent demand shown by this or that market according to usefulness of result of activity (product) of the city-forming enterprise, and the market prices connected with it. Institutional efficiency is characteristic for conditions of transformational economy in which the great value is got by the institutional aspects of activity reflecting the purposes of institutional agencies, connected with the enterprise of public sector. Institutional efficiency expands the horizon of an assessment of integrated efficiency to borders of the period of completion of the main institutional transformations in a branch, market and regional environment of the city-forming enterprise. Social efficiency appeared as result of activity of the city-forming enterprise in the field of the solution of social problems in society. It is expressed in such indicators, as level and quality of life of the population, including – an education level, health care, social security, development of science and culture, alignment of levels of the income of different segments of the population and others. The category "economic efficiency" is considered as result of a ratio of gained income and the incurred expenses, as ability of system to reach the objectives determined by functions of the system. At a microeconomic level economic efficiency is shown at the enterprises as profitability of activity. For the city-forming enterprise such approach is narrow. As, besides economic, it carries out also social and other functions. (Barkhatov V. I. ve Barkhatov I.V, 2002).

## 3  Forecasting of Economic Efficiency of the City-Forming Enterprise in the Monotown

As economic efficiency is a ratio of useful result and expenses for further forecasting of efficiency of the enterprise it is necessary to reveal interrelations of volume of output, expenses and arrived that it is possible to make by means of economic-mathematical modeling. Economic-mathematical modeling allows to define quantitative expression of interrelations between indicators the volume of output, expenses and profit and the factors influencing their size. Creation of economic-mathematical model of interrelation of volume of output, expenses and profit consists of several stages: Economic problem definition and the purpose of its decision - studying of dynamics of indicators in a definite time (year) and identification of the factors influencing this dynamics. Calculation of functional dependence of volume of output, expenses and profit on defining factors - a statistical assessment of initial information regarding its compliance to requirements of the carried-out analysis; Development of various versions of the forecast of indicators. (Barkhatov V. I. ve Pletnyov D. A., 2003)

The analysis and assessment of possible dynamics of indicators in the future - stay and a statistical assessment of the equation of communication between productive and factorial signs. Choice of optimum option, i.e. adoption of the administrative decision.

When developing model of volume of output, expenses and profit initial information has to conform to the following requirements:

The variation of productive and factorial signs has to be observed visually;

The statistical group has to be uniform in the qualitative and quantitative relation;

The number of objects of supervision has to be more number of factorial signs;

Factorial signs have to be closely connected with a productive sign, but shouldn't be closely connected among themselves. The purpose of development of model of volume of output, expenses and profit consists in identification of interrelation and disclosure of nature of communication and extent of influence of factorial signs on the productive. The model joins only the major (defining) factors. Check of validity of model carry out in practice. Thus imposing appearance of model, i.e. duration of nablyukdeniye for the studied period matters. The process of forecasting leaning on statistical methods, breaks up to two stages. The first stage – inductive. At this stage synthesis of data for more or less long period of time and representation of the corresponding statistical regularities in the form of model is carried out: equation of dependence on one or several arguments. The second stage – deductive. At this stage the forecast is carried out and on the basis of the found general regularity private expected value of a predicted sign is defined. The economic-mathematical model can be based on the functional or correlation analysis are effective methods which allow to analyze considerable volumes of information with a research objective of probable interrelation of two or more variables. (Kokorina, 2007)

Functional communication is a communication at which all ratios are established in the determined form that is it is assumed that if two variables interconnected, answer any preset value of one variable only one value of the second. For functional communication that changes of a productive sign are entirely caused by action of a factorial sign is characteristic. This communication is represented by means of mathematical model and is expressed by the equation:

$$y = f(x),$$

where y – the corresponding indicator;

f (x) - the functional communication determined by an indicator x.

Feature of functional communication is that it is shown with an identical force for each unit of population which is studied. Therefore, having established when studying any unit of population this or that regularity, it can be extended both to each unit, and to all set. Correlation communication is a communication where influence of separate factors is shown only as a tendency at mass supervision of actual data. Data which gather for carrying out the regression analysis, usually represent "historical" data that is figures which show value of any of factors in any of the previous periods of time or geographical areas. They are used for receiving estimates of coefficients of regression and definition of degree of compliance of model of the corresponding reality to changes of a productive sign. It is possible to characterize dependence of a variation of a productive sign on a sign factor variation by means of exponents of narrowness of communication. Knowing indicators of narrowness of correlation communication, it is possible to solve the following groups of questions: The first question - to answer a question of need of studying of this communication between signs and expediency of its practical application. The second question - comparing indicators of narrowness of communication for various situations, it is possible for a sudiya, about degree of distinctions in its manifestation for specific conditions. The third question - comparing indicators of narrowness of communication of a productive sign with various factors, it is possible to reveal those factors which in these specific conditions are rekshayushchy and mainly influence formation of size of a productive sign. The most perfect exponent of narrowness of communication is the linear coefficient of correlation. At calculation of this indicator signs of deviations of individual values of a sign from average, and the size of such deviations are considered. However it is impossible to compare among themselves received absolute values as signs can be expressed in different units, and in the presence of the same units of measure averages can be various in size. In this regard the deviations expressed in relative sizes, i.e. in shares of an average quadratic deviation can be subject to comparison.

The mean square deviation is determined by a formula:

$$\overline{Z} = \sqrt{\frac{\sum (y - yx)^2}{n}} \,,$$

where $\overline{Z}$ - a mean square deviation;

у и ух — the actual and settlement sum arrived respectively;

n - number of cases of supervision.

The coefficient of a variation represents percentage of a mean square deviation to the arithmetic-mean size of a reporting indicator (profit).

$$K_s = \frac{\pm \overline{Z}}{\overline{y}} \times 100 \,,$$

where $\overline{Z}$ - a mean square deviation;

y - the arithmetic-mean size of profit, thousand rubles.

If the coefficient of a variation shows that the deviation of settlement pokakzatel from the actual makes insignificant size, до вы¬вод that this model can be used for planning of financial resources. Studying of correlation dependences is based on research of such communications between variables at which values of one variable "on the average" change depending on what values accepts other variable considered as the reason in relation to a dependent variable. Action of this reason is carried out in the conditions of difficult interaction of various factors owing to what manifestation of regularity is darkened by influence of accidents. Calculating average values of a productive sign for this group of values of a sign factor, we partly eliminiruy influence of accidents. Calculating parameters of the theoretical communication line, their further elimination is made and Y change with change of a factor by X turns out unambiguous (in a form). Thus, the expected model of interrelation of volume of output, expenses and profit is the action program of the organization establishing interrelation of volume of output, expenses and profit for increase of economic efficiency of the city-forming enterprise. For creation of model we will group indicators of volume of output, expenses and arrived to JSC Shadrinsk Automodular Plant - the city-forming enterprise of the city of Shadrinsk for 2011-2013 (Table 1).

| Period | Output volume | Costs | Profit on sales |
|---|---|---|---|
| 2011 | 272421 | 760752 | -488331 |
| 2012 | 391333 | 1185933 | -794600 |
| 2013 | 483670 | 430009 | 53661 |

***Table 1 -*** *Group of indicators for expected model of interrelation of volume of output, expenses also arrived to JSC Shadrinsk Automodular Plant* ***Source:*** *financial statements of JSC Shadrinsk Automodular Plant*

We will construct economic-mathematical model:

We will enter designations:

Y – Profit on sales;

X1 - Output volume;

X2 - Costs,

The model of communication includes two parameters therefore the linear equation has an appearance:

$$\bar{y} = a + b_1 x_1 + b_2 x_2$$

System of the normal equations for finding of parameters the following:

$$\begin{cases} na + b_1 \sum x_1 + b_2 \sum x_2 = \sum y \\ a \sum x_1 + b_1 \sum x_1^2 + b_2 \sum x_2 \cdot x_1 = \sum yx_1 \\ a \sum x_2 + b_1 \sum x_1 \cdot x_2 + b_2 \sum x_2^2 = \sum yx_2 \end{cases}$$

| № | Y | X1 | X2 | $X_1^2$ | $X_1X_2$ | $YX_1$ | $X_2^2$ | $YX_2$ |
|---|---|----|----|---------|----------|--------|---------|--------|
| 1 | -488,331 | 272,421 | 760,752 | 74213,201 | 207244,821 | -133031,619 | 578743,606 | -371498,785 |
| 2 | -794,600 | 391,333 | 1185,933 | 153141,517 | 464094,719 | -310953,202 | 1406437,080 | -942342,362 |
| 3 | 53,661 | 483,670 | 430,009 | 233936,669 | 207982,453 | 25954,216 | 184907,740 | 23074,713 |
| ∑ | -1229,270 | 1147,424 | 2376,694 | 387078,186 | 672077,172 | -284998,986 | 1591344,821 | -919267,649 |
| Average | -614,635 | 573,712 | 1188,347 | 193539,093 | 336038,586 | -142499,493 | 795672,410 | -459633,824 |

***Table 2*** *- The calculation table for determination of parameters of the equation of regression **Source**: financial statements of JSC Shadrinsk Automodular Plant*

$$\begin{cases} 3 \cdot a + 1147,424 \cdot b_1 + 2376,694 \cdot b_2 = -1229,270 \\ 1147,424 \cdot a + 387078,186 \cdot b_1 + 672077,172 \cdot b_2 = -284998,986 \\ 2376,694 \cdot a + 672077,172 \cdot b_1 + 1591344,821 \cdot b_2 = -919267,649 \end{cases}$$

The decision of system of the equations gives the following model of interrelation of volume of output, expenses and profit:

$$\widehat{y} = 0 + 1x_1 - 1x_2$$

For comparison of a role of separate factors in model of interrelation of volume of output, expenses and profit elasticity coefficients are defined. Calculation of averages is made in Table 2.

Calculation of coefficients of elasticity:

for output volume: $\quad \Theta_1 = b_1 \cdot \dfrac{\bar{x}_1}{\bar{y}} = 1 \cdot \dfrac{573,712}{614,635} = 0,9334$

for expenses: $\Theta_2 = b_2 \cdot \dfrac{\bar{x}_2}{\bar{y}} = -1 \cdot \dfrac{1188,347}{614,635} = 1,9334$

Therefore, at increase in volume of output at 1% the profit on sales will increase by 0,9334%. The increase in expenses at 1% will reduce profit on sales by 1,9334%.

Calculations of interrelation of volume of output, expenses and profit for JSC Shadrinsk Automodular Plant provide three options. The first option provides application of established price of production and indicators of sales volume and expenses of 2013 (conservative). The second option provides increase in the price of production at 10% without change of sales volume and expenses (moderate and optimistical). The third option provides reduction of the price of production by 10% without change of sales volume and expenses ((forced).

As a result of the carried-out calculations it is received that at the change in price and at invariable indicators of volume and size of expenses the marginal income and size of profit on production realization changes. The carried-out calculations showed that JSC Shadrinsk Automodular Plant will get the greatest profit at sale of 195028 units of production at the change in price for 10%. Thus, by results of an assessment of indicators of interrelation of volume of output, expenses and profit it is possible to draw the following conclusion. In model of interrelation of volume of output, expenses and profit the increase in volume of release in 2014 for 10% is possible due to increase of the price for 10% and application to calculation of the price of valuable approach.

Therefore, level of efficiency of the developed expected model of interrelation of volume of output, expenses and profit the high. The expected model has probabilistic character, and during its formulation it is impossible to expect all opportunities which will appear when developing the program of concrete actions.

# Youth Unemployment in 21st Century: The Turkish Case

Asst. Prof. Dr. Kamil Necdet Ar (Okan University, Turkey)

## Abstract

The main aim of this paper is to discuss the global youth unemployment problems and review the present situation throughout the World. Youth unemployment is a worldwide severe socio-economic problem today and may develop worse in coming years, unless effective measures are taken. Sorts of inequality which affecting youth unemployment exists throughout the world between rich and poor nations and various social layers of society and all of these waiting solutions. The dimensions of the youth problem is widening in many countries. The proportion of youth unemployment is increasing due to wrong economic and population policies. To tackle all these problems requires new strategies and policies based on fresh visions. In this respect Turkey can be case to review. The dimensions of the youth problem in Turkey is widening like many other developing countries. The proportion of youth unemployment is increasing due to wrong policies. The Turkish is economy cannot support a large growing population under the present circumstances. Also the Turkish education system has to be restructured in order to meet the needs of national and the global labour market demands. In order to solve youth unemployment problems in Turkey, prudential and scientific based policies are to be introduced.

## 1  Introduction

For insight into this topic, the global socio economic outlook at the beginning of the 21 century should be reviewed. Extracts from the UN Secretary's 2000 Millennium Report is depicted are provided as follows.

"There are also many things to deplore and to correct. The century just ended was disfigured, time and again, by ruthless conflict. Grinding poverty and striking inequality persist within and among countries even amidst unprecedented wealth. Diseases, old and new, threaten to undo painstaking progress. Nature's life-sustaining services, on which our species depends for its survival, are being seriously disrupted and degraded by our own everyday activities.

The greatest challenge we face today is to ensure that globalization becomes a positive force for all the world's people, instead of leaving billions of them behind in squalor. Inclusive globalization must be built on the great enabling force of then market, but market forces alone will not achieve it. It requires a broader effort to create a shared future, based upon our common humanity in all its diversity. Inclusive globalization must be built on the great enabling force of the market, but market forces alone will not achieve it. It requires a broader effort to create a shared future, based upon our common humanity in all its diversity" (UN, 2000;19-20).

Here we do not see a promising picture. The new capitalist ideology called "globalization" has been in control of the global economy and affairs. However sorts of inequality exists throughout the world between rich and poor nations and various social layers of society. As mentioned in the report, market forces alone will not achieve a fair distribution of wealth and evenly developed societies today and in coming decades unless legitimate social forces intervene. As can be seen in the report the world is witnessing very unfavourable conditions in the 21st century such as poverty, unemployment, and income inequality. This inequality is growing between the developed and underdeveloped countries, regions and different socio-economic layers in many countries.

In this picture if we focus on youth some international studies such as ILO reports will be useful. According to the recent ILO reports, the world is facing a worsening youth employment crisis: young people are three times more likely to be unemployed than adults and more than 73 million youth worldwide are looking for work. The ILO has warned of young workers facing a dangerous mix of high unemployment, increased inactivity and precarious work in developed countries, as well as persistently high working poverty in the developing world (ILO 2013;7). To continue this subject some useful terminology should be reflected.

## 2  Relevant UN Definitions of Unemployment

In International Labour Organization (ILO) terminology the definition of unemployment is follows;

 "The unemployed comprise all persons above a specified age who during the reference period were:

-without work, that is, were not in paid employment or self-employment during the reference period;

-currently available for work, that is, were available for paid employment or self-employment during the reference period; and

- seeking work, that is, had taken specific steps in a specified recent period to seek paid employment or self-employment" (ILO,1982; para10). If specified for youth the unemployment rate is defined as the number of unemployed youth (typically 15-24 years) divided by the youth labour force (employment+unemployment) (ILO, 2013).

## 3 Globalization and Unemployment

Globalization has enormous scope to include economic, political, security, environmental, health, social, cultural. Globalization involves not only benefits, but also conflicting interests. This could lead to conflicts of various types at regional, national or international level. One such cost or problem concerns who gains from its potential benefits. There can be substantial inequity in the distribution of the gains from globalization among individuals, impacting individuals, organizations, nations, and regions. Indeed, many of the gains have been going to the rich nations or individuals, creating greater inequalities and leading to potential conflicts nationally and internationally (Ar, 2007; 240-258, Intriligator, 2003;8) For instance the inequality ratio between the richest and poorest countries grew from 1/11 in 1913 to 1/44 in 70s, to 1/ 94.3 in 2005 (UN, 2005; 45).

A second problem stemming from globalization is that of major potential regional or global instabilities stemming from the interdependencies of economies on a worldwide basis. There is the possibility that local economic fluctuations or crises in one nation could have regional or even global impacts (Intriligator;10). An example of this is the "US mortgage crisis" and the "Lehman bankruptcy of 2008" that had global impact. However national policy and technological trends are as important determinants of employment as globalization. The other potential impact of globalization is a diminishing social state and the emergence of complex and interdependent processes over which the state has no control. As proven over time, the recycling economic and financial crisis cannot be prevented by globalization.

After having mentioned all these, in the fifth year after the outbreak of the global financial crisis, global growth has decelerated and unemployment has started to increase again, leaving an accumulated total of some 197 million.

New recession conditions in Europe have been spilling over globally. Lower economic activity and job growth even in countries that had initially escaped these condwave of the crisis constitutes a spillover effect of the weak growth in advanced economies in 2012, in particular in Europe. So far, the main transmission mechanism of global spillovers has been through international trade, but regions such as Latin America and the Caribbean have also suffered from increased volatility of international capital flows that have forced them to quickly adjust their macroeconomic policy in order to dampen the effects on exchange rates, there by weakening their domestic economies.

Above all; the youth unemployment problem is worse than many others. The UN Report emphases the youth employment situation in the following words.

"The world faces a major challenge of youth unemployment—and it is liable to get even worse with the coming youth bulge. According to International Labour Organization estimates, 60 million young people are searching for work but cannot find any; about 80 per cent of them are in developing countries and economies in transition. Those in the 15 to 24 age cohort are nearly twice as likely to be unemployed as adults; in some developing countries the ratio is higher. Young workers are also more likely than older ones to be last hired, first fired; and they are less likely to be protected by legislation. Joblessness among the young can be devastating, and governments have tried, in a number of ways, to deal with it. But policies targeted at young people, including preferential hiring, have proved largely unsuccessful for the simple reason that they are economically unsustainable" (UN, 2000;20-21). Youth make up 17% of the world's population. There are 1.2 billion youth in the world aged between 15 and 24. 87% of youth live in developing countries. (UN, 2012).

Worldwide 202 million people is unemployed. Among that youth make up 40% of the world's unemployed .Global Adult Unemployment Rate is 4.5% (ILO, May 2012). Global Youth Unemployment Rate is 12.6%. In 2011, youth's risk of being unemployed was 3 times higher than that of an adult (ILO, Youth Trends 2012). A total of 357.7 million youth were not in education, employment, or training (NEET) in 2010, and the number is increasing (World Bank, 2012).

As can be observed job situation for youth is very problematic. What worsens unemployment problem and why are the number of jobs created by economies falling so short of meeting the needs of the jobless, in particular the youth? What impact is the globalization process having on this phenomenon?

The main effects of the process of globalization on the labor market are threefold: it increases the substitutability of capital and labor –as the potential for specialization is increased-; it broadens the technological menu by facilitating international technology transfers and it implies a more or less instantaneous obsolescence of real and human capital employed in non-competitive activities. This implies the automatic unemployment of the human resources associated with that portion of capital stock which suddenly becomes obsolete. Although globalization can improve productivity, investment, and growth, it may not benefit employment and even reduce the earnings of workers" (Beker; 1998).

When these statements are translated, it can be said that with instant information and communication, virtually everything is available to anyone, anywhere. Markets are now global and many corporations are often richer and more powerful than many countries. More in underdeveloped countries but overall the globalization process weakened, destroyed the functions of the social state, public surveillance, and control over corporations.

International or supranational companies is now in control of global economy and resists any public interference based on social concerns.

## 4   World Youth Unemployment in 21. Century

If we look to the young jobless problem with the perspective outlined above, the global youth unemployment rate, estimated at 12.6 per cent in 2013, is close to its crisis peak. As many as 73 million young people are estimated to be unemployed in 2013. Meanwhile, informal employment among young people remains pervasive and transitions to decent work are slow and difficult. The economic and social costs of unemployment, long-term unemployment, discouragement and widespread low-quality jobs for young people continue to rise and undermine economies' growth potential (ILO,2013;1) .

As observed in recent international documents youth unemployment is spreading and causing social problems throughout the world. The last ILO document "GLOBAL EMPLOYMENT TRENDS FOR YOUTH 2013" has such a title "A Generation at Risk". Even this title emphases the seriousness of the problem.

Since the unprecedented increase in youth unemployment between 2008 and 2009, the global youth unemployment rate has remained at very high levels. From 2009 to 2011 the youth unemployment rate decreased from 12.7 per cent to 12.3 per cent. It increased again to 12.4 per cent in 2012 and has continued to grow to 12.6 per cent in 2013. This is 1.1 percentage points above the 2007 level of 11.5 per cent. Global youth unemployment is estimated to be 73.4 million in 2013, which is an increase of 3.5 million since 2007 and 0.8 million above the 2011 level (ILO,2013;7).

The global economic crisis caused a massive reduction in jobs, often concentrated in only a small number of sectors. As a result, ever more young unemployed have been forced to consider jobs in sectors or occupations in which they did not work previously, or had not envisaged before entering the labour market. A mismatch may therefore exist between the skills these young people possess and the skills that are demanded by prospective employers. Such a mismatch between skills supply and demand hampers the reallocation of labour and puts upward pressure on unemployment rates (ILO, 2013;21).

The figures in the following shows youth unemployment between the years 2005-2011 in some selected countries. Table 1 displays that youth unemployment is in an unfavourable situation throughout the world. The figures of some selected countries from various geography, development standards and population indicate that even in developed countries youth unemployment is a serious problem.

| Country | Employment Rate To Population | Youth Unemployment Rate (%) | Country | Employment Rate To Population | Youth Unemployment Rate (%) |
|---|---|---|---|---|---|
| Norway | 65,9 | 9,3 | Argentina | 62,6 | 22,2 |
| Australia | 62,4 | 11,9 | Russian Federation | 62,8 | 15,7 |
| United States | 61,2 | 18,7 | Mexico | 63,9 | 10,4 |
| Netherlands | 61,5 | 7,8 | Kazakhstan | 75 | 5 |
| Germany | 57,2 | 9,1 | Brazil | 68,2 | 23,1 |
| Japan | 59,7 | 8,9 | Turkey | 48,8 | 20,7 |
| Canada | 62,7 | 15,9 | Thailand | 76,9 | 3 |
| France | 54,4 | 23,2 | Pakistan | 55,4 | 10,5 |
| United | 58,8 | 58,8 | World Average | 65,8 | 65,8 |

***Table 1.****Youth Unemployment in Selected Countries;* ***Source:*** *Global Employment Trends for Youth 2013, ILO, Geneva, 2013, pp. 174-177.*

The jobs crisis pushes more and more women and men out of the labour market. Labour force participation has fallen dramatically, in particular in advanced economies, masking the true extent of the jobs crisis. As a consequence, the employment- to-population ratio has fallen sharply. In this context, youth remain particularly affected and remain particularly stricken by the crisis. In the 2013, some 73.8 million young people are unemployed globally and the slowdown in economic activity is likely to push another half million into unemployment by 2014.

The youth unemployment rate –which had already increased to 12.6 per cent in 2012 – is expected to increase to 12.9 per cent by 2017. The crisis has dramatically diminished the labour market prospects for young people, as many experience long-term unemployment right from the start of their labour market entry, a situation that was never observed during earlier cyclical downturns (ILO,2013;11). As an example to the decreasing labour force participation and unemployment rates the employment related statistics is laid down in the following.

| Years | Youth Unemployment (Millions) | Youth Unemployment Rate (%) |
|---|---|---|
| 1992 | 65,4 | 10,9 |
| 1994 | 66,5 | 11,4 |
| 1996 | 68,5 | 11,9 |
| 1998 | 70,0 | 12,3 |
| 2000 | 71,2 | 12,7 |
| 2002 | 75,8 | 13,0 |
| 2004 | 76,8 | 12,8 |
| 2006 | 74,9 | 12,3 |
| 2007 | 69,9 | 11,5 |
| 2008 | 70,4 | 11,7 |

**Table 2.** *Global Youth Unemployment and Unemployment Rates, 1991–2013;* **Source:** *Global Employment Trends for Youth 2013, p.8.*

Table 2 depicts that under the present global socio-economic conditions which are structured by the global economic powers, the youth unemployment is bouncing up and down .The system in essence has financial and economic crisis recycling within a frequency. As can be seen 10.9 percent youth unemployment in 1992 goes up to 13 percent in 2000 and slides down to 11.5 percent in the coming year and starts to rise again. This picture shows that no realistic remedy to correct the malfunctioning system has been introduced so far and a high rate of youth unemployment has gained a permanent feature. The situation after 2008 is in the following.

| Labour Force Participation Rate (%) | | | | |
|---|---|---|---|---|
| Years | 2009 | 2010 | 2011 | 2012* |
| | 60,5 | 60,3 | 60,0 | 60,0 |
| Unemployment Rate (%) | | | | |
| Total | 8;4 | 8;8 | 8;4 | 8;6 |
| Youth | 17;4 | 18;1 | 17;6 | 17;9 |

**Table 3.** *Labour Market Situation and Outlook (World);* **Source:** *Global Employment Trends2013, ILO Geneva, 2013, p.45. * Projection*

Table 3 indicates that after 2008 financial crisis, slight but a steady decline in labour force participation is observed. Youth unemployment rate is high through the period. The problem of an increasing detachment from the labour market is particularly severe among younger people who have been particularly hard hit by the crisis. In the Developed Economies region, youth unemployment rates have risen substantially with the crisis and have not shown signs of improvements since. As recessionary conditions have taken hold of most European countries again, youth unemployment has further increased, reaching more than 50 per cent of young active people in countries such as Greece and Spain and more than 22 per cent in the Euro area overall (ILO,2013,;47). Youth unemployment rate exceeds 15 per cent in two-thirds of advanced economies. Some statistics are in the following.

| Country | 2008(%) | 2012(%) | Country | 2008(%) | 2012(%) |
|---|---|---|---|---|---|
| Switzerland | 8 | 6 | Portugal | 17 | 38 |
| Germany | 12 | 8 | Poland | 18 | 25 |
| Japan | 8 | 8 | Canada | 11 | 15 |
| United States | 12 | 16 | Greece | 20 | 53 |
| United Kingdom | 17 | 20 | Spain | 24 | 51 |
| France | 19 | 22 | Italy | 22 | 32 |
| Sweden | 21 | 22 | OECD Countries | 12 | 16 |
| | | | Euro Area (17 Countries) | 15 | 21 |

**Table 4.** *Youth Unemployment Rates in Selected Countries 2008 and 2012 (Second Quarter, %);* **Source:** *Global Employment Trends for Youth 2013, p. 11*

As observed from the table youth unemployment is showing a very sharp increase in some countries such as Spain, Greece, Portugal, Italy. Overall the youth unemployment in the selected countries proves an upward tendency.

So far we have gone through a brief worldwide search on youth unemployment situation. The findings show that the global capitalism has reached to a peak after the fall of socialist bloc and globalization gained huge momentum. International capital has overcome largely over all national supervision and control and gained extreme flexibility between national boundaries and international velocity. However the opponent partner labour

does not have the same mobility and flexibility as the capital system. Social systems have become obsolete by the pressure of the prevailing extreme capitalist approach .Technological developments which use machines in place of manpower are causing wide scale unemployment and specifically youth unemployment. International corporations dislike social state structures and supervision which have mainly been the support structure for the labour force and the less fortunate. Economic and financial crisis cause adverse impact on unemployment and social security systems in many countries. No doubt, the socio-economic impact on developing (or underdeveloped) countries is much heavier than the developed ones. In this respect Turkey could be an example for brief case research.

## 5  Youth Unemployment in Turkey

Unemployment; youth total (% of total labor force ages 15-24) in Turkey was last measured at 18.7 in 2013 (22.0 nonagricultural unemployment rate), according to the Turkish Statistical Institute (TurkStat). As mentioned above youth unemployment refers to the share of the labor force ages 15-24 without work but available for and seeking employment. Definitions of labor force and unemployment differ by country. This part has the latest values, historical data, statistics and evaluations for Unemployment - youth total (% of total labor force ages 15-24) in Turkey.

ILO report states that there are 73.8 million young unemployed people in the world. The rate of youth unemployment in Turkey is more than twice the world average. Before looking at beyond 2000, a review of some information covering different periods would be useful. Some vital statistics of the Turkish Statistics Institute (TURKSTAT) pertaining to youth labour and unemployment are in the following.

| Years | Unemployment (%) | | | | Non-agricultural Unemployment (%) | | |
|---|---|---|---|---|---|---|---|
| | Total | Male | Female | | Total | Male | Female |
| 1989 | 17;2 | 17;8 | 17;2 | | 29;0 | 25;1 | 40;3 |
| 1991 | 17;0 | 19;2 | 13;2 | | 30;0 | 27;8 | 40;0 |
| 1993 | 18;2 | 18;6 | 15;5 | | 29;9 | 27;2 | 37;8 |
| 1995 | 15;3 | 15;7 | 14;6 | | 23;5 | 20;3 | 33;3 |
| 1997 | 15;2 | 13;9 | 17;7 | | 23;1 | 19;1 | 33;8 |
| 1999 | 15;2 | 15;0 | 15;4 | | 22;6 | 22;6 | 30;8 |

**Table 5.** *Youth Unemployment Rates of "15-24 age group" by years and sex (1988-1999);* **Source:** *Turkish Statistical Institute (Turkstat) household labour force survey.*

As observed from the above figures which belong to the last decade before the year 2000, the youth unemployment rates fell both in total and in non-agricultural unemployment figures. This period is the continuation of the centralization period and the Turkstat statistics show a high urbanization ratio in Turkey.

| Year | Total | Urban Population | Urban/Rural Ratio |
|---|---|---|---|
| 1985 | 50.664.458 | 26.865.757 | 53 |
| 2000 | 67.803.927 | 44.006.274 | 64.9 |

**Table 6.** *Population Status (1985-2000;* **Source:** *TURKSTAT, Population of Province and district centers.*

The table reflects a population boom in cities during the 15 year period. When compared with Table 5, it looks that in the last decade before 2000, job creation by industry and service sector in urban areas could absorb the population growth till to an extent. However this does not take into consideration the growing jobless rate of the youth labour force. When evaluating the total workforce in Turkey and the population increase, in essence it can be said that the number of unemployed youth increased. The youth labour force participation can be viewed in the following.

| Years** | Labour Force (LF) * | | | | LF Participation Rate (%) | | |
|---|---|---|---|---|---|---|---|
| | Total | Male | Female | | Total | Male | Female |
| 1988 | 5.653 | 3.846 | 2.167 | | 56.0 | 73.2 | 40.6 |
| 1989 | 5.398 | 3.262 | 2.236 | | 55.1 | 70.6 | 41.3 |
| 1991 | 6.200 | 3.898 | 2.302 | | 54.4 | 69.9 | 39.6 |
| 1993 | 5.286 | 3.837 | 1.989 | | 48.8 | 65.8 | 32.5 |
| 1995 | 6.137 | 3.939 | 1.878 | | 49.5 | 65.0 | 34.7 |
| 1997 | 6.137 | 3.950 | 1.653 | | 47.1 | 63.8 | 31.1 |
| 1999 | 5.278 | 3.702 | 1.715 | | 45.1 | 59.5 | 31.2 |

**Table 7.** *Labour Force Participation of "15-24 age group" by Years and Sex (1988-1999);* **Source:** *TURKSTAT, household labour force survey *1000 **Shows the figures of October of each year*

According to the Table 7, the working young population between the beginning and at the end of the 12 year period shows a considerable decline. The total figures reflected above indicate an11 percent decrease during the 12 year period. Male participation rate drops roughly 14 percent and female participation drops roughly 9 percent. All these facts indicate a diminishing youth labour force participation, although the population of "15-24" years of age rose from 10.093 to 12.701 between the years 1988-1999.This picture shows us a large downgrade at youth labour force participation and economy had not been capable of creating sufficient jobs for the growing young population. So to say the problem goes back before the year 2000. Similar statistics going beyond 2000 are also to be looked at.

| | Unemployment (%) | | | Non-agricultural Unemployment (%) | | |
|---|---|---|---|---|---|---|
| Years | Total | Male | Female | Total | Male | Female |
| 2000 | 13.1 | 13.7 | 11.9 | 19.0 | 28.0 | 21.7 |
| 2002 | 19.2 | 20.3 | 17.1 | 26.6 | 25.3 | 29.8 |
| 2004 | 20.6 | 20.5 | 20.7 | 26.6 | 24.7 | 31.1 |
| 2006 | 19.1 | 19.3 | 20.6 | 22.5 | 20.2 | 28.1 |
| 2008 | 20.5 | 26.3 | 21.2 | 24.2 | 22.3 | 28.1 |
| 2010 | 21.7 | 21.0 | 23.0 | 22.9 | 21.0 | 26.1 |
| 2012 | 19.8 | 19.0 | 19.9 | 22.9 | 21.0 | 26.1 |
| 2013 | 18.7 | 17.0 | 21.9 | 22.0 | 19.0 | 28.4 |

**Table 8.** *Youth Unemployment Rates of "15-24 age group" by years and sex, (2000-2004);* **Source:** *Turkish Statistical Institute (Turkstat) household labour force survey.*

Since the share of agriculture in Turkish economy has declined largely and there is not high unemployment in the agriculture sector in Turkey. The main reason for this, is the widespread family business and labour in the sector. Therefore the real youth unemployment situation can better be monitored by non-agricultural figures. After mentioning that, it should stressed that the youth unemployment figures covering the period 2000-2013 shows a serious increase according to the last decade figures of the Turkish Statistics Institute (TURKSTAT). Youth non-agricultural unemployment rate in Turkey fluctuates around 20- 26 percent level. In other words, one out of four youths is unemployed. The rate of youth unemployment in Turkey is more than the world average. The crisis hit the youth more than it hit the adults. When the reducing labour force participation is added to TURKSTAT unemployment rate figures there should not be any doubt that the real youth unemployment is much higher than 20-25 percent range. By stating that statistics which are to be linked to unemployment rates are in the following.

| | Labour Force (LF) * | | | LF Participation Rate (%) | | |
|---|---|---|---|---|---|---|
| Years | Total | Male | Female | Total | Male | Female |
| 2000 | 5.401 | 3.317 | 1.821 | 42.5 | 57.6 | 28.1 |
| 2002 | 5.116 | 3.259 | 1.857 | 40.9 | 53.3 | 29.0 |
| 2004 | 4.474 | 2.954 | 1.520 | 37.8 | 51.3 | 25.0 |
| 2006 | 4.365 | 2.908 | 1.458 | 37.4 | 51.1 | 20.6 |
| 2008 | 4.381 | 2.905 | 1.477 | 38.1 | 51.7 | 25.1 |
| 2010 | 4.425 | 2.872 | 1.554 | 38.4 | 50.9 | 26.3 |
| 2012 | 4.442 | 2.910 | 1.512 | 38.2 | 50.8 | 25.9 |
| 2013 | 4.584 | 2.981 | 1.603 | 39.6 | 51.9 | 27.5 |

**Table 9.** *Labour Force Participation of "15-24 age group" by years and sex (2000-2004);* **Source:** *Turkstat, household labour force survey.* 1000*

Table 9 indicates a serious decline in the number of youth labour force and participation rate. Once all these facts are taken into account it can be said that there is an obvious and serious reduction in youth employment status in 21st century. The other outstanding issue drifted by these figures the very low young female labour force participation and a double high female unemployment rates compare to male.

It has been customary that female employment in urban agricultural sector has a large scale. However after a fast centralization process, females could not easily participate in industry as workers because of social and cultural pressures which conditioned them in their previous rural life style. For instance to be an industry worker as female in Turkey has usually been disturbing in a man dominated social environment conditioned by old fashioned Middle East mentality.

## 6    Contributing Factors to youth unemployment in Turkey

The highest unemployment is witnessed in the 20-24 age group almost in every country. The lack of experience of new jobseekers, insufficient time to find a job and recent university graduates' high fee expectations can be specified as some factors affecting youth unemployment among others. However there are

other important factors affecting unemployment. There are various contributing factors to high youth unemployment in Turkey. A major one is high birth ratio. Some related statistics are in the following.

| Years | 2001 | 2005 | 2008 | 2011 |
|---|---|---|---|---|
| Fertility Rate | 2.37 | 2.12 | 2.16 | 2.02 |
| Number of Births | 1.232.288 | 1.243.883 | 1.294.227 | 1.241.412 |
| Number of Deaths | | | 368.884* | 357.367 |

***Table 10.*** *Birth Fertility Rate in Turkey (2001-2011). *2009;* **Source:** *Turkstat, Vital Statistics, Basic fertility and mortality indicators.*

Although a slight slowdown in fertility rate is seen above, still population increase trend is high in Turkey. Each year roughly 1 million is added to the total specifically to young population. The dynamics of economy is not capable of creating jobs for the present jobless let alone for the new participants. Despite these facts, the present regime is encouraging an increased birth rate through political speeches (Hürriyet Newspaper March 2008). Examples are the "have at least three children campaign", and government consideration of an early retirement benefit for women who have three or more children .It is very likely that having so many children creates a huge burden on poor families and mothers would have no realistic opportunity to join the labour market.

Another factor related to the young unemployment could be the change in the economic structure. The relevant statistics are in the following.

| Years | Agricultural | Industry | Services |
|---|---|---|---|
| 1998 | 12.5 | 32.6 | 51.7 |
| 2006 | 10.0 | 32.9 | 54.5 |
| 2012 | 9.3 | 32.9 | 57.6 |

***Table 11.*** *Gross Domestic Product by Kind of Economic Activity Sector Shares (%);* **Source:** *Turkstat Gross Domestic Product in Constant Prices by Kind of Main Activity (at 1998 Basic Prices).*

Table 11 shows that agricultural sector share in annual national revenue has declined for years. Industry share roughly remains unchanged. The share of services has grown considerably. Also TURKSTAT Statistics "Quarterly Production Workers Index of Manufacturing Industry" based on 1997=100 value shows a decline in manufacturing industry which can be perceived the main source of employment and income for labour. The index was 119. 3 in the year 1998, it shows 84.7 in the year 2008.

The facts shown above verify that the labour force released from agriculture and the new labour force participants have been moving to services sector rather than industry because of industrial stagnation. The findings collected from labour force statistics show that unless industrial production growth is realized, unemployment increase cannot be avoided. In this respect the economic policies which have been applied for many years do not serve the aim of an industry production weighted economic structure.

Another survey which was held in 2006 indicates the relationship between education and unemployment. The figures can be viewed below.

| Labour Force | | | | |
|---|---|---|---|---|
| Age Group | Illiterate | Less Than High School | High School | Higher Education |
| 15-19 | 2.3 | 70.8 | 26.4 | 0.5 |
| 20-24 | 1.6 | 50.6 | 34.4 | 13.4 |
| 25-29 | 1.4 | 48.8 | 31.6 | 18.1 |
| 15+ | 5 | 61 | 21.6 | 12.4 |
| Employed | | | | |
| 15-19 | 2.5 | 73.2 | 24.0 | 0.4 |
| 20-24 | 1.7 | 53.0 | 33.2 | 12.1 |
| 25-29 | 2.3 | 21.5 | 48.5 | 27.6 |
| 15+ | 5.3 | 61.4 | 20.9 | 12.4 |
| Unemployed | | | | |
| 15-19 | 1.4 | 59.8 | 38.5 | 1 |
| 20-24 | 1 | 40.9 | 39.5 | 18.5 |
| 25-29 | 2.8 | 63.4 | 22.2 | 11.6 |
| 15+ | 2.2 | 57.7 | 28.1 | 12 |

***Table 12.*** *The Educational Status of the Labour Force (%) 2006;* **Source:** *Yentürk Nurhan, Başlevent Cem; Youth Unemployment in Turkey, Istanbul Bilgi University Survey Unit, 2006.*

As seen above high school and higher education graduates of the 20-24 age group face higher unemployment than the adults' high school and college graduates. Being a college graduate does not constitute an advantage and may not be useful for finding jobs in future years.

## 7 Conclusions

Youth employment policy must be designed with the limitations imposed by economic conditions in mind. The problem of youth unemployment cannot be tackled in isolation from the wider macro-economic problems.

The World has been witnessing many recycling financial and economic crisis for many years and especially in recent decades. The new era is called global world and the global ideology is called "globalization". In this system many problems are international, because the economy and money governing powers are global. In this context all socio-economic problems faced in different parts of world are linked to each other in a large scale. Therefore problems such as unemployment in particular youth unemployment is a global problem and the remedies should not be left to a single nation or society. The cooperation, coordination, solidarity between governments, international institutions, organizations are not as vigorous as global capital which seeks low wages to make profit at the expense youth or child abuse throughout the World.

Since the beginning of industrial revolution, the struggle between capital and labour came to a halt after the construction of social state, or welfare state in the second half of 20th century. Nevertheless globalization has gained momentum after the collapse of Soviet Bloc. Globalization in essence is against any state or social interference and the control of world has been moving to the hands of international capitalism. All national social systems and regulations protecting labour against capital and providing a balance between them are being deregulated by inventing several ways. As proved so far the present global system in this nature and structure is a big failure to bring solutions to poverty, inequality, unemployment and to rectify the worldwide social malfunctions. Thus a serious and a strong will of the international community is needed to end several social problems including youth problems.

Youth unemployment is by no means spread evenly across the youth population. Programmes need to be aimed at those young people who are in most need of help in order to counter the dangers of social exclusion of specific groups. Youth unemployment is also particularly associated with drug abuse and crime. Both forms of behaviour which tend to be persistent and which have high social as well as individual costs.

The whole scale introduction of training programmes for young people will do little more than temporarily ease the problem for that group unless measures are taken to ensure that they will be taken on by employers at the end of schemes. Failure to do so may be worse than doing nothing in as much as participation on such schemes may raise the expectations of young participants which are doomed to disappointment if wider ranging policies are not introduced.

To struggle with worldwide and especially with youth problems need new international organizations with fresh and new visions. The influential international organizational structure such as World Bank, IMF and others are all the tools of finance world. Therefore international organizational structure is to be relooked by considering and giving high priority to youth related concerns.

Regarding to Turkey as discussed in this paper youth unemployment is much higher than EU and world average. Male or female youth unemployment in Turkey for many years has been double as adult. To reduce youth unemployment, there is no adequate policies implemented in Turkey. That arise from this environment for young people, young women are more adversely affected. Young people and especially young women-specific policies designed to reduce unemployment would be appropriate.

Firstly Turkey needs to have a youth employment strategy discussed with all parties concerned. When non-agricultural is concerned the adult unemployment rate in 2013 is 12.0 percent and labour force participation is 45.5 percent. The youth non-agricultural unemployment rate in 2013 is 22 percent and youth labour force participation rate is 39.6 percent. These rates of youth unemployment are large enough to require a combination of economic and social policies designed to combat them.

Turkey is in need of some macroeconomic reforms which will contribute to the youth unemployment problem. In this respect population boom is a major problem. The economic growth in 2012 is 2,2 percent . The fertility rate in 2011 is 2.02 percent. In this situation all economic growth is taken by population increase. As brief Turkish economy with a low labour force participation, high unemployment rates and not industry growing economy cannot tolerate a very high population growth. The economic growth in Turkey is not industry production based. Economic growth is not job creating. This problem is also be tackled by the cooperation of all parties rather than government imposed remedies.

Other issue is the education system. In Turkey, as the main cause of educated youth unemployment is the lack of cooperation between education and employment policies. (In the 2013-2014 curriculum year the number of student driven to religious schools is 451.000. Technical education receiving number of students is 491.000).

Double female unemployment rate in Turkey is another problem to be addressed. There is need to change the man domination mentality by eliminating social and cultural prejudices.

As conclusion, high rate of population increase, the mismatch between education and employment policies and poor job creating economic growth policies are to be corrected and among all of these reforms high priority should be allocated to the youth unemployment.

We need to go further than simply the aim of employing young people at any cost. We need also to look at the quality of work. Perhaps in times of high youth unemployment, the temptation is to look only at the quantitative effects. There is a need to balance the roles of building or maintaining attachment to the labour market with the desirability of promoting individual choice in the labour market.

# Comparative Analysis of Birth Rate and Life Expectancy in Macedonia, Turkey and the European Union

Prof. Dr. Trajko Miceski (Goce Delchev University, Macedonia)

Natasha Stojovska (Goce Delchev University, Macedonia)

## Abstract

The comparative analysis of birth rate and life expectancy will provide information about the position of Macedonia in relation to Turkey and the EU and also about the factors that have the greatest impact on the population's movement and vitality. This information should help the policy creators in the process of defining and implementing measures for increasing the birth rate and life expectancy of the population, which is aim of every country. In this paper will be put out some theoretical aspects about the economic, social, psychological, technological, cultural and political factors that have impact on the birth rate and life expectancy of the population. Also, the tabular and graphical displays will show the movement of these two demographic features in the period from 1980 to 2011. Changes in birth rate and life expectancy in Macedonia, Turkey and the European Union have been leading to demographic aging of the population in the last three decades. The birth rate in these countries shows a trend of continuous decline, despite the gradual increase in life expectancy of the population. Although the declined birth rate and increased life expectancy of the population have been a common features of these countries in the last decades, the percentage of this changes is different for each country.

## 1 Introduction

The statistical data aboutthe movement of global population points out the slower pace of its growth. Indeed, a trend of self-destruction, expressed through reduced birth rate of the world population is becoming more intensive. Inevitable consequences of this trend are reduced number of live births, on one hand and demographic aging of the population, on the other hand.

The problem with falling birth rates indicates several trends that have smaller or bigger contribution to this negative movement of the population. They appear as a consequence of modern living expressed through improved general living conditions, women's higher level of education and participation in the labor market, professional orientation of young population, advanced technology. In fact, the economic, social and cultural development is increasing the need for professional development, personal satisfaction and leisure time, on one hand, but also is reducing the desire for children, on the other hand. Consequently, there is a reduction innumber of live births, reductionin number of marriages and increasein number of divorces.

Increased life expectancy is a result of numerous factors, including clean water, better prenatal care,better nutrition, wider and more accessible healthcare, improved medicines, new drugs and technologies that allow prevention and earlier treatment of health problems. The trend of continuous increasing of life expectancy means that today the population over 50 years is becoming more numerous compared to the past.

## 2 Comparative Analysis of Birth Rate in Macedonia, Turkey and the European Union

The birth rate in Macedonia, Turkey and the EU countries is showing a trend of declining. With other word, there is a reduction in the number of live births per woman as a result of the impact of many factors. The development tendency of this demographic variable for each country i.e. communityofnations, is presented tabular and graphic.

Tabular and graphic displays show a significant decline in the birth rate in these countries in the last three decades. Despite past and current situation, the prediction for the future is also showing a declining movement, if the factors of influencewould not be identified and appropriate measures to overcome such situations would not be taken.

What we can first notice from the figure above is the trend of rapidly declining birth rate in the beginning of the analyzed period(especially in Turkey), than its slower decline in the second decade and stagnation or minimal decline in recent years. Despite this common trend, the percentage of change is different for each country. In Macedonia, the percentage of decline in the birth rate is 49.5%, in Turkey is 50.7 % and in the EU is 25.2 %. We can conclude that Turkey still has the highest birth rate of 17.4 live births per 1,000 inhabitants, despite its greatest fall in the analyzed period. On the second place is Macedonia with 10.9 live births per 1,000 inhabitants and the EU with 10.4 live births per 1,000 inhabitants is in the end, though the smallest percentage of change in the analyzed period.

| Year | Birth rate in Macedonia | Birth rate in EU | Birth rate in Turkey |
|------|-------------------------|------------------|----------------------|
| 1980 | 21,6 | 13,9 | 35,2 |
| 1981 | 21,3 | 13,5 | 34,5 |
| 1982 | 21,0 | 13,4 | 33,6 |
| 1983 | 20,7 | 13,1 | 32,7 |
| 1984 | 20,3 | 13,0 | 31,7 |
| 1985 | 19,9 | 12,8 | 30,7 |
| 1986 | 19,4 | 12,7 | 29,7 |
| 1987 | 19,0 | 12,8 | 28,6 |
| 1988 | 18,6 | 12,7 | 27,7 |
| 1989 | 18,3 | 12,4 | 26,8 |
| 1990 | 17,9 | 12,4 | 26,0 |
| 1991 | 17,4 | 12,0 | 25,4 |
| 1992 | 17,0 | 11,7 | 24,8 |
| 1993 | 16,5 | 11,4 | 24,3 |
| 1994 | 15,9 | 11,1 | 23,9 |
| 1995 | 15,3 | 10,8 | 23,5 |
| 1996 | 14,7 | 10,8 | 23,1 |
| 1997 | 14,1 | 10,7 | 22,7 |
| 1998 | 13,5 | 10,5 | 22,3 |
| 1999 | 13,0 | 10,5 | 21,9 |
| 2000 | 12,6 | 10,6 | 21,5 |
| 2001 | 12,3 | 10,4 | 21,0 |
| 2002 | 12,0 | 10,3 | 20,6 |
| 2003 | 11,8 | 10,3 | 20,2 |
| 2004 | 11,6 | 10,5 | 19,8 |
| 2005 | 11,4 | 10,4 | 19,4 |
| 2006 | 11,3 | 10,6 | 19,0 |
| 2007 | 11,2 | 10,6 | 18,7 |
| 2008 | 11,1 | 10,9 | 18,4 |
| 2009 | 11,0 | 10,7 | 18,1 |
| 2010 | 10,9 | 10,7 | 17,7 |
| 2011 | 10,9 | 10,4 | 17,4 |
| **Prediction** | | | |
| 2014 | 8,2 | 9,4 | 14,2 |
| 2015 | 7,7 | 9,3 | 13,6 |

### 2.1 Factors for the Declining Birth Rate

There are many factors that determine the natural movement of the population. They can be classified in this way:

a) *Biological constraints*

Besides changes in woman's reproductive period, expressed through lower limits of menstruation obtaining and disappearance, it seems that today more present factor is sterility. Most causes for infertility come from the lifestyle and fast pace of life (stress, infections, cigarettes, alcohol and drug addiction, unhealthy diet, use of chemical substances for muscle mass and others) (Preventus, 2013).

b) *Economic conditions*

The consequences of the global economic and financial crisis, expressed through job insecurity and increased costs of living, lead to endangering the life existence of married couples, and thus limiting the number of children. Housing, employment and cash incomes are very important conditions for making a decision of having a child. Not having own house, rent living, livelihood with minimum social income or income from only one family member are common reasons for delaying marriage and having children, although there is a desire for it (Demerdjiev, 1998).

c) *Advanced technology*

The advance in technology and knowledge in all areas related to birth also contributes to the reduced number of births. Unlike traditional unreliable methods as counting the fertile days, abstinence and others, technical - technological development in medicine allows the application of far more reliable methods, such as contraceptive pills, condoms, surgical sterilization and various injections and implants (Hatcher, et. al, 1984).

d) *Social factors*

Living environment has great impact on the decision about marriage and child. Life values, experiences and advices of the closer and extended family, the behavior within the family and the relationships between all family members is very likely to affect the reproductive behavior of the potential parents (Ekerman, 1966). In this regard, families today are often composed by husband, wife and one, perhaps two children, and their mutual relations are characterized with frequent conflicts, misunderstandings, divorces.

The state's role is particularly important in terms of financial support and legislation in this area. A common practice in employment policy is advantage to have those women who already have children and also job insecurity if the woman get pregnant. That's why young, but still not married girls postpone the marriage and women who had just got married postpone the childbearing until they get sufficient experience and build a career.

e) *Changed human psychology*

Today, the need for hedonism is increasingly expressed. Namely, because of the growth of the disposable income, stressful lifestyle and lack of time, young people have increased need for indulgence, small pleasures and better leisure time. In this respect, the man emerges as selfish and egoistic creature whose priority is personal pleasure, not sacrificing and giving pleasure to own child.

f) *Reduced number of marriages and increased number of divorces*

Nowadays, there is an increasing number of persons who have never married, people who get marry at older age and single parent families. Many factors are affecting this trend, including:

- Increased participation of women in the labor market

Today, women's level of education, intelligence and productivity is equal to that of the men and this allows same jobs, earnings and absence of sex discrimination in employment, on the one hand, but also reduces the interest for marriage, on the other hand.

- Lower relative income of men

Today, increased employment of the women compared to the past means more equal incomes of husband and wife. With other words, the relative earnings of the wife are increasing and the relative earnings of the husband are reducing. To feel superior and powerful, men first want to provide a reliable source of income before get marry. While accomplish this, they postpone the marriage. Also, this is often factor for divorce.

- Reduced benefits of family formation

Unlike earlier, when most important roles for the woman were housewife, mother and wife, today, among all this stands out the role of career woman. This change in priorities indirectly has influence on reduced number of marriages. In choosing partner, woman sets higher criteria in terms of education, intelligence and financial condition i.e. she wants the potential husband to be appropriate to her status (Paserman, 2003). The search for appropriate partner leads to delaying the marriage or not marring.

- Increased number of same sex couples and marriages

Besides marriage between man and woman, the marriage between persons from the same sex is becoming more frequent in countries where this type of marriage is legally permitted. Although in Macedonia, Turkey and

most EU countries this is still not allowed, there are many same-sex couples who are living together or have relationship. This trend means reduced number of heterosexual marriages.

- Better access to contraception and abortion

Big impact on the reduced number of live births has the use of contraceptive pills and abortion. These factors are more intensive compared to the past.

## 3 Comparative Analysis of Life Expectancy in Macedonia, Turkey and the European Union

Life expectancy in Macedonia, Turkey and the EU countries is slowly increasing. This means demographic aging of the population in these countries as a result of the impact of several factors. The development tendency of this demographic variable is presented tabular and graphic.

In 1980, Turkey has the shortest life expectancy of 58.7 years, Macedonia with 68.7 years is after and EU with 72.9 years has the longest life expectancy. This difference in length of life expectancy, especially among Turkey, on one hand and Macedonia and the EU, on the other hand, is significantly minimized in 2011, when the length of life expectancy in Macedonia (74,9) and Turkey (74,5) is relatively the same. By contrast, the EU, with 80,2 years life expectancy, is still in a significantly better position. The percentage of change in this analyzed period is 9 % in Macedonia, 27 % in Turkey and 10 % in the EU. This means that Turkey has made the biggest progress in this area, but, together with Macedonia, are still far from the level of the EU countries.

| Year | Life expectancy in Macedonia | Life expectancy in EU | Life expectancy in Turkey |
|------|------------------------------|-----------------------|---------------------------|
| 1980 | 68,7 | 72,9 | 58,7 |
| 1981 | 68,8 | 73,2 | 59,3 |
| 1982 | 68,9 | 73,5 | 59,9 |
| 1983 | 69,2 | 73,5 | 60,6 |
| 1984 | 69,4 | 73,8 | 61,1 |
| 1985 | 69,8 | 73,9 | 61,7 |
| 1986 | 70,1 | 74,1 | 62,3 |
| 1987 | 70,4 | 74,4 | 62,8 |
| 1988 | 70,7 | 74,6 | 63,3 |
| 1989 | 70,9 | 74,7 | 63,8 |
| 1990 | 71,1 | 74,8 | 64,3 |
| 1991 | 71,3 | 74,9 | 64,8 |
| 1992 | 71,5 | 75,3 | 65,3 |
| 1993 | 71,7 | 75,4 | 65,8 |
| 1994 | 71,9 | 75,7 | 66,4 |
| 1995 | 72,1 | 75,8 | 67,0 |
| 1996 | 72,3 | 76,0 | 67,6 |
| 1997 | 72,5 | 76,3 | 68,2 |
| 1998 | 72,8 | 76,5 | 68,8 |
| 1999 | 73,0 | 76,7 | 69,4 |
| 2000 | 73,2 | 77,1 | 70,0 |
| 2001 | 73,5 | 77,4 | 70,6 |
| 2002 | 73,6 | 77,6 | 71,1 |
| 2003 | 73,8 | 77,7 | 71,6 |
| 2004 | 74,0 | 78,2 | 72,0 |
| 2005 | 74,1 | 78,3 | 72,4 |
| 2006 | 74,2 | 78,7 | 72,8 |
| 2007 | 74,3 | 78,9 | 73,2 |
| 2008 | 74,4 | 79,1 | 73,5 |
| 2009 | 74,6 | 79,3 | 73,9 |
| 2010 | 74,7 | 79,6 | 74,2 |
| 2011 | 74,9 | 80,2 | 74,5 |

*Table 2: Movement of life expectancy in Macedonia, Turkey and the EU in the period 1980-2011* **Source:** *World Bank, World Development Indicators*
***Figure 2:*** *Movement of life expectancy in Macedonia, Turkey and the EU in the period 1980-2011*

### 3.1 Factors for Increased Life Expectancy

The trend of constant increase of life expectancy is a result of many changes taking place in 21st century, such as: clean water for the most people, better public and personal hygiene, vaccination against the most addictive diseases, new medical treatments for various chronic diseases, better nutrition, especially during pregnancy and childhood, decreased mortality rate, more physical activity, rise of the cash-rich and time-poor segment, search for greater value, growth of ethical consumption, emphasis on health and healthy lifestyle, the desire for enjoying small pleasures and many more.

Because of the growing awareness of individuals about their ability and responsibility to influence their health, increasing numbers of evidence about relation between diseases and diet and the transition from state welfare to individual welfare, more attention is paid to the lifestyle management. The recognition that the diet has a significant contribution to health means that people today are more careful in choosing a product.

Today, the old population has significant differences compared to the past. They are healthier, more active, richer, they travel more, want to experiment with food and are open to new technology. This means that they are keeping their young spirit and life style.

## 4 Conclusion

From the conducted analysis, we can conclude that the situation with the birth rate in Macedonia, Turkey and the European Union is worrying. The continuing rate of its decline indicates the need for urgent measures at state level. These measures include greater financial support for young parents, changes in labor law towards better mother's protection, job for every mother, public propaganda about the positive effects of having a child and the negative effects of an abortion.

Despite falling birth rates, the continuing increase in life expectancy suggests further encourage and support of this trend through broader and more accessible health care, better living conditions and promotion of healthy lifestyle.

# The Role of OECD Corporate Governance Principles in the Integration of Commonwealth of Independent States Countries to the World Economy

Prof. Dr. Naim Ata Atabey (Selçuk University, Turkey)
Ph.D. Candidate Halenur Yılmaz (Selçuk University, Turkey)
Ph.D. Candidate Merve Öz (Selçuk University, Turkey)

## Abstract

The founding members of The Organization for Economic Co-operation and Development (OECD) consist of mostly the European countries. The organization which is regional in nature and more focused on Europe has global aims like contributing to developments of world trade and economic development of members and other countries in the process of economic development. Corporate Governance Principles published for the first time in 1999 by OECD that can be adapted by each country according to their circumstances, provide guidance to countries in order to achieve the objectives. Corporate Governance Principles mainly focus on the responsibility, fairness, transparency and accountability. Gaining their independence after the dissolution of Soviet Union, the countries established Commonwealth of Independent States. They began to build their economic structures and make their presence felt in the world economy. Some developments like establishment of capital market can be seen as the best example of that effect. For all countries including Eurasia, adapting to the new institutional arrangements for businesses has become more important to continue their existence. Moreover, such integration between the CIS and world countries will contribute positively to developments of economic and cultural relationships. In this respect, enterprises in CIS countries are expected to shape their organizational structure according to international rules and standards. In this paper, the emerging developments of CIS countries due to being member to OECD and their compliance with Corporate Governance Principles, their possible problems and Corporate Governance Principles which is seen as common ground between CIS and world countries are evaluated.

## 1 Introduction

Although the concept of Corporate Governance has been in some studies in the U.S and Japan since 19th century (Morck and Nakamura, 1999) it is seen that it has been widely used in 1980s (Shleifer and Vishny, 1994). In 1990s, this concept has been on the front burner of individual and institutional investors, shareholders, managers and anyone interested in financial market (Gürbüz and Ergincan, 2004).

According to Corporate Governance Committee of Organization for Economic Cooperation and Development (OECD), Corporate Governance is identified in the widest sense as a system in which companies are directed and controlled, and the concept includes a set of series of relationships among the company's management, board of management, shareholders and other interested parties (Gürbüz and Ergincan, 2004). Accordingly, in the framework of corporate governance concept, management problems that arise from separation of ownership and control must be emphasized.

Many studies conducted in the field of corporate governance around the world show that there cannot be single corporate governance model for each country. However, "equality" which refers to all activities of company, shareholders and stakeholders must be treated equally in order to prevent possible conflict of interest; "transparency" which is about -except for information accepted as trade secret and undisclosed to public-declaring to the public financial and non-financial information about the company within the timely, accurate, complete, intelligible, interpretable, low-cost and easily accessible manner; "accountability" which states the accountability obligation of board of members against to legal personality of company and also to shareholders and another concept "responsibility" refers to compliance of all activities of company's management on behalf of the joint-stock company to regulations, articles of incorporations and internal regulations and supervision of these. These concepts are considered as generally accepted principles of corporate governance (Dalğar and Pekin, 2011; SPK, 2005). These principles have been the basis reference for national management codes applied in many countries and for international evaluations done for the considered application.

Corporate Governance Principles developed by OECD, have a growing importance, since they form one of the 12 basic international standards in order to robust financial system proposed by Financial Stability Board (FSB) that is strengthened after the crisis owing to its role. Today they are fundamental reference points of international evaluations and applied national governance codes in nearly 100 countries (Şafak, 2012).

## 2  Objective and Historical Developments of OECD

After World War II, in 1948, Organization for European Economic Cooperation (OEEC) was established in order to carry out Marshall Plan that is prepared for supporting and restructuring Western European Economies, Canada and USA have participated to this organization in order to increase their success and lay out their efforts and workings globally. In 1960 in Paris an agreement for the creation of Organization for Economic Cooperation and Development was signed. As a matter of that agreement, it became effective on 30 September 1960 and OECD was officially founded.

According to 1st article of this agreement, the objectives of OECD has supported following policies:

- To achieve the highest sustainable economic growth and employment and a rising standard of living in Member countries, while maintaining financial stability, and thus to contribute to the development of the world economy;
- To contribute to sound economic expansion in Member as well as non-member countries in the process of economic development; and
- To contribute to the expansion of world trade on a multilateral, non-discriminatory basis in accordance with international obligations.

At the time of the publication of this paper, OECD had 34 members. While the 20 founding members of OECD are the US, Germany, Austria, Belgium, Denmark, France, Netherlands, UK, Ireland, Spain, Sweden, Switzerland, Italy, Iceland, Canada, Luxembourg, Norway, Portugal, Turkey and Greece, later on Australia, Czech Republic, Finland, South Korea, Israel, Japan, Hungary, Mexico, Poland, Slovakia, Chile and New Zealand have become members of this organization. After the collapse of Soviet Union, in the early years of 1990s, in order to accelerate the integration process to the West, Poland, Hungary, Czech Republic and Slovakia have been accepted as members to the organization. Estonia, Israel, Slovenia and Chile joined the organization in 2010 and the accession negotiations are underway with Russia. The European Union Commission also participates the meeting without the right to vote. Brazil, China, Indonesia, South Africa and India have been invited to join the workings of the organization and to accept the organization's principles and applications.

The objectives of OECD in order to solve global economic, social, and management problems and to take the advantages of the opportunities of that process and working together with these 34 countries having democratic structure and market economy are:

- Fighting poverty and gaining wealth in cooperation with economic growth, financial stability, trade, investment, technology, innovation, and entrepreneurship and development fields.
- Ensuring the balance between protecting environment and economic and social development.
- Creating job opportunities and managing effectively and efficiently in the context of social equality.
- Giving recommendations to governments and helping them about understanding new developments and problems and providing solutions to these (MFA, 2014).

## 3  OECD Corporate Governance Principles

Corporate Governance Principles prepared and published by OECD with the help of relevant international institutions and private sector in 1999 includes some guiding principles and a set of standards. Principles are non-binding and they work as a guide for governments and companies to reexamine their understanding of management and to implement the predetermined standards. Changing conditions require making some amendments mandatory. Developments in the fields of social, economic fields necessitated the renewal of corporate governance principles and in 2004 these principles were revised.

In 2013, in order to revise principles that become global and adopted by FSB, all members of FSB have been invited as having equal rights in decision making with the members of OECD. To revise these principles, governing body benefited from business sector, investors, national and international professional organizations, trade unions, civil society organizations and international standard setting organizations and negotiations of shareholders (OECD, 2014).

Corporate governance definition of OECD summarizes the focal point, objectives and content of principles. According to OECD, corporate governance includes the relationship between company's management, board of directors, shareholders and stakeholders. Corporate governance also reveals the company's goal and determines the tools to achieve these goals and ensures how the performance will be monitored. The presence of effective corporate governance helps providing needed confidence to function properly in the market economy, for the whole economy and for each company that has a function in it. As a result, it is estimated that capital cost is reduced and companies are run by using their resources more effectively, so that the growth is supported.

The organization when its origin, founders and current members are taken into consideration, seems as regional, focused on Europe, but with its mission and goals contribute to world economy, works together with the countries whose share on the world economy is rapidly increasing like Brazil, China, India, Indonesia, South

Africa and Russia concentrate on regional programs including Middle East, North Africa and Eurasia (Şafak, 2012).

## 4  CIS Countries in the Eurasian Region

While the Eurasia is a region, which covers continents of Europe and Asia, as of 2012 there are 93 independent countries in Eurasia. With the decision of dispersion of Soviet Union in 1991, the countries, Russia, Belarus and Ukraine within the Eurasia Project of OECD and then with the participation of other Soviet Countries, Commonwealth of Independent States (CIS) was established. CIS, which is more of a political organization in nature, did not handle economic cooperation well enough between the given countries (Pirimbayev and Ganiyev, 2010).

During the Soviet period because of interdependence between Union of Soviet Socialist Republics (USSR), the economic relations were very close between these countries but in 1991 with the decision of a sudden collapse of USSR, continuing these relations have become impossible because of political and economic (high inflation) reasons and in the first period of independence, the countries have experienced a rapid decline in the production rate. Although the economic relations between these countries have weakened significantly, due to geographical and historical reasons economic cooperation will provide benefit for all countries and it has become mandatory for these countries (Pirimbayev and Ganiyev, 2010).

In that respect, it was felt that an effective economic cooperation organization was vital, and in 2001 Eurasian Economic Community (EurAsEC), which covers the countries like Russia, Belarus, Kazakhstan, Kyrgyzstan and Tajikistan was established. In 2006, Uzbekistan joined the community, but in 2008 mostly for political reasons it was separated. Moldova, Ukraine and Armenia had an observer status in the community. On 18 November 2011, according to agreement signed by Belarus, Russia and Kazakhstan, it was claimed that EurAsEc would be converted to the Eurasian Union in 2015.

## 5  Corporate Governance Issues in CIS Countries

The concept of globalization stated as historical process refers to increasing unification of the entire world economies particularly in the areas of financial markets and trade. According to some approaches, the concept of globalization is expressed as a process of labor and information flow in international area (Dikkaya and Özyakışır, 2008).

Today globalization is an inevitable fact and the necessity of going beyond individual and regional aims for countries is another fact. Therefore, it is expected from CIS countries not to remain outside of these developments and they should tend to be directed to new order which is created all around the world and to adapt to internationally accepted rules and standards. However, when the current states, their characteristics and conditions are considered in detail, it is seen that adopting such adjustments will not be easy.

Regarding CIS countries' macroeconomic indicators, it can be said that they are almost among the least developed countries in the world economy and face similar main economic and financial problems. These core issues are (Bati, 2005; Şafak, 2012):

- Capital markets to which institutional investors have limited contribution, international investments are not enough and there is liquidity shortage.
- Inadequate and underdeveloped capital authorities, stock exchanges, settlement and custody services and other capital market institutions.
- Unfair treatment and weakness about the protection of shareholders' rights and legal regulations.
- The presences of few large companies and shareholders have the largest shares.
- Inadequate principles for the protection of minority rights and setting their rights aside.
- Unaudited accounting records, lack of financial information and mostly absence financial information.
- Existence of economic environment to which investors and shareholders cannot properly reach, inability to access to necessary information that is risky and prevailing uncertainty and non-transparency.

Campos and Kinoshita have found in their study which was conducted on 25 countries in East, Central Europe and the Former Soviet Union in between 1990-1998, Foreign Direct Investments has a positive impact on economic growth (Campos and Kinoshita, 2002).

In 2001 in the Black's study which was applied on 21 Russia's firms, even in the environment in which laws are underdeveloped, an effective corporate governance system in firms will affect these firms' market value in highly positive way (Black, 2001).

Also Sprenger (2002) analyzed Russia enterprises and stated that there is a positive relationship between well performed corporate governance principles and the development of firms' performance (Sprenger, 2002).

After the war with the efforts to build their national economies within the effect of economic crisis Eurasia economies created capital authorities, stock exchanges, settlement and custody services and other capital market

institutions with the help of international financial institutions. In some countries regulatory authorities and stock exchanges are also have been established. However, as defined these formations are not enough and also undeveloped. The contribution of institutional investors is very limited; lack of international investment and lack of liquidity in the markets shows underdevelopment (Şafak, 2012). Early in this process, to support and strengthening these formations will be possible with corporate governance principles.

The biggest problem which can be overcome with effective corporate governance in CIS economies is because of highly extreme existing lack of trust. An investor has decided to invest to a company or a country will need to trust. Thus, the issue in CIS economies having lack of trust is not about protecting investors, it is about taking the investors in these countries or companies (Bati, 2005).

With the concept of transparency except for trade secrets and undeclared information to the public, timely, accurate, complete, understandable, interpretable, low-cost and easily accessible financial and non financial information related to company will be declared to public. In line with the principles with laws, the investor will feel safe against wrongful acts and will increase the rate of investments given countries.

If only those main problems of CIS countries related to corporate governance are overcome, most probably they can provide largest contribution. In the environment of trust, which can be ensured by adapting these principles and implementing necessary legal regulations, investments will increase and integration to the world will be accelerated in every field and resources in the region will be used most efficiently (Bati, 2005).

## 6    Conclusion

Eliminating all the problems in CIS countries with the regulations by adapting OECD Corporate Governance Principles should not be expected in the short term, since the process of perceiving and adopting the regulations by society and business environment can be done in a long period with educational activities and applications. Of course, that process requires patience and persistence. However, efforts for implementing corporate governance principles will ensure better functioning markets and help creating a culture that provides a set of certain values in terms of ethical behavior (Bati, 2005).

As a result, granting attached importance to corporate governance principles by considering the characteristics of CIS countries:

- Better quality and reliable capital markets will be created.
- Shareholders' rights will be protected.
- Minorities will have shares by protecting their rights.
- Environment of trust will be ensured for investors.

With all of these developments both firms' performances will increase and foreign investment will increase in CIS countries, thus economic development of these countries will increase.

Therefore, OECD corporate governance principles will undertake a duty as a bridge between CIS countries and other countries. And there is no doubt that in the adaptation process to global economy these principles will be a common denominator for both parties, so much so that the denominator will not only increase trade volume and capital amount of CIS countries, but also will change the economic and the social life in those communities in a positive way.

# Cluster-based Innovation Policies: A Critical Approach

Asst. Prof. Dr. Ayşe Saime Döner (Beykent University, Turkey)

## Abstract

Following the shift to a knowledge-based economy, designing and implementing the right institutions relevant to knowledge production has become the main concern of national industrial policies. Regional clustering appears as a commonly adopted policy tool to promote innovation in developed countries as well as in developing countries. In this regard, this paper examines innovation process in detail and explores the instruments that cluster-based innovation policies must support for promoting innovation. Innovation process may require particular coordination mechanisms at cognitive, institutional and social levels. I first draw a conceptual framework to define the essential aspects that need to be favored by innovation policies. This framework is then used to propose instruments of cluster-based innovation policies. While the idea of regional innovation clusters is mainly based on the geographical dimension of successful innovative activities, the success of clusters depends essentially on coordination mechanisms among the actors involved in the innovation process. Putting forward mostly financial incentives for companies isn't enough for clusters to sustain innovation. These clusters may only continue to promote transient innovation activities and not become the focal of a "learning region", unless they get embedded into a more complex relational setup.

## 1 Introduction

Innovation is today largely recognized as the driving force behind productivity and competitiveness of firms and industries, and thus economic growth of regions and nations. Accordingly, policies promoting innovation have gained high popularity among policy makers. These policies, mostly based on the arguments developed by "regional innovation system" literature (Cooke 1992; Cooke et al. 1997; Asheim & Gertler 2005; Asheim 2007), involves different actors from different backgrounds, such as firms, universities, research labs and even regulatory bodies. Indeed, value-adding innovations require complementary assets which are hardly held by a single actor. Networking and collaboration between these actors as well as coordinating innovative activities are considered crucial elements as the latter entail more and more complexity, costs and risks. There is a widespread agreement in academic literature that geographical proximity facilitates building collaborative relationships and helps to reduce costs of innovative activities. Furthermore, some successful regional models, like Silicon Valley in USA or Sophia Antipolis in France, evidence the prolific relation between geographical proximity and innovation. In this regard, economic-policy makers in many countries have been introducing a regional dimension to their innovation policies (Fritsch & Stephan 2005).

There is a large body of literature which emphasizes the importance of regions in innovative activities. Studies developing concepts like "*milieu innovateur*" (Aydalot 1986; Camagni 1991), industrial districts (Becattini 1992; Brusco 1986), regional innovation systems (Cooke et al. 1997; Cooke 2001; Asheim & Gertler 2005; Asheim et al. 2007) and learning regions (Morgan 1997) put forward the role of geographical proximity in new knowledge generation process. These studies emphasize that knowledge spillovers, which are regarded as the key factor to foster innovative activities, are geographically identifiable, but certainly not granted by solely geographical proximity. Knowledge sharing actually requires cognitive, social and institutional commonalities facilitating communication between actors. Policy makers, observing success stories of territorial innovation models like Silicon Valley and Sophia Antipolis, have implemented innovation policies copying these best practices. However, there is no "one-size-fits-all" regional innovation policy model (Tödtling & Trippl 2005; Asheim et al. 2011). Each country or each region needs a strategy specifically tailored at its particular characteristics. Nevertheless, it is possible to identify some political instruments and tools that would encourage the formation of a sustainable innovation cluster (Benner 2009). These instruments and tools need formulating with respect to the requirements of innovation process. As studies analyzing innovation or more generally knowledge generation process point out, innovation is an interactive process (Lundvall 1988; Morgan 1997; Foray & Lundvall 1998; Breschi & Lissoni 2001; Foray 2004; Antonelli 2005; Lundvall 2009) and thus any policy attempting to promote innovation should not ignore the social dimension of these activities. Hence, cluster-based innovation policies must support both cognitive and social requirements of innovation process. Considering these requirements, this paper provides a critical approach to cluster-based innovation policies and attempts to describe necessary coordination mechanisms to be favored by these. We start by examining the innovation process and more generally the new knowledge generation and the knowledge spillover mechanism, which is at the heart of the localization argument. In this regard, innovation process is examined in order to define the required conditions to be satisfied by the relevant policies. Based on these requirements, examples of instruments and tools that cluster–based innovation policies must support or implement are defined.

## 2   Knowledge Generation Process

Today knowledge is viewed as the principal resource for firms' productivity, industries' competitiveness and nations' economic growth. The economies are more and more dependent on the production, distribution and use of knowledge. Output and employment grow in knowledge-intensive sectors like high-technology industries. Thus, investment expenditures related to high-technology goods and services, research and development activities, training of the labor force increase. Labor demand is also characterized by knowledge-based jobs. These trends, demonstrating the arrival of knowledge-based economy, cause also changes in economic theories and models. Knowledge is no longer treated as an exogenous variable, but directly incorporated into production functions. However, the very nature of knowledge, such as being abundant instead of scarce but asymmetrically distributed among economic actors, complicates the task of including it into standard economic production function. Hence, efforts for understanding the economic characteristics of knowledge, including the generation and use of knowledge in economic systems, lead to the emergence of a new discipline called the economics of knowledge (Foray & Lundvall 1998; Foray 2004; Antonelli 2005). This new discipline, which introduces knowledge as an economic good, analyzes and discusses institutions, technologies and social regulations that can promote efficient production and use of knowledge. It doesn't however offer a unified perspective, given that scholars don't come to an agreement about the appropriability level of knowledge, i.e. the ability of agents to capture the returns of their efforts once the knowledge is created. While knowledge is considered a public good in the Arrovian approach, Nelson and Winter (1982) regard it as a quasi-private good. Finally, knowledge is more and more viewed as a localized, collective and complex, path dependent activity (Antonelli 2005). Knowledge generation process and specifically, innovation process can also be defined with respect to these approaches.

Within the Arrovian frame, knowledge is viewed as a public good for the high levels of non-excludability and non-rivalry. In this context, there is no incentive for economic actors to invest in innovative activities, as these actors can't guarantee ownership of their innovation and its pecuniary benefits. Therefore, following a top-down view, scientific knowledge is mainly generated in universities and other public research centers, while corporations undertake the generation of technological knowledge, which is basically the result of the application of new scientific discoveries(Arrow 1962; Nelson 1959). This top-down approach of innovation process is challenged, when Nelson and Winter (1982) argue that knowledge must be regarded as a quasi-private good with high levels of natural excludability. In this perspective, knowledge originates in a tacit form and is acquired by means of learning processes. Tacit knowledge, unlike codified knowledge, is hard to be shared and remains "sticky" to the locus of generation (Von Hippel 1994; Polanyi 1958), which ensures a high level of appropriability. Only once it is articulated and codified, it can be shared with "outsiders". In this approach, knowledge generation and diffusion follow a bottom-up process. Scientific knowledge thus come after technological knowledge which is mostly created in firms. Hence, the latter is considered as the locus where technological and organizational knowledge emerges via integration of learning processes and formal research and development activities.

With the re-discovery of external knowledge as an important input in the knowledge generation process, the third approach comes to appear in the 1990s (Lundvall 1988; Cooke 1992; Lundvall & Johnson 1994; Asheim 1996). According to this approach, new knowledge is created by combining complementary bits of knowledge held usually by heterogeneous agents. Knowledge generation process thus requires intentional and continual efforts of these interacting agents who, at least, belong to a community of practice and understanding. This new understanding of knowledge as a collective activity highly relates to the role of geographical proximity in the circulation of knowledge (Feldman 1994; Audretsch & Feldman 1996). Nevertheless, being closely located isn't enough to easily exchange knowledge. Absorptive capacity of agents (Cohen & Levinthal 1990; Tsai 2001; Nooteboom et al. 2007), institutional proximity (Torré & Gilly 1999; Boschma 2005) and social proximity (Granovetter 1985, 2005) are important factors that facilitate the exchange of knowledge. These factors also prove to be crucial regarding the knowledge spillovers, which are argued to play a key role in innovative capabilities of localized agents. However, cognitive proximity is rather avoided, since the variety in knowledge bases of these actors proves to be crucial in innovation (Frenken et al. 2007; Boschma & Iammarino 2009; Asheim et al. 2011). Too much cognitive proximity may indeed hinder the innovative process, since it doesn't offer something new to neither parties (Nooteboom 2000; Nooteboom et al. 2007). Furthermore, the efficiency of generation and dissemination of new knowledge is strongly affected by the network architecture of the interacting agents. Antonelli (2005) argues that while geodesic networks, where each agent is directly linked to each other agent, hamper the dissemination of new knowledge because of high communication costs, centered networks, which are based upon interconnected hubs, facilitate the knowledge flows between agents.

It is today largely acknowledged that innovation process is a collective and complex activity and that geographical proximity plays a key role in this process. Cluster-based innovation policies are thus developed and implemented taking into account this approach. By the means of these policies, policymakers are also hoping to take advantage of knowledge spillovers which are believed to increase the efficiency of innovation activities. Knowledge spillovers are defined as an externality, by which one or a few agents investing in knowledge

activities, like research or technology development, will end up facilitating other agents' innovation efforts. As several empirical works evidence, it is largely recognized that knowledge flows more easily among agents located within the same area and thus, knowledge spillovers are actually locally bounded (Jaffe 1989; Acs et al. 1992; Jaffe et al. 1993; Acs et al. 1994; Feldman & Florida 1994; Audretsch & Feldman 1996; Feldman 1999). However, as Breschi and Lissoni (2001) point out, for knowledge spillovers to exist, some specific conditions other than spatial proximity have to be met. As mentioned earlier, knowledge generation process requires some special institutional, social and cognitive arrangements. The same rules go for the knowledge spillovers as well. Here, we strongly suggest that knowledge spillover is not an unintentional activity but requires intentional and deliberate efforts of both the "spilling" and the recipient. In this regard, we insist that knowledge spillovers occur, when people or firms not responsible for the original investment of the creation of the knowledge benefit from this knowledge (Almeida & Kogut 1999; Rondé & Hussler 2005). Thus, building clusters where firms, research institutes and other agents are closely located isn't enough to create knowledge spillovers. Only in the frame of an adapted institutional and organizational context, the geographical proximity implies cognitive interactions (Torré & Gilly 1999). Institutions are described as "rules of the game" that constrain and shape human interactions (North 1990). They can be informal –as in social control, norms, and codes of behavior – or formal –such as written rules, contracts etc. Shared institutions among a group of agents provide stable conditions for knowledge transfer and interactive learning between agents. Thus, a certain level of institutional proximity covering a common language, shared habits, a law system securing intellectual property rights etc. is necessary for knowledge spillover (Boschma 2005). Similarly, social proximity refers to trust-based relationships which are embedded in different levels of social networks (Granovetter 1985) and considerably facilitates knowledge spillovers. Finally and most importantly, an agent can only benefit from a knowledge spillover only if he/she is able to decode the spilled knowledge. This situation refers to the absorptive capacity which is described as the ability to evaluate, to access and to assimilate outside knowledge (Cohen & Levinthal 1990). Another way of looking at the absorptive capacity of agents is analyzing the cognitive proximity between them (Nooteboom 2000; Nooteboom et al. 2007). Empirical evidence suggest that inter-sectoral knowledge spillovers occur only when sectors in question are complementary in terms of competences (Frenken et al. 2007; Boschma & Iammarino 2009). However, too much cognitive proximity may hinder interactive learning and real innovations, since no one offers something new to each other (Nooteboom et al. 2007). In sum, innovation activities require a certain level of cognitive, institutional and social proximities. Cluster-based innovation policies must therefore take into account these requirements which are not directly covered by the spatial proximity.

## 3 Cluster-based Innovation Policies

Following the shift to the knowledge-based economies, governments need also to transform their policies especially those relating to science, technology, education and industry. Acknowledging the importance of national innovation systems and the need for infrastructures and incentives, policies today need to prioritize enhancing knowledge diffusion, upgrading human capital and promoting organizational change (Foray 2004). National innovation systems bring together heterogeneous agents from industry, university and other knowledge-generating institutions, whereas infrastructures and incentives encourage investments in research and training. Cluster-based innovation policies intend to tackle these priorities, particularly by providing the framework conditions for university-industry-government collaborations and by forwarding the diffusion of new technologies into various firms and sectors. While the cluster-based policies have gained high popularity during the past three decades, the cluster phenomenon has long been present in the economic system. Being closely located offers indeed many advantages which are described as "pecuniary externalities", which allows co-localized firms to access specialized inputs and labor at a lower price than rivals located elsewhere, on the one hand and "knowledge externalities", which we have previously analyzed in this paper (Krugman 1991). The earliest recognition of the role of innovation in a local context is made by Alfred Marshall during the late nineteenth and early twentieth centuries. His famous saying "the secrets of industry are in the air" indeed illustrates the localized knowledge spillovers. Nevertheless, spatial proximity isn't enough for knowledge to spill freely into the air, especially when knowledge as a collective activity is highly excludable to those outside of the network. In this paper, we are especially interested in clustering policies which are formulated to take advantage of the aforementioned externalities. In this regard, we discuss some measures at meso-level (firms- universities- research institutes) and at micro-level (individuals moving from one organization to another).

Cluster-based innovation policies should not be limited to the provision of pecuniary advantages, which seems to be the case in most of the developing countries (Benner 2013). If the main objective behind these policies is to promote innovation, then they have to prepare the environment for knowledge externalities. More concretely, cluster-based innovation policies should aim the cognitive, institutional and social coordination. The cognitive coordination refers to the arrangements made to favor the knowledge generation. As discussed earlier in this paper, the knowledge generation process is defined as a collective activity bringing together heterogeneous agents holding each complementary bits of knowledge. This definition actually offers an important political implication at meso-level: cluster management must first classify the knowledge bases of firms and research

institutes that apply to settle in cluster, and then accept only those agents which hold complementary bases. This approach refers to the idea of "related variety" which proves to be a significant variable for innovative efficiency (Asheim 2007; Frenken et al. 2007; Asheim et al. 2011). As for the institutional coordination, the best move is to build the cluster upon the existing institutional base. As Asheim et al. (2011) suggest, a regional policy should capitalize the region-specific assets and evolve on them, rather than select from a pool of policy recipes that were successful elsewhere. Regarding the innovation clusters, this suggestion implies gathering the agents that have a history of collaboration and thus share some specific institutions. Previous collaborations would also foster trust building between agents. In sum, innovation as a continuous interactive process can be supported by policies encouraging the emergence of a dynamic coordination at meso-level. The dynamic coordination relates to the creativity and adaptability of agents into different contexts during innovation process. More precisely, agents are able to change their roles and behaviors without disrupting the harmony of innovative activities they are undertaking. In this context, announcement of long-term programs of scientific and technological research, where public agencies are also involved, can encourage the alignment of research activities of firms and the emergence of complementarity (Antonelli 2005). These programs can also help employees of those agents to build social bonds that can foster reciprocal trust, which brings us to the instruments at micro-level.

Other than policy instruments at meso-level, cluster dynamism can be substantiated by the means of instruments involving individuals. Benner (2009), taking various studies on cluster theory, summarizes a number of mechanisms that can affect cluster dynamism in relation to innovative activities. These mechanisms especially point to the collective nature of knowledge generation process. More precisely they emphasize labor mobility among different institutions like universities, research institutes and firms within the clusters as well as individual relationships among members of these different institutions. The labor mobility can be observed in two types; first, involving only companies and, second, relating companies to research institutes or universities. The first category includes horizontal and vertical cooperation among companies or spin-off formations. Cooperations based on localized input-output relations can actually support interactive learning processes. Spin-off companies are also considered another source of knowledge spillovers insofar as they transfer recently created new knowledge to a new company. The second category of labor mobility is related to the links between academia and firms. It covers recruitment of qualified new staff among alumni of higher education, student work or internship in companies, cooperation between universities and companies. These different mechanisms involving labor mobility can indeed allow knowledge and experience transfer. Nevertheless, a rapid increase in productive innovation series is never granted once these mechanisms are put in place. As Breschi and Lissoni (2001) suggest, pure knowledge spillover can occur only when workers moving from one firm to another help in creating a common pool of knowledge in the new firm. Otherwise, labor mobility serves only the purpose of shifting the knowledge from one place to another, rather than spreading it. In order to create and take advantage of the knowledge spillover, the labor mobility must be supported by a set of common values and norms which allow the knowledge diffusion within companies. Other than workers moving from one firm to another or scientists entering into contractual arrangements with some existing firms or starting up their own firm, individual contacts between workers of different companies may be also indicated as a vehicle for knowledge spillover. Inasmuch as relationships between workers may be embedded in different social networks (Granovetter, 1985); knowledge transfers during innovative activities may also be conveyed through the contacts within these networks. In this regard, the cluster management can organize events outside of work environment, such as festivals, dinners, picnics etc., so that individuals employed in different organizations of the same cluster can forge different relationships with each other.

## 4 Conclusion

This paper discusses cluster-based innovation policies by focusing on the characteristics of innovation process. Innovation process is largely acknowledged as a collective and complex activity involving heterogeneous agents, and geographical proximity plays a key role in this process. Cluster-based innovation policies are thus developed and implemented considering this approach. By the means of these policies, policymakers are also hoping to take advantage of knowledge spillovers which are believed to increase the efficiency of innovation activities. Cluster policies may indeed act as an intermediary enabling knowledge spill over and diffuse across sectors. However, innovation activities require a certain level of cognitive, institutional and social proximities. Cluster-based innovation policies must therefore take into account these requirements which are not directly covered by the spatial proximity. With respect to the cognitive coordination, complementarity of knowledge bases held by the firms and other knowledge-generating organizations located in the cluster must be carefully surveyed by the cluster management. As for the institutional coordination, the best move is to build the cluster upon the existing institutional base. Finally, social coordination is closely related to the labor mobility policies. In sum, proposing only a workspace and financial incentives to high-tech companies is not enough to create a sustainable innovation cluster. The cluster must prepare the environment for its resident agents to build dynamic coordination mechanisms. It is only then the cluster can become the focal of a "learning region".

# Impact of the Distance between Settlements and Regional Center of Chelyabinsk Region on the Amount of Ground Rent

Prof. Dr. Viktor Barhatov (Chelyabinsk State University, Russia)

Assoc. Prof. Dr. Dmitri Pletnev (Chelyabinsk State University, Russia)

Ph.D. Candidate Alfia Sagitova (Chelyabinsk State University, Russia)

## Abstract

A goal of the present paper is to consider how a differentiation of cadastral values of land plots and different distances from major cities create preconditions for a larger volume of a rental income at a minimum remoteness from a major city. In order to test this hypothesis, a relationship between an increase in land tax rates while reducing the distance of land settlements of the Chelyabinsk Region from Chelyabinsk was evaluated. To verify this assumption, we have analysed some results of a state cadastral evaluation of land settlements of the Chelyabinsk Region. For our calculations, we used land settlements with the highest cost per square meter based on permitted uses. We analysed the cost for these types of permitted use of land. The study and analysis of the results of the state estimation of land settlements in the Chelyabinsk Region have showed that in most cases the hypothesis was confirmed. The closer the plot is to the regional centre, the higher is its cadastral value and, consequently, the amount of a land rent.

## 1 Introduction

Investment incomes are important when forming budgets of various levels where a rent, in its various manifestations, has a high specific weight in a total income. A rent arises in conditions of ownership of resources, as well as in case of their lack. Sizes of a land rent also depend on the nearness of land plots to large cities where there are production sales markets. A tax rate also can depend on this distance. There exist a number of difficulties while determining the size of a land rent, it is connected with a cadastral assessment of land plots which may be carried untimely or fail with respect to a number of sities. Thus, an investigation of distances from settlements to regional centres has an important theoretical, methodological and practical value. Some attention is also paid to this research in the present paper.

## 2 Problems of Rental Relations

There exists an opinion that «the earth available in the structure of a city yields a bigger income than fertile earth of the same kind, which is far from the city. Although both land sites require, perhaps, identical work, but a delivery to the market of a product from a more remote land site is naturally more expensive. And, consequently, « … the rest from which both a profit of a tenant, and a rent of a landowner are accrued respectively decrease. » (Smith, 1993).

The differentiation of the cadastral cost of land plots located at different distances from the large cities creates prerequisites for obtaining a bigger volume of investment incomes in the event of a minimum remoteness of the land plots from a large city. However, not only a distance is capable to have an impact on both the rents. An opinion of a famous canonical scientist states: «Any production is an appropriation by an individual of nature's objects within the bounds of a certain public form and by means of it. So, the main source of production is an ownership of benefits and resources. Thus, a rent is formed due to the possession of a limited resource» (K. Marx). «Without gaining an opportunity of disposing of land, a right of private property of the latter is not full» (Shmelyova, 1997). It is a right of property of certain benefits and resources that permits a respective owner to receive a special type of income in the form of a rent. (Sagitova, 2013). (Pletnev, Sagitova, 2014).

Also, problems of rental relations are being studied by modern scientists, in whose works some attempts aimed at developing a mechanism of economic disposal of land property are traced, which will promote strengthening incentives for rational use of land and achieving high efficiency of agricultural work (Buzdalov, 1996).

A rent proper does not exist, it is derived under the impact of tools to which belong:

- price;
- profit;
- salary.

The size of a land rent is defined with the help of a lease agreement in which a price of the use of a rent resource is prescribed.

The following rent-forming factors influence the size of a land rent:

- monopolistic position of a resource;
- demand for a resource;
- resource offer;

- ecology;
- seasonality;
- intensity of service;
- availability of infrastructure;
- proximity of sales markets;
- quality of a resource. (Sagitova, 2013)

## 3   A Calculation of an Influence between Population Centres on the Amount of a Land Rent

The efficiency of rent relations in the course of the formation of a land rent in many respects depends on a distance of sites from large cities and regional centres. One of practiced forms of deriving a land rent is a land tax (Barkhatov, 2007). A land rent going into the budget manifests itself in the form of a land tax which is a local tax. A calculation of a land tax depends on a differentiated rate of a tax, which cannot exceed 0.3% of a cadastral cost with regard to lands of agricultural use and production, housing stock, engineering infrastructure, private household plots and horticultural and livestock husbandry. Also, the rate of a tax cannot exceed 1.5% with respect to other lands.

In order to verify the hypothesis, an interrelation was estimated between an increase of a land tax rate and a reduction in the distance of population centres' lands in the Chelyabinsk Region from Chelyabinsk.

To this effect, the results of the state's cadastral assessment of population centres' lands in the Chelyabinsk Region have been analysed. Land plots of population centres with the highest cost for one square meter were used for calculations, proceeding from types of permitted use. With this end in view, the types of permitted use of land plots were analysed cost-wise.

As a result of the analysis, it became clear that land plots of the following types of permitted use have the highest cost per one square meter (in a descending order):

1) land plots intended for locating hotels;

2) land plots intended for locating houses with an average and small number of storeys;

3) land plots intended for locating objects of trade, public catering and domestic services;

4) land plots intended for locating office buildings of business and commercial application;

5) land plots intended for locating ports, water terminuses, railway stations, road terminuses, airports, airfields and air terminals;

6) land plots intended for locating garages and parkings;

7) land plots intended for locating production and office buildings, structures, industrial constructions, municipal services, material-and-technical and food supply, sales and intermediate goods;

8) land plots intended for locating power plants and facilities which service them;

9) land plots intended for developing mineral resources; locating railway tracks, highways, artificially created internal waterways, moorings, piers, railway and motorway precincts, waterways, pipelines, cable, radio relay and aerial lines of communication, lines of broadcast networks, overhead electric lines of structural elements and facilities, installations necessary for the operation, maintenance, construction, reconstruction, repair and development of surface and underground buildings, structures and facilities, means of transportation, power engineering and communication; locating surface structures and infrastructure of satellite communication, objects of space activity, military facilities;

10) land plots intended for locating low-storeyed houses, including individual housing estates.

In order to calculate the hypothesis, the structure of 10 large city districts was analysed, taking into account the least distance from Chelyabinsk. Trend analysis of the cadastral value of the properties held by studying its dynamics and in clusters section. Total three clusters were formed. Conditions related sites permitted uses different clusters was the approximate value of the properties match the dynamics on these cities. Charting in each cluster was determined average value of the properties value. The first cluster hit areas following permitted uses: land plots intended for the placement of trade, public catering and consumer services, land intended for placement of garages and parking lots, land plots, designed to accommodate power, serving their installations and facilities. The second cluster was formed such areas as : land, designed to accommodate the business office buildings and commercial , land ,designed to accommodate middle-rise and low-rise buildings and homes, land , designed to accommodate hotels , land , intended for placing ports , water , rail and road stations, airports , airfields , air terminals. And finally, in the third cluster were following sections permitted use: land, designed to accommodate low-rise residential development, including individual residential development, land intended to accommodate industrial and office buildings, constructions industry, public utilities, land held for development of mineral resources, organize railways, highways (see Figure 1).
***Figure 1.** Influence a distance from city districts to the regional centre on an average level of the cadastral cost of population centres' lands*

Distance from population centres of the Chelyabinsk Region to the City of Chelyabinsk influences the cadastral cost of these land plots, and, consequently, on the volume of a land rent as well, which is estimated by multiplying the cadastral cost of land plots and a land tax rate. Results presented in Table 1:

| Districts of the Chelyabinsk Region | Distance from Chelyabinsk, km | Average cadastral cost, cluster-wise, in rubles | | |
|---|---|---|---|---|
| Kopeisk | 18 | 1863.92 | 1938.98 | 449.545 |
| Korkino | 41 | 1617.62 | 1547.743 | 445.3575 |
| Argayash | 57 | 1054.44 | 537.1767 | 219.2675 |
| Chebarkul | 82 | 2160.18 | 1676.407 | 412.88 |
| Yuzhnouralsk | 90 | 2277.01 | 372.8433 | 602.1 |
| Kyshtym | 99 | 1846.20 | 1593.383 | 413.85 |
| Miass | 106 | 1285.33 | 1159.323 | 423.97 |
| Plast | 124 | 1465.25 | 791.1 | 303.905 |
| Troitsk | 136 | 2459.30 | 1603.07 | 1072.21 |
| Zlatoust | 145 | 3399.87 | 2199.3 | 553.117 |

***Table 1.** Data on the remoteness of cities from Chelyabinsk and an average cadastral cost of land plots, cluster-wise. **Source:** State Cadastral Assessment (2011)*

Thus, the analysis of the state assessment's results regarding land plots of the Chelyabinsk Region's population centres, as well as the analysis of the distance of population centres from the regional center confirm the constitution of the hypothesis. The hypothesis fails in the event of the Zlatoust City District, and in a number of cases in the event of the Troitsk City District. The high cost of land plots of these city districts is associated with the following: deficiency of land, existence of tourist routes, proximity to the border …

The least differentiation of a land tax rate in the Chelyabinsk Region is traced with respect to land plots of agricultural destination, a housing stock and a subsidiary farm where the tax rate in most cases makes 0.3% of the cadastral cost of land plots.

The greatest differentiation of a land tax rate is represented with regard to land plots occupied for garages, parkings, as well as for apartment houses.

At the moment, there exist a number of problems connected with a withdrawal of a land rent. First of all, it is connected with the following:

- existence of waste lands;
- existence of lands which are out of turnover;
- inadequate use of land;
- lack of a cadastral assessment of land plots.

A solution of the above problems is possible only in case of working out measures aimed at improving the quality of land plots, which require considerable capital investments and which will have an impact on the reduction of a rent level in a short-term period and bring incomes in the future. One of problems of land use is that of shadow economy since land relations create prerequisites for concealing incomes obtained from the possession and use of land, because of which there arises a need of toughening the supervision over rent operations. Also, there are a number of problems connected with an inefficiency of land use, after the Law «On Privatisation of State and Municipal Property», as of December 21, 2001 Vol. 178-FZ, came into effect. On the basis of this law, there appears a possibility of privatising land, except for the alienation of land plots on which real estate structures are located, among them property complexes.

## 4    Conclusions and Prospects of the Research

The privatisation of land plots creates conditions under which it is far more difficult for the state to trace the legitimacy of the use of land plots. In these conditions, an incorrect and inefficient inflow of a land tax into the budget may take shape, which is connected an inadequate use of land plots. Owners of land plots may have shadow incomes which are formed as a result of rent relations with rent pernors, in case of a concealment of these relations from tax authorities. And all this leads to a leakage of investment incomes with respect to a land rent.

Thus, the research of the influence of a distance from city districts to regional centers on the volume of a rent regarding a land tax is of great importance. The problems revealed during the research can be successfully solved and may positively affect the efficiency of rent relations in the field of land use.

In order to solve the revealed problems of an inefficiency of rent relations in the field of land use, the following measures may be recommended:

- toughening the supervision of appropriate use of land plots;
- carrying out a full cadastral assessment of all land plots without exception;
- carrying out the supervision over the use of privatised land plots;
- checking the tax base concerning the calculation of a land tax;
- supervising over rent transactions;
- making improvements of land plots by means of fertilizers and other similar measures.

# The Experience of Turkish Economy on Tax Smoothing

Asst. Prof. Dr. Cevat Bilgin (Çukurova University, Turkey)

Ph.D. Candidate Handan Kaynar Bilgin (Çukurova University, Turkey)

## Absract

Taxes lead a deadweight loss and this deadweight loss increases with the tax rate. The main objective of the government should be deciding the tax rate which minimizes the deadweight loss. The planned tax rate is constant or the expected tax rate is the same as the current tax rate. The 'random walk test' of the tax smoothing hypothesis comes out by the fact that changes in the tax rate should be unpredictable. In other words, tax smoothing hypothesis implies that a tax rate has random walk behavior, but this behavior is not sufficient condition for tax smoothing. In this paper, a direct test of tax smoothing is presented; if future tax rate is cointegrate with the current permanent government expenditure rate, the tax smoothing hypothesis holds. By using this test, it is possible to differentiate among 'strong tax smoothing', 'weak tax smoothing' and 'no-tax smoothing'. Application of this test to Turkey shows evidence in support of weak form of tax smoothing.

## 1 Introduction

The main points of tax smoothing are expressed in Barro (1979). According to this article, the marginal welfare cost of taxation is an increasing function of the tax rate. Therefore, the ideal tax program is to set a permanently fixed tax rate that will generate revenue over time. Besides, it was assumed that the time path of government's tax revenue is determined by exogenously given government expenditure and an initial amount of debt. Taxes lead a deadweight loss and this deadweight loss increases more than proportionately with the tax rate. Deciding the tax rate which minimizes the deadweight loss should be the main objective of the government. This optimization is constrained by the present value borrowing. So the planned tax rate is constant under certainty or the expected tax rate is the same as the current tax rate under uncertainty. The 'random walk test' of the tax smoothing hypothesis comes out by the fact that changes in the tax rate should be unpredictable as they reflect only the new information on the time path of government expenditure, output, and other variables.

There are at least two reasons to go beyond the random-walk tests of tax-smoothing models. Ghosh (1995) argues that it is often difficult to reject the null hypothesis of a random walk for many economic time series in finite samples. Thus such tests may have very low power. Besides, even if tax rates follow a random walk, this does not necessarily imply that governments smooth taxes. Tax smoothing is only one of many possible explanations for unpredictable tax-rate changes.

Specifically, the tax smoothing hypothesis implies that future expectations of changes in government expenditure determine whether it is optimal for a government to run either budget surpluses or deficits in the present period. According to the tax smoothing hypothesis, it can be optimal for a government to run budget surpluses as well as deficits as long as they are justified by future expectations of changes in government expenditure. The tax smoothing hypothesis implies that when a government expects a future increase in its expenditure, it increases the tax rate today and runs a budget surplus (smaller deficit). Conversely, when the government expects a future decrease in expenditure, it lowers the tax rate today and runs a budget deficit (smaller surplus). This behavior can be explained by the fact that the government wishes to smooth the tax rate over time in order to minimize the implied distortionary welfare costs of taxation. As a consequence, when the tax smoothing hypothesis is true, the expected tax rate is constant over time, or, in more formal terms, the tax rate follows a martingale (Adler, 2006 and Reitschuler, 2010).

According to the study of Davis and Fabling (2002), if assets accumulated under a tax smoothing policy earn an average return more than the government's cost of borrowing, then tax smoothing minimizes the excess burden compared to a balanced budget policy. Therefore, it is advisable to examine whether countries actually follow tax smoothing fiscal policies. The optimal tax rate based on the tax smoothing hypothesis is a constant (or a smoothly changing one) if policy makers are concerned about minimizing the distortionary effects of taxation. Jayawicrama and Abeysinghe (2013) point out that testing whether the tax rate follows a random walk does not necessarily support the tax smoothing hypothesis.

Sahasakul (1986) presented a direct test for the tax smoothing hypothesis. The test implies that tax rate is related to the permanent component of the government expenditure rate. He found evidence against the tax smoothing hypothesis by regressing the US current marginal tax rate on the permanent and transitory components of the government expenditure rate and some other variables. It is difficult to measure permanent expenditure and income. Therefore, some researchers have preferred the other aspects of the tax smoothing hypothesis. They analyze whether the fiscal deficit is informative about future changes in government expenditures (Huang and Lin, 1993; Ghosh, 1995; Olekalns, 1997; Serletis and Schorn, 1999; Cashin et al., 2002; Niepelt, 2002). Huang and Lin (1993) find that the tax smoothing hypothesis (TSH) is rejected for the United States for the period 1947–1988 but not for 1929–1988. Ghosh (1995) finds that the TSH cannot be

rejected for Canada and the United States for 1962–1988 and 1961–1988. Olekalns (1997) rejects the TSH when applied to Australian data for the period 1964/1965 to 1994/1995. Olekalns and Crosby (1998) test the TSH for Australia, the United Kingdom and the United States; they find that tax smoothing cannot be rejected only for the latter. Cashin et al. (1998, 1999) test the TSH for India, Pakistan and Sri Lanka, respectively; they find that the TSH is rejected only in the case of Sri Lanka. The others impose unit root and cointegration by using government revenue and expenditure series to test the tax smoothing hypothesis (Strazicich, 2002; Adler, 2006; Lusinyan and Thronton, 2009, 2011; Reitschuler, 2010; Pasten and Cover, 2011). Adler (2006), which tests the TSH for Sweden, finding that tax smoothing is rejected for the period 1970–1996 but not for 1952–1999. These studies do not give a direct test of the tax smoothing hypothesis like in Sahasakul.

In this paper, we refer to the study of Jayawicrama and Abeysinghe (2013) for the testing TSH. As a model, we regress the tax rate on the permanent component of the government expenditure rate. By using this regression, we derive a direct testing of the tax smoothing hypothesis. If the tax rate and permanent component of the government expenditure rate are perfectly correlated, they have the cointegrating relation.

## 2   The Model

Government expenditure rate is defined as the ratio of total government expenditure to income. The extracted unit root component from this rate is called permanent government expenditure rate. Average government revenue rate as a proxy of marginal tax rate is characterized as the ratio of tax revenue to income; and we call it simply as the tax rate. We then set the tax rate equal to the permanent government expenditure rate as in Jayawicrama and Abeysinghe (2013).

$$\tau_t = g_t^p \tag{1}$$

where $\tau_t$ and $g_t^p$ refer to the tax rate and the permanent government expenditure rate respectively. The martingale property of the tax rate implies

$$\tau_{t+1} = \tau_t + \varepsilon_{t+1} \tag{2}$$

Thus we have,

$$\tau_{t+1} = g_t^p + u_{t+1} \tag{3}$$

where $u_{t+1}$ absorbs the transitory components.

The equation (3) can be written in testable form as

$$\tau_t = \beta g_{t-1}^p + u_t \tag{4}$$

where β is expected to be unity, $u_t = \rho u_{t-1} + \varepsilon_t$ and $\varepsilon_t$ is assumed to be zero mean white nosie process.

The autocorrelation parameter ρ measures the degree of cointegration. (Rajaguru and Abeysinghe, 2008). If the tax smoothing hypothesis holds, Equation (4) yields a case where two random walks cointegrate. The equation (4) includes transitory components. The three cases can be defined: (i) If ρ = 0, it is the highest degree of cointegration that implies the strong tax smoothing. (ii) If 0 < ρ < 1, it is the low degree of cointegration implying the weak tax smoothing. (iii) If ρ = 1, there is no cointegration that implies the rejecting the tax smoothing hypothesis even if the tax rate follows a random walk.

The Error Correction Model (ECM) developed by Jayawicrama and Abeysinghe (2013) to assess the presence of tax smoothing is

$$\Delta\tau_t = \theta_0 + \theta' x_{t-1} + \lambda_1 g_{t-1}^t + \lambda_2 g_{t-2}^p + \alpha_1\left(\tau_{t-1} - g_{t-2}^p\right) + \varepsilon_t \tag{5}$$

Where $g_{t-1}^t$ is the one lagged of transitory component, $x_{t-1}$ is a vector of exogenous variables imposing transitory effects on the future tax rates. The tax smoothing hypothesis holds if $\theta_0 = \theta' = \lambda_1 = \lambda_2 = 0$ and $\alpha_1 \neq 0$. If $\alpha_1 = -1$, then we have the strong version of tax smoothing. If $0 \prec \alpha_1 \prec 1$, then we have the weak tax smoothing. If $\alpha_1 = 0$, then the tax smoothing hypothesis does not hold.

## 3   Empirical Results

We use the annual data for the period of 1950-2012 to analyze the tax smoothing experience on Turkey. The tax rate is derived by the ratio of tax revenue to income and it is denoted by $\tau_t$. The expenditure rate is the ratio

of total government expenditure to income and it is denoted as $g_t$. Figure 1 shows the tax rate and government expenditure rate over the sample period. The tax rate and the government expenditure rate seem to have stochastic trend. This implies that both of the series have unit roots. Moreover, it looks like that there is a long run relation between them.

*Figure 1. Actual Tax Rate and Government Expenditure Rate*

Permanent component of the government expenditure rate, $g_t^p$, is extracted from $g_t$ by using two methods. The first one is known as the Beveridge-Nelson (BN) decomposition method presented by Beveridge and Nelson (1981). Firstly, we estimate the Autoregressive Integrated Moving Average model, ARIMA (p, d, q). We derived the appropriate ARIMA (2, 1, 2) model for the expenditure rate. Then, we decomposed the series as the unit root component and the transitory component by using the BN method in Eviews. The components are denoted by $BNg_t^p$ and $BNg_t^t$ respectively. The second method of deriving the permanent expenditure rate is Kalman Filter smoothing method. The smooth component is taken as the permanent component. (Hamilton, 1994) We derived the smoothed series of the expenditure rate by using the Gretl package program and denoted it as $KFg_t^p$. The difference between the actual series and the smooth series is defined as the transitory component, $KFg_t^t$.

| Variables | Level [a] | First Difference [b] |
|---|---|---|
| *Actual data* | | |
| Tax rate ($\tau_t$) | -0.995 (1) | -5.119 (1) ** |
| Expenditure rate ($g_t$) | -0.611 (1) | -4.553 (1) ** |
| *Decomposed transitory data* | | |
| BN $g_t^t$ | -15.11 (1) ** | |
| KF $g_t^t$ | -8.934 (1) ** | |

**Notes:** The values in parentheses are the appropriate lag numbers determined by Schwarz criteria, [a] tests include constant, [b] tests do not include constant, * denotes significance at the 5% level, ** denotes significance at the 1% level.

***Table 1****. ADF Unit Root Test Results*

Table 1 gives the Augmented Dickey Fuller unit root test results. The tax rate and the expenditure rate have unit roots in levels; they are nonstationary variables. Table 1 implies that the tax rate and the expenditure rate have the property of the random walk with drift. The first differences of the series are stationary, that is the variables are I(1) series. On the other hand, both of the transitory variables are stationary in levels; they are I(0) variables. Figure 2 plots $g_t$, BN unit root and KF smooth component. It is clear that there is close correspondence between the actual and permanent components.
*Figure 2*. *Actual, BN Unit Root and KF Smooth Series of Expenditure Rate*

Table 2 demonstrates the Least Square estimation results of the equation 4. We estimated two different equations for each definition of the permanent expenditure rate. The estimates of $\beta$ are very similar but they are less than unity; it is 0.676 for the BN model and it is 0.679 for the KF model. The correspondent t-statistics are implying that these estimates are statistically significant.

| **Beveridge-Nelson unit root series** | |
|---|---|
| Coefficient estimate of BNgpt-1 | 0.676 (55.07) |
| ADF test statistic for residuals | -3.958* |
| Rho ($\rho$) | 0.559 |
| AR(2) F test | 13.057** |
| **Kalman Filtered smooth series** | |
| Coefficient estimate of BNgpt-1 | 0.679 (59.42) |
| ADF test statistic for residuals | -3.819* |
| Rho ($\rho$) | 0.589 |
| AR(2) F test | 17.465** |

**Notes:** The values in parentheses are t values. ADF regressions have zero lag and no constant. The Engle-Granger critical value is -3.4 at the 5% level. * denotes significance at the 5% level and ** denotes significance at the 1% level

*Table 2*. *Test for Cointegration between Tax Rate and Permanent Expenditure Rate (Dependent variable is $\tau_t$)*

Table 2 shows that the degree of cointegration measured by $\rho$ is not perfect; they are between zero and one. The values of $\rho$ for each model are very similar; it is 0.559 for the BN model and it is 0.589 for the KF model. The unit root tests for the residuals prove that they do not have the unit roots at the 5% level of significance. This result supports the cointegration for both of the models. The autocorrelation test results imply that the residuals have autocorrelation problem. The autocorrelation problem in the KF model is bigger than the autocorrelation in the BN model.

Money growth rate (gm1) and unemployment rate (ur) are taken as exogenous variables and they reflect the transitory effects on the tax rate. According to the study of Jayawicrama and Abeysinghe (2013), the money growth rate has the seignorage and the inflation effect. Higher inflation and higher nominal incomes push individuals into higher tax brackets. Thus, the growth rate of M1 is expected to have positive effect. The effect of unemployment is related to the social welfare structure. If the social welfare structure is widespread, then the government might have to raise the tax rate to afford the relating services when unemployment increases. On the other hand, even if the social welfare is not extensive, the government may lower the tax rate to enhance economic growth when unemployment increases.

Table 3 gives the estimation results of the ECM defined by the equation 5. We estimated two different models; the first one includes the Beveridge-Nelson decomposed series and the second one includes the series derived from the Kalman-Filter smoothing method. These models are labeled as the BN model and the KF model. The diagnostic tests show that there are neither autocorrelation-heteroskedasticity problems nor specification bias in the estimated models. The estimated $\alpha_1$ values of the BN model and the KF model are -0.225 and -0.197 respectively. The former one is statistically significant at the 1% level; the latter is statistically significant at the

5% level. This result confirms the presence of the cointegration between $\tau_t$ and $g_{t-1}^p$. The degree of cointegration is lower than required value by the strong version of the tax smoothing hypothesis which is assuming $\alpha_1$ is -1. The estimated coefficients of the money growth have the expected signs but they are insignificant. The negative coefficients of the unemployment rates implies that the tax rates are decreased during the recessionary periods. However, their values are very small and they are not significant. Moreover, the effects of transitory components of the government expenditure rate on the tax rate are not significant in neither of the models.

| BN Model | | KF Model | |
|---|---|---|---|
| Explanatory Variable | Estimated Values | Explanatory Variable | Estimated Values |
| Constant | 0.221 (0.69) | Constant | 0.223 (0.79) |
| $BNg^t_{t-1}$ | 0.054 (0.25) | $KFg^t_{t-1}$ | -0.965 (-1.60) |
| $gm1_{t-1}$ | 0.007 (1.67) | $gm1_{t-1}$ | 0.007 (1.76) |
| $ur_{t-1}$ | -0.038 (-0.54) | $ur_{t-1}$ | -0.042 (-0.67) |
| $BNg^p_{t-2}$ | -0.073 (-1.75) | $KFg^p_{t-2}$ | -0.062 (-1.53) |
| $(\tau_{t-1} - BNg^p_{t-2})$ | -0.225** (-2.96) | $(\tau_{t-1} - KFg^p_{t-2})$ | -0.197* (-2.57) |
| Diagnostic Tests | | Diagnostic Tests | |
| $R^2$ | 0.463 | $R^2$ | 0.470 |
| AR(2) F test | 2.195 [0.12] | AR(2) F test | 1.191 [0.31] |
| Heteros F test | 1.657 [0.15] | Heteros F test | 2.123 [0.07] |
| Reset F test | 1.977 [0.15) | Reset F test | 2.715 [0.08] |

**Notes:** The values in parentheses are t values; the values in brackets are diagnostic p-values. * denotes significance at the 5% level and ** denotes significance at the 1% level. Pulse dummy variable is used for 2010.

***Table 3**. ECM for Testing on Tax Smoothing (Dependent Variable is $\Delta\tau_t$)*

## 4   Conclusion

The general conclusion derived from the empirical analysis is that Turkey has followed a weak tax smoothing. Taxes are known the main source of government revenue. Besides, tax rates are not changed so often by governments. Thus, it can be said that departures of the effective tax rate from the permanent government expenditure are mostly temporary, and this is not violating the tax smoothing hypothesis.

Tax smoothing implies that budget imbalances can be optimal fiscal policy responses to anticipated future events. If a government expects an increase in expenditure, then it can minimize the distortionary effects of the funding the expenditure by imposing some associated tax increase; the optimal policy is a budget surplus or a smaller deficit in this case. If there is an expectation of decreases in expenditure, a budget deficit or a smaller surplus is the optimal policy. (Cashin, et.al, 1999) The empirical results in this paper support this optimal fiscal policy by confirming the presence of the tax smoothing for the period of 1950-2012. The model in this paper indicates that the tax rate is adjusted subsequently in response to the permanent shifts in the government expenditure rate. Thus, it can be said that the government is likely to design the fiscal policy to minimize and spread the welfare loss of taxation.

# A Critical Review of Private Pension System in Turkey Considering the German System

Asst. Prof. Dr. Kemal Yaman (Mersin University, Turkey)

## Abstract

Private pension system includes various measures met to continue existing living standards without any restrictions in old age, i.e. after the end of employment. High life expectancy, low birth rate, and institutional deficiencies in societies are major drivers for private pension. To understand seriousness of the topic mostly state pension claims are considered as being insufficient in old age. That's why, necessity of private pension products results. In the first part, theoretical approaches to the explanation of savings behavior of people are described. In the second part of the study, the situation concerning precautions taken in Turkey is examined. In the following part, the retirement arrangements in Germany are depicted for comparison. The financial situation of elderly people in both countries is analyzed. Financial sector is the key beneficiary of developments in both countries. Governmental regulations concerning retirement system play crucial role to achieve high level of prosperity in the national economy of many developed countries. It is also seen in the study that industrialized nations are characterized by considerable private pension funds. Finally; some conclusions are drawn from the analyses performed in the study. .

## 1 Introduction

Financial problems in the social security system reforms on restructuring in many countries and even in highly developed countries are unavoidable to pursue financial sustainability of the retirement system and to raise the economic activity in country. In many countries participation in private retirement system is voluntary except Chile, Switzerland, Mexico, and Hungary where contribution to private pension funds are mandatory (Gülsün and Hatunoğlu, 2012: 1). Large deficits in the pension system in Turkey has emerged an important policy option to reduce the load on the state budget caused by existing public pension system by implementing new strategies in private pension plans. In addition, reforms in the private pension system play significant role to prevent declining domestic savings in Turkey which present risk for macroeconomic stability. In the world, pension systems are based on the three pillars consisting of public, mandatory private, and voluntary private pension system. The first one is financed by public retirement system where private retirement system acts as supplementary. Publicly managed pension system based on a payroll tax which is the most common way for governments to support old people financially (TCMB, 2013: 3 and World Bank, 1994: 102).

According to report of World Bank, increasing life expectancy and falling fertility rates are main reasons for problems in pension system. As a result, retirement systems of such countries face challenge in financing its aging population by the decrease in the number of young people. That is to say, pensions of the elderly population are covered by premiums paid by working young people. Aging problem ends up in financing each retired old person by few working people. At last, in a situation such as this leads to financial crisis. Thus, a new model needs to be implemented against the danger of aging population (Alper, Emin, 2004: 3). Establishment of private pension system is necessary to provide additional financial support to the existing public social security system for pensioners during retirement period. So, additional income can be available to secure existing living standard, and long term systematic private savings will have positive effects on economic benefits to the society (Erdem, 2013).

Figure 1 provides conceptual basis for the model to be developed for retirement behavior. Starting point of the model is the assumption that the pension outlined in the sense of financial security for the retirement is a savings plan. To investigate the individual point of view of the retirement process, it is necessary to apply an integrative approach. That means, diverse knowledge of economical psychology should be considered. It is also necessary to define the considered decision situation clearly in whole decision-making process of retirement. Based on this information, the model depicted in figure 1 includes two basic components.

- Financial qualification and willingness to make arrangements for retirement. These pension plans should be based on the consumption and savings model of Georg Katona.
- The so-called psychological triad.

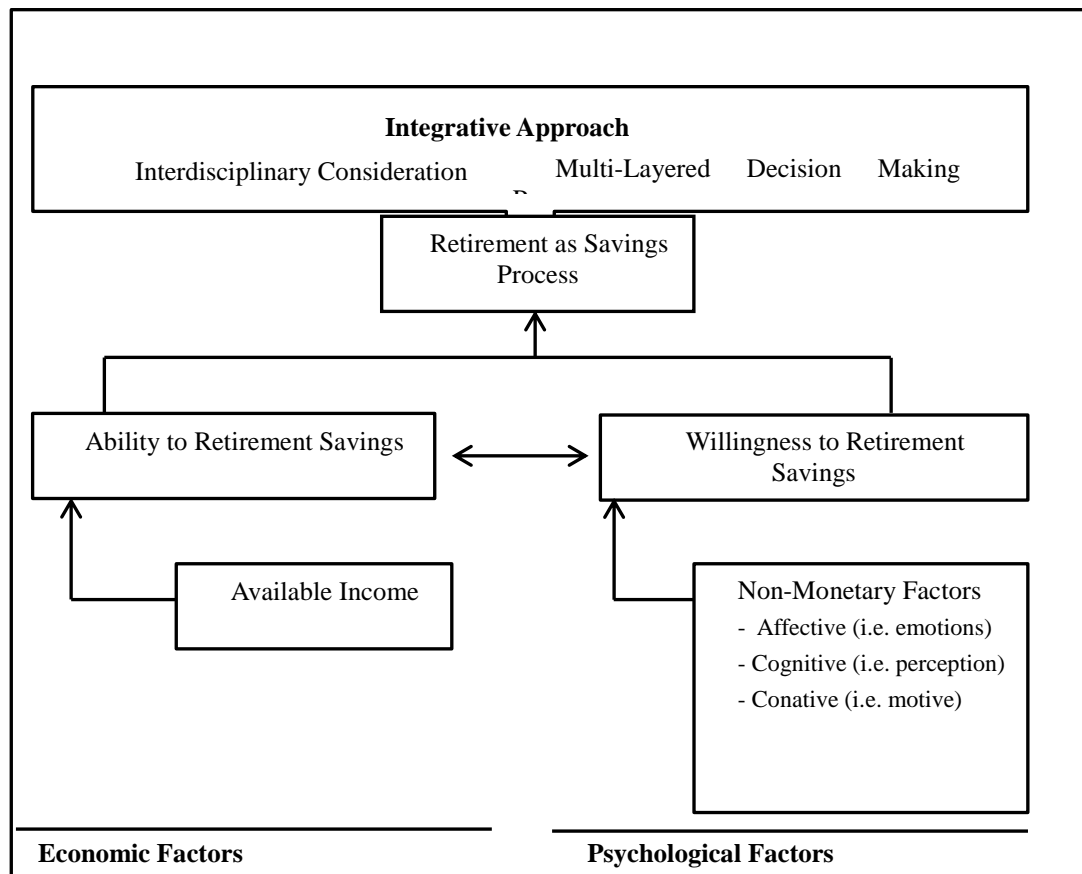
The retirement ability is affected by economic variables; that's why it is primarily determined according to the income situations. This group of factors is directly measurable. However, the willingness to pension plan depends on psychological influences. Under this should be all non-economic variables understood that may contribute to the explanation of retirement behavior (Salek, 2010).


**Figure 1:** *Model for Behavior of Retirement Savings (Salek, 2010: 53)*

Figure 2 shows theoretical system of factors influencing the willingness for pension plan which should be examined in this study. As outlined in this figure; economic, social, and psychological factors are fundamental.

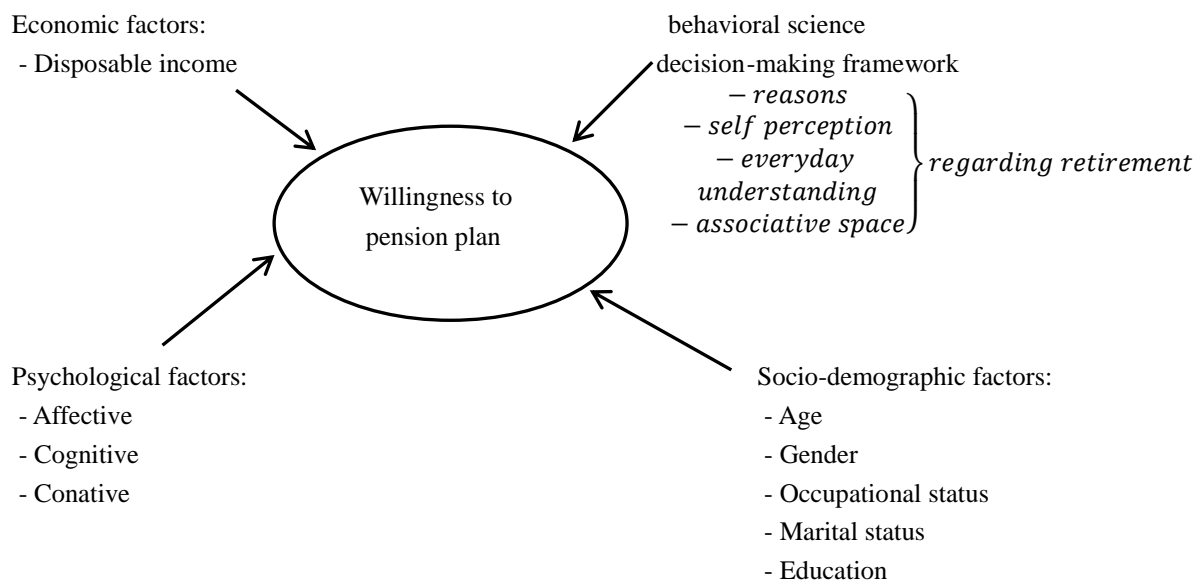

**Figure 2:** *Theoretical system of factors influencing the willingness for pension plan*

## 2 Theoretical Approaches to the Explanation of Saving Behavior

### 2.1 Life-Cycle Hypothesis

Employment and retirement phases are two important economic phases of a life cycle. The key assumption of the life cycle model is that individuals are forward-thinking and they also make and realize optimal consumption planning over their entire life cycle. To cushion intertemporal income fluctuations are main motives for

formation of savings. Other saving motives are precautionary savings, savings for purchase of durable consumer goods, and inheritance motives (Leinert, 2005: 15).

The neoclassical approaches experienced a renaissance with the life-cycle hypothesis of Modigliani and Brumberg as well as with the hypothesis of permanent income by Friedman. Distribution of income between present and future consumption is an active decision based on neoclassical approaches determined by assets and interest rate. Hypothesis of permanent income included in life cycle hypothesis reveals that people have an idea about the amount of long-term income as well as they want to maintain a certain and constant consumption level. Life cycle hypothesis highlights savings motive for retirement arrangement explicitly. Life cycle hypothesis supposes two strict assumptions comprising the rational behavior and perfection of the market. Aim is optimal distribution of consumption to remaining lifetime by given financial resources consisting of current income, assets, and expected income development. That means that working people in middle age save money in case of high earned income and finally consume accumulated capital stock in retirement. Young people also take loan if their financial situation is not enough to fund desired intentions but expected income development makes repayment possible. Since individual is rational, it is presumed that he/she can always estimate his/her lifetime earnings and he/she has an idea of the future income situation (Salek, 2010).

But, empirical evidence is against the predictions assumed in the life cycle model. So, these assumptions cannot be confirmed. Comprehensive findings deny lifelong planning horizon and show that level of consumption follows the level of income. That is to say, consumption responds to short-term income change (Leinert, 2005; Salek, 2010 and Thaler, 1990). Observed consumption and saving behavior of individuals deviate in all life stages for considerable part of households from central predictions of life cycle models (Salek, 2010: 36):

1. Young households often show positive saving ratios and low borrowings.

2. Many households estimate their future income incorrectly so that they take loans due to intensive consumption, and as a consequence they become insolvent.

3. In retirement people in Germany do not completely consume available assets including real estate. Majority of households of pensioners save money where, at first view, this behavior of old age people is theoretical explained by inheritance motives. But, empirical evidence shows that retired people with or without kids have no asset discrepancies. So, savings behavior of old people is not motivated by inheritance.

## 2.2 Behavioral Life-Cycle Hypothesis

From psychological perspective elements of behavioral effects are analyzed in the context of life-cycle hypothesis. People face problems in self-control, that's why they are hindered at realizing the intension of pension plan. Thaler and Shefrin considered three elements in their discussion of self-control: temptation, willpower, and internal conflict. Temptation is seen as a significant element to explain savings behavior of people. This element is understood as the ability to delay satisfaction to decrease the conflict between abrupt satisfaction and long-term benefits. It is also possible to state self-control as a behavioral cost (Huang, 2007 and Shefrin and Thaler, 1988). So, forgoing consumption is painful and uncomfortable. That's why; it requires effort and willpower to control themselves. Thus, control mechanisms such as mental accounts are used to limit propensity to consume (Salek, 2010). Each person recognizes income change different mentally. Small money entry is assigned to permanent income which is consumed promptly. But, unexpected money entrances are assigned to assets which are spent cautiously. This behavior of people can be characterized by higher savings tendency of asset account than income account (Winnet/Lewis, 1995 and Salek, 2010).

## 2.3 Pension Model of Leinert

Pension model of Leinert describes retirement savings behavior from psychological-behavioral aspect as shown in Figure 3. Central question in the approach of Leinert is under which conditions the intension for the pension plan and retirement savings should be realized. The deciding factor is a comparison of advantages and disadvantages associated in each phase. This process is similar to the economic cost-benefit analysis and that's why to what extent it is worth to perform actions such as planning and savings should be questioned. During retirement planning following costs; i.e., monetary planning costs for using a pension consulting, time usage as planning cost for consultation and information search, and at last psychological costs resulting from possible reluctance to financial matters arise (Salek, 2010).

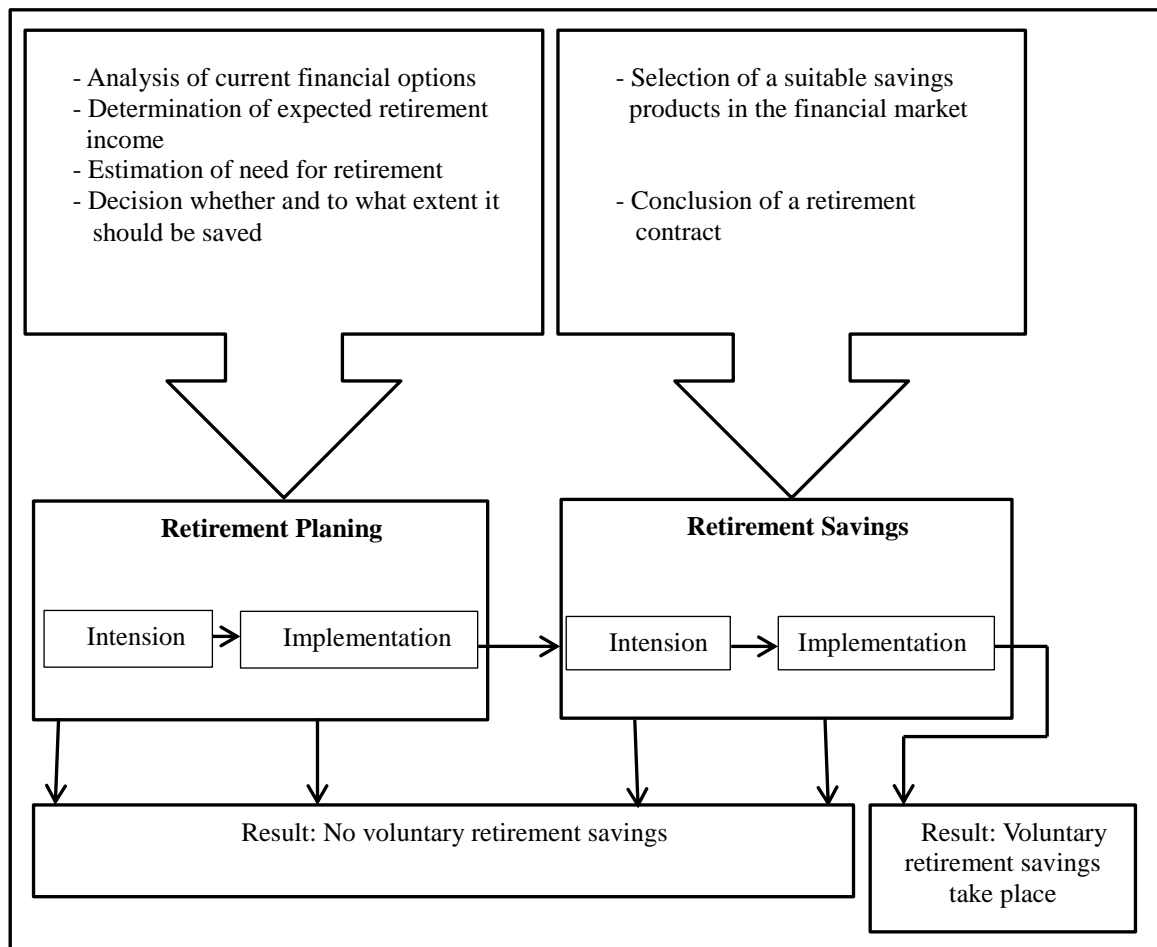
Retirement planing starts by engaging with the topic of retirement. Implementation is carried out in cognitive processes focusing on the financial resources and future needs from which necessary amount of savings contribution is determined. For the next step of retirement savings also exclusive intension is required. Application is done by choosing appriopriate pension product considering results of retirement planing. It is obvious that voluntary retirement procedure consists of four stages. Each stage is analytically separated and in each stage termination of retirement process is possible if the cost-benefit analysis is negative. Once all four stages are successfully completed, then increased retirement savings occur (Salek, 2010: 37 and Leinert, 2005).


*Figure 3: Retirement Process from Leinert (Salek, 2010: 38 and Leinert, 2005: 73)*

After introducing important theoretical approaches for the explanation of savings behavior of people, the situation concerning pension system in Turkey and Germany is analyzed.

## 3   Precautions Taken in Turkey Regarding Pension System

Private pension system in Turkey was regulated by the law no.4632 named 'Private Pension Savings and Investment System Law' introduced on October 7, 2001 as a supplement to the public social security system. Aim of this law was to direct individuals savings to investment for retirement to provide extra income for raising the level of prosperity. In addition, such a law targeted to offer long-term financial resources in order to increase employment and support economic development. Hereby, tax incentives were introduced to motivate people for participating in private pension system and at the same time in order to prevent leaving pension system entitlement to pension benefits are restricted and in some cases blocked. Considering problems in private pension system, a law came into force on January 1, 2013 to increase private savings. So far existing tax incentives in the form of deductions from taxes paid for received income has been replaced with this new law by introducing 25% state contribution. For Example, 100 TL pension premium is supported by state contribution of 25 TL (Emeklilik Gözetim Merkezi, 2008).

Regulations were implemented concerning taxation of income received in the private pension system. In order to encourage people to stay for a long time in the pension system, entitlement to the state contribution is gradually enabled. So; people have claim on state contribution and its gains in the 3rd year to 15%, in the 6th year to 35%, in the 10th year to 60%, and finally in retirement to 100%. It is clear that private pension system enables raising funds by preventing short-term speculative capital movement leading to financial crisis or at least to lessen the depth of the crisis. Worldwide private pension system provides financial resources to capital markets and it is expected that these funds will bring dynamism to the economy of the country in long term. Social security problems in Turkey are not demographic because of its young and dynamic population. Problems in this area are rather based on actuarial imbalance and institutional deficiencies leading to financial problems (Gülsün and Hatunoğlu, 2012).

Private pension system in Turkey does not have a long history, that's why it is also not so developed compared to other industrialized countries which can be seen from Figure 4. It can be clearly seen that developed countries with strong social security system such as Norway, Sweden, France, Luxembourg, and Germany show low private pension rate as a percentage of Gross Domestic Product (GDP). This may be explained by trust of inhabitants to their public security systems. But even in countries such as Finland and Switzerland with solid social security system, share of pension funds in GDP is remarkably where in Switzerland 114% and in Finland 79% of GDP is invested by people for hard times in retirement. Countries like Turkey made up just 4% of GDP in 2012 where a strong social security system is not available. Hereby, it is seen that Turkey a developing country has big potential to raise its pension funds due to its weak social security system.

**Importance of pension funds relative to GDP**

| Country | As a percentage of GDP |
|---|---|
| France | 0.3 |
| Luxembourg | 2 |
| Turkey | 4 |
| Germany | 6 |
| Norway | 8 |
| Sweden | 9 |
| Denmark | 50 |
| İsrael | 52 |
| United States | 75 |
| Finland | 79 |
| United Kingdom | 96 |
| Switzerland | 114 |
| Netherlands | 160 |
*Figure 4: Importance of Pension Funds Relative to the Size of the Economy in Selected OECD Countries in 2012*

Furthermore, the economic strength or purchasing power plays important role to achieve such a goal. For this reason, purchasing power in Turkey needs to be investigated. Gross Domestic Power was 792.6 billion US-Dollars in 2012 and because of 75,627,384 inhabitants in Turkey (TUİK, 2012) purchasing power per head was 10,481 US-Dollars. It should be noticed that regions in Turkey are inadequately developed. This corresponds to an amount of 7,944 Euros at the end of 2012 (TCMB, 2014). According to a report, about 30% of GDP was obtained in Istanbul (Doğan, 2013: 539). Considering this fact purchasing power per capita in İstanbul, Ankara, İzmir, and Antalya is higher than in relatively less developed cities in east and south eastern areas of Turkey. Consequently, demand for products of private pension in developed cities is higher. Economic power of inhabitants in Turkey is too weak compared to people in Germany. That's why retirement system in Turkey is not so developed as desired. In a development report of private pension system the number of completed private pension contracts in Turkey are depicted. These numbers clearly show disparity in purchasing power in Turkey. So, 45% of contracts are completed in the Marmara region (North-West Turkey, i.e. İstanbul), 15% in the Central Anatolia region (i.e. Ankara), 16% in the Aegean region (i.e. İzmir), 12% in the Mediterranean region (i.e. Antalya), 7% in the Black Sea region, 3% in the Southeastern region, and just 2% in the East region of Turkey (Emeklilik Gözetim Merkezi, 2012: 17). From the same report, it follows that 61.3% of completed contracts are made by men and 38.7% by women. Thus, economic power of women should not be underestimated (Emeklilik Gözetim Merkezi, 2012: 31).

In the next step development of private pension system is investigated. Hereby, it is clear that from 2004 until 2014 the number of contracts in Turkish private pension system has increased more than tenfold. These numbers show that people in Turkey are aware of poverty in old age. As soon as suitable circumstances are available for pension fund accumulation people actualize it. As can be seen above, in economically developed regions such Marmara region in which 45% of existing contracts are completed, people tend to purchase such products. Certainly, the role of Turkish State should not be underestimated by implementing new techniques to make pension system more and more attractive for its citizens. So far, existing tax incentives in the form of deductions from taxes paid for received income has been replaced with this new law by introducing 25% state contribution.

But, the main problem in Turkey is weak economic performance of people which can easily be recognized from per capita income. Thus, savings rate is low in Turkey. In regions where people hardly survive financially, naturally they are not able to put money aside for old age.

| 2004 | 2005 | 2006 | 2007 | 2008 | 2009 | 2010 | 2012 | 14.02.2014 |
|------|------|------|------|------|------|------|------|------------|
| 334,557 | 714,146 | 1,141,428 | 1,576,273 | 1,933,266 | 2,203,886 | 2,534,840 | 3,496,377 | 4,278,414 |

*Table 1: Development of number of contracts in pension system (Emeklilik Gözetim Merkezi, 2013)*

Examining number of contracts and total contributions in the period between 2004 and 2014, it becomes clear that number of contracts and total contributions in private pension system show the same tendency. In 2004 contributions made up just 157.4 million Euros where in 2014 it has reached 8.56 billion Euros. In the same time period contributions grow fifty-five times (see Table 1 and 2).

|                    | 2004 | 2005 | 2006 | 2007 | 2008 | 2009 | 2010 | 2012 | 14.02.2014 |
|--------------------|------|------|------|------|------|------|------|------|------------|
| TL (in million)    | 288.3 | 1,117.2 | 2,592.5 | 3,917.1 | 5,467.7 | 7,102 | 9,515.2 | 17,282 | 25,663.2 |
| Exchange rate      | 1,8321 | 1,5952 | 1,8604 | 1,7142 | 2,1435 | 2,153 | 2,065 | 2,3565 | 2,9974 |
| Euro(in million)   | 157.4 | 700.4 | 1,393.5 | 2,285.1 | 2,550.8 | 3,298.7 | 4,607.9 | 7,333.7 | 8,562 |

*Table 2: Development of contributions in pension system (Emeklilik Gözetim Merkezi, 2013 and TCMB, 2014)*

In order to identify the effect of pension system on a country's economy, examination of pension fund asset allocation for selected investment categories in selected OECD countries is required. Hereby, investment categories are shares, bills and bonds, cash and deposits, and others. In 2012, bonds (representing bills and bonds) and equities were the two most preferred asset classes for invested pension funds. In the USA 48.9%, in Australia 46%, in Finland 37.1%, in Germany about 5%, and in Turkey around 18% of total investments are allocated to stocks. The investment approach of German insurance companies show more reserved behavior against stocks, whereas Turkish companies are more open for investments in more risky instruments. Bills and bonds are fixed income securities with more guaranteed returns. That's why, in over half of the OECD countries more than 50% of pension funds are invested in bills and bonds. In 14 OECD countries; Turkey, Germany, Iceland, Israel, Luxembourg, Norway, Poland, the Slovak Republic, Slovenia, Spain, Sweden, Austria, Chile and Denmark; more than 50% of portfolio was invested in bills and bonds in 2012. Percentage of invested funds in bills and bonds make up more than three-quarter of total investments in Czech Republic with 85.4%, in Hungary 84.6%, and in Mexico 80.9%. Other investment tools constitute around 42% in Germany and around 18% in Turkey. Finally, proportion of cash and deposits in pension fund portfolios is not more than 5% in Turkey as well as in Germany. It is obvious that pension funds are invested in financial market products, so its contribution is of great importance for the economy of a country (OECD, 2013:19). Examination of Turkish households' savings rate indicate a declining trend of 17.7% to 7.3% from 2003 to 2010 (TCMB, 2013: 14).

## 4   Retirement Arrangements in Germany

Retirement system in Germany is based on the so-called three pillars: Statutory pension system, occupational pension system, and private pension system. Statutory pension system is based on the principle of distribution. That means, contributions paid are not saved but these are used for pension payments to current retirees. Thus, it has no claim for refunding of already paid contributions. Younger generation comes up for the pension of old generation. This is based on the principle of solidarity. Due to aging population in Germany and decreasing fertility rate, less working people will have to fund gradually increasing number of retired people. As a result of increasing life expectancy people living longer are financed by decreasing number of social security contributors. To close the pension gap emerging by the cuts in legal services, it is therefore necessary to build significant additional savings. There are indications that savings for retirement will show an increase. However, previous experiences in Germany show that majority of the population do insufficient individual retirement arrangement despite existing resources as well as in spite of widespread recognition of the necessity of individual responsibility (GDV, 2004).

As a consequence of this age pyramid, pension contributions of working people will increase more and more in the future. The lacks in social security system force state to implement new instruments to increase living standards in retirement. Second pillar, so-called occupational pension system (betriebliche Altersvorsorge), is possible for working people as soon as their employers grant their employees' pension commitment. Since January 1th, 2002 employees basically have the right to convert part of their wages in an equivalent pension commitment (Statistisches Bundesamt, 2014). In addition, company pension is supported by tax incentives to strengthen this type of retirement scheme. Every employee in Germany is legally entitled to occupational pension system. But, this does not mean that every employer has to pay pension as it is common for larger companies. Mostly a part of the annual salary such as monthly wage or holiday payment as well as Christmas bonuses, and special payments can be converted into company pension. As a general rule, employer transfers money directly from the gross salary so that taxable income decreases. Thus, employee enjoys tax privileges. As

a consequence, people have tax advantage from this application. By the end of 2004, completed contracts reached 2,640 Euros tax and social security contribution-free in principle. Starting from 2005, contracts have received tax benefits around 4450 Euros per annum. Payment of pension by company to employee is guaranteed.

Additional contributions for statutory pension and health insurance shrink. As a consequence, if the employee's income is subtracted 200 Euros for occupational pension by company employee's net income will be about 100 Euros less. That means, net salary decreases only by about half of transferred gross salary. Although occupational pension system offers several financial advantages compared to other forms of investment, only one in every three persons of German employee has occupational pension. Even though occupational pension is offered by employer to 60% of population in Germany, only 29% take advantage of it (Stern, 2013 and Süddeutsche Zeitung, 2011). If expressed in numbers, the number of active pension rights in occupational pension has increased from 14.6 Mio. in 2001 up to 19.6 Mio. in 2011(Bundesministerium für Arbeit und Soziales, 2012: 134). Statistics show that even young people are less interested in occupational pension where they should have been more arranged for their retirement because of decreasing services offered by German state to retired people. That's why young people should expect much less from the state concerning statutory pension (GDV, 2004: 77). Total premium income in 2011 for occupational pension reached 13.8 billion Euros. According a report of the auditing firm of PWC, occupational pension market in Germany is the largest and most attractive opportunity field (Versicherungsmagazin, 2012).

Another type for financing retirement is the private pension, the so called 'Riester-Rente' in German language. Beyond the measures to promote occupational pension, tax-subsidized and fully funded (i.e., backed by a fund of assets) pension scheme Riester-Rente was implemented in 2002. This provides a possibility to compensate the unavoidable pension cut of statutory pension insurance given the forecasted demographic development in Germany. Riester-Rente is designed as a voluntary additional pension scheme. By the end of June in 2012, the number of Riester contracts were around 15.6 Mio. However, it should be realized that the number of newly completed contracts were only 0.2 Mio in 2012. The reasons of this situation are mainly found in the financial market crisis leading to an increasing skepticism towards fully funded retirement system. Even though there is a big demand for Riester-Rente, total premiums (own contributions plus allowances) of the funded pension contracts in 2009 were around 8.1 billion Euros. (Bundesministerium für Arbeit und Soziales, 2012: 141-149).

In 2011, each German citizen paid nearly 2,000 Euros in average for his/her private insurance coverage. Half of this sum accounted for life insurance, i.e. private pension. For contracts of property and casualty insurance such as automobile insurance, private liability insurance, legal protection insurance, building and households contents insurance each German citizen spend on average 450 Euros per year. People in Germany pay 400 Euros in average per annum for private health insurance. However, this contribution may vary in case of statutory health care where the contribution is determined by a certain percentage of between 14% - 16% of received income. In 2011, premium income in life insurance pension reached 86.8 billion Euros (GDV, 2012: 4). In total 92.6 million contracts for the intention of pension were completed such as life insurances and pension funds (GDV, 2012: 24)

Table 3 presents the development of premiums received from life insurance including pension funds where an obvious increase is recognized from 2004 to 2010. In addition, private savings of households and the savings rate in percentage of disposable income as well are shown. It becomes clear that private savings grew up to 180.3 billion Euros in 2008. As a result of financial crisis in Germany, the savings rate of households decrease starting from 2008. That's why, private savings declined from 180.3 in 2008 to 172.6 in 2011.

| Year | Premiums received in Life Insurance incl. pension funds (billion Euros) | Private Savings (billion Euros) | Savings rate of Households (in %) |
| --- | --- | --- | --- |
| 2004 | 70.3 | 151.8 | 10.6 |
| 2005 | 75.2 | 156.9 | 10.7 |
| 2006 | 78.5 | 162.5 | 10.8 |
| 2007 | 79.0 | 168.1 | 11.0 |
| 2008 | 79.7 | 180.3 | 11.5 |
| 2009 | 85.2 | 170.1 | 10.9 |
| 2010 | 90.4 | 174.7 | 10.9 |
| 2011 | 86.8 | 172.6 | 10.4 |

***Table 3:*** *Contribution in Life insurance, Private Savings, and Savings Rate (GDV, 2012: 28)*

To compare per head income of the population in Turkey with people living in Germany the need for consideration of gross domestic product in 2012 results. The monetary value of all the finished goods and services produced in Germany reached 2,645 billion Euros (Statistisches Bundesamt, 2013: 2). At the end of 2012, the number of inhabitants was 80.5 million (Statistisches Bundesamt, 2012) so that per capita income was 32,857 Euros. People in Germany have four times more income than individuals in Turkey.

Analysis above show that people in Germany do much more for retirement but at the same time Germans still worry so much about their pension. This is due to bad news from financial markets as they know that big part of their pension funds are invested in financial market products. According a report of the German newspaper Süddeutsche Zeitung, this unstable situation in Germany is the consequence of implementation of rescue packages of troubled banks by the German government and the circumstances of the German stock market. In principle, bankruptcy of a life insurance company is possible but practically rather improbable. Moreover, badly managed corporations are usually taken over by other companies. If a company becomes insolvent bailout fund called Protektor helps out. All licensed insurance companies in Germany have to pay to the bailout fund. As a consequence, Protector takes over the payments of existing contracts in bad times and continues the management of these contracts such as the case of the Mannheimer life insurance company. In 2002, Mannheimer registered a loss of nearly 60 million Euros because of failed stock speculation. Only promised guaranteed interest rate was paid to the customer but no surpluses. Surpluses are paid to contract holders when the insurer invests the capital of customers in lucrative investment assets. Because of the financial crisis, insurance companies may face the problem of earning guaranteed interest rate which is promised to contract holder in life insurance contract. That is the reason why they reduced the proportion of the shares in investment products. At the same time, risk-free investment products such as government bonds are not very attractive due to the low-interest policy of central banks (Süddeutsche Zeitung, 2010).

## 5   Results

Social security system plays import role for people to maintain existing living standards. In general, statutory retirement system is not sufficient to achieve this goal. Theoretical basis demonstrate that intention alone is not sufficient to take appropriate measures for pension. Circumstances play major role in realizing their purpose such as available income, assets, expected income, governmental assistance, tax allowance, and psychological-behavioral perspective.

In comparison to the available system in Turkey, a well-developed statutory retirement system exists in Germany. As a result of aging population and increasing expectancy of life, more and more retired people have to be financed by decreasing number of working people because of falling fertility rate in Germany. So, German people tend to take additional measurements to continue their economic status. In addition to the existing statutory system, analysis of German private retirement market show that people put aside 1000 Euros for retirement per annum. Premiums received in life insurance made up for instance in 2010 more than 90 billion Euros and occupational pension system reached nearly 20 billion Euros in 2011. Riester-Rente is another type of private pension in which 8.1 billion Euros were received in 2009. Per head income highlights the economic situation of individuals' in both countries: German people earn four times more than individuals in Turkey. Economic power of Turks indicates their weak position regarding retirement. That's why; a weak private retirement market in Turkey exists. Governmental arrangements in Turkey such as introducing 25% state contributions are realized to improve the miserable situation in private pension market. The new regulation helps to increase pension contribution from 157.4 million Euros in 2004 up to 4.6 billion Euros in 2010. Increasing trend continues and it reaches 8.56 billion Euros on February 14th, 2014. Nearly 20 times more pension contributions were received in Germany than in Turkey in 2010. Germany shows better development concerning private pension system than Turkey. But in comparison to Netherland, Switzerland, and United Kingdom as a percentage of GDP, Germany indicates very low share with 6% of GDP where this rate reaches 160% in Netherlands. This paper shows a big potential of growth for Germany and for Turkey with 4% private pension fund of GDP. Turkish pension market indicates growing tendency, but the weak economic power in Turkey is the main reason for this phenomena. As soon as people have financial resources and incentives to savings are available, they have a tendency to invest in pension system for old age. Governmental regulations concerning retirement system play crucial role such as Riester-Rente and occupational pension system (betriebliche Altersvorsorge) in Germany as well as 25% state contribution in Turkey. To achieve high level of prosperity in national economy, measures taken by governments concerning retirement system are of great importance. It is also seen in the study that industrialized nations are characterized by considerable private pension funds.

Growing economy in Turkey may provide investment possibilities to German insurance companies in prosperous sectors such as energy, banking, and production of industrial goods due to its dynamic, young, and well-educated population in Turkey. As stated above, German insurance companies possess a big amount of capital and these companies are looking for lucrative investments. Lucrative sectors in Turkey can attract much more capital from German companies. Turkish markets need more investments in order to raise the economic power of their inhabitants and German companies need more profitable investment areas to meet their obligations to insurance contract holders regarding guaranteed interest as stated in contract.

# Extreme Coexceedances in South Eastern European Stock Markets with Focus on EU Accession Countries

Asst. Prof. Dr. Dragan Tevdovski (Ss. Cyril and Methodius University, Macedonia)

## Abstract

The aim of this paper is to investigate and document the financial contagion of the South Eastern Europe (SEE) stock markets. Using a modification of the Bae et al. (2003) coexceedance approach based on multinomial logistic regressions we model the occurrence of the large negative or positive stock returns on a given day across the SEE stock markets. Specifically, we divide the SEE stock markets on two groups based on country's EU membership in order to allow for transmission mechanism from major EU economies stock markets to EU member countries from SEE, and in addition, transitory effect from EU member countries from SEE to accession countries from SEE region. We test the persistence, asset class and volatility effects on the likelihood of the coexceedances in both SEE groups. We find that effects differ: (i) between negative and positive coexceedances and (ii) between the EU member countries and EU accession countries stock markets from SEE. The empirical evidence for the persistence effects, asset class and volatility effects in the SEE region should draw the attention of both investors and policy makers.

## 1   Introduction

The stock market comovements received a lot of attention in international finance since it has important practical implications for asset allocation and investment management. There is voluminous empirical literature that examines stock market comovements among developed countries (for example, Engle and Susmel (1993), Bekaert and Harvey (1995), Longin and Solnik (1995), Forbes and Rigobon (2002) and Johnson and Soenen (2003). Also, there is increasing body of literature concerning Central and Eastern Europe (CEE) stock market comovements (for example, Kasch-Haroutounian and Price (2001), Voronkova (2004), Cappieollo, et al. (2006), Babetskii et al. (2007), Egert and Kocenda (2007), Cerny and Koblas (2008), Gilmore et al. (2008) and Kocenda and Egert (2011). However, the stock markets comovements in South Eastern Europe (SEE) have been analyzed rather rarely.

Kenourgios and Samitas (2011) examine long-run relationships among five Balkan emerging stock markets (Turkey, Romania, Bulgaria, Croatia, Serbia), the United States and three developed European markets (UK, Germany, Greece), during the period 2000–2009. Using conventional and regime-switching cointegration tests and Monte Carlo simulation, the results provide an evidence in favour of a long-run cointegrating relationship between the Balkan emerging markets within the region and globally. Gradojevic and Dobardzic (2012) employ frequency domain approach to analyze the causal relationship between the returns on main indexes of Croatia, Slovenia, Hungary and Germany on the return of the major Serbian stock exchange index. The results found evidence of a somewhat dominant effect of the Croatian and Slovenian stock exchange indexes on Serbian stock index across a range of frequencies. Horvath and Petrovski (2013) examine the international stock market comovements between Western Europe vis-àvis Central (the Czech Republic, Hungary and Poland) and South Eastern Europe (Croatia, Macedonia and Serbia) using multivariate GARCH models in 2006–2011. The results indicate that the degree of comovements is much higher for Central Europe.

In this paper, we use method proposed by Bae et al. (2003) to investigate the comovements in the extreme returns between SEE stock markets. Extreme returns in one country, or exceedances, are large positive and large negative returns only in that country. Coexceedances are the joint occurrences of extreme returns in different countries. We divide the SEE countries on two groups: EU accession countries and EU member countries and use the multinomial logit model to explain the coexceedances that occurs in each group. Specifically, we allow transitory effects from major EU economies stock markets to EU member countries from SEE, and in addition, transitory effects from EU member countries from SEE to accession countries from SEE region. Following Christiansen & Ranaldo (2009) we test the persistence effects, asset class effects and volatility effects on the likelihood of the coexceedances in each SEE groups. Persistence effects refer to the likelihood of observing autocorrelation in the coexceedances, i.e. whether the extreme stock returns are followed by subsequent movements in the same direction or in the opposite direction. The asset class effects test the explanation power of the three asset class groups, namely interest rates, currency returns and stock returns, for extreme stock returns. Finally, the volatility effects refer to the link between extreme stock returns and volatility in interest rates, currency returns and stock returns.

We find strong persistence effects in the both SEE groups (EU member states and EU accession countries). The extreme stock returns are characterized with subsequent movement in same direction. The coexceedances in EU member countries from SEE stock markets are influenced by the coexceedances in major EU economies stock markets, while in the case of EU accession countries from SEE stock markets this influence is much weaker and present only for positive coexceedances. However, negative coexceedances of accession countries

from SEE are influenced by negative coexceedances from EU member countries from SEE stock markets, which imply that in the accession group stock markets bad signals comes from region, while good signals comes from the major EU economies. In respect to asset class effects and volatility effects, the results suggest that later have more influence on extreme coexceedance on the SEE stock markets than the former. The volatility of the observed stock markets is important in determination of the extreme returns comovement in the both group of SEE markets.

The results of this study may help policy makers to understand the nature of cross-region shock transmission. Similarly, it may be useful to investment managers for international portfolio diversification.

The structure of the remaining part of the paper is as follows: In Section 2 we present the data and in Section 3 we explain methodological framework. Section 4 contains the empirical results, and Section 5 concludes.

## 2   Data Description

We consider three groups of countries, while each is consisted of five countries. The first two groups are SEE groups. The criterion for division is the EU membership. The first is the group of EU accession countries from SEE: Bosnia and Herzegovina, Macedonia, Montenegro, Serbia and Turkey. Albania and Kosovo are not included due data availability. The second is the group of EU member countries from SEE: Greece, Slovenia, Romania, Bulgaria and Croatia. Greece and Slovenia were EU members during total sample period, while the rest of the countries only the part of the sample period. However, in the models we use dummy variables to capture effect of January 1, 2007, when majority of the countries in this group are EU members. The group of major EU economies, according to nominal GDP in 2012, consists of the following countries: Germany, United Kingdom, France, Italy and Spain.

We apply the daily data from DataStream stock index for various countries. Only in the cases of Bosnia and Herzegovina, Croatia, Macedonia, Montenegro and Serbia, we use the relevant index from the local stock market (SASX10, CROBEX, MBI10, MONEX20 and BELEXline), because the DataStream stock index is not available.

We use daily log returns calculated from the price indexes for the stock markets measured in the local currency. Christiansen & Ranaldo (2009) argue that local currency returns are equivalent to currency hedged returns, while using common currency returns would bias the results and confound the genuine stock performance with that of the exchange rates. The data covers the period from October 4, 2004 to November 13, 2013. It gives a total of 2378 observations and covers both bull and bear phases, high and low volatility and different market conditions.

### 2.1 Coexceedance Variables

We focus on occurrences of extreme returns. We arbitrarily define a negative (positive) extreme return, or negative (positive) exceedance, as one that lies below (above) the 10% (90%) percentile of the marginal return distribution. We treat extreme negative and extreme positive returns separately.

Following Christiansen & Ranaldo (2009) we construct a variable that counts the number of extreme negative returns for EU accession countries from SEE on a given day. The variable can take on integer values between 0 and 5. We collect observations of 2 and above into one group, so the variable is truncated to take on values between 0 and 2. We denote this variable the negative coexceedance variable for the EU accession countries group. So, we distinguish between following situations for a given day: no extreme return, only one country with an extreme return, and several countries with an extreme return. A similar negative coexceedance variables are constructed for the group of EU member countries from SEE and group of major EU economies. The positive coexceedance variable for the EU accession countries is constructed by counting the number of positive extreme returns on the EU accession stock markets on a given day. Finally, we construct the positive coexceedance variables for the group of EU member countries from SEE and group of major EU economies. We use the following notation for the coexceedance variables:

- $XN_t^{ACC}$: negative coexceedance for EU accession countries from SEE on day $t$.
- $XP_t^{ACC}$: positive coexceedance for EU accession countries from SEE on day $t$.
- $XN_t^{EUS}$: negative coexceedance for EU member countries from SEE on day $t$.
- $XP_t^{EUS}$: positive coexceedance for EU member countries from SEE on day $t$.
- $XN_t^{MEU}$: negative coexceedance for major EU economies on day $t$.
- $XP_t^{MEU}$: positive coexceedance for major EU economies on day $t$.

Summary statistics for the coexceedance variables are given in Table 1. The 2378 days in a sample period are divided into these in which there are no exceedances in any country (e.g. 1558 such days in group of EU accession countries for negative extreme returns), only one country exceedance (e.g. 568 such days in group of EU accession countries for negative extreme returns), and multi country coexceedance (e.g. 252 such days in group of EU accession countries for negative extreme returns). The number of several coexceedances (multi country coexceedance), as well as the number of no coexceedance (no exceedance in any country) is highest in

the group of major EU economies (in both positive and negative cases) which reflect the higher level of interconnection and stability of this group in comparison with the SEE groups. Both group of SEE countries have more negative than positive coexceedances, while the group accession countries from SEE have more coexceedances than EU member countries from SEE.

|  | Number of Coexceedances | | |
|  | 0 | 1 | 2+ |
|---|---|---|---|
| Negative Coexceedances in EU accession countries from SEE (ACC) | 1558 (65.5%) | 568 (23.9%) | 252 (10.6%) |
| Positive Coexceedances in EU accession countries from SEE (ACC) | 1498 (63.0%) | 641 (26.9%) | 239 (10.1%) |
| Negative Coexceedances in EU member countries from SEE (EUS) | 1615 (67.9%) | 517 (21.7%) | 246 (10.4%) |
| Positive Coexceedances in EU member countries from SEE (EUS) | 1535 (64.6%) | 595 (25.0%) | 248 (10.4%) |
| Negative Coexceedances in major EU economies (MEU) | 1969 (82.8%) | 129 (5.4%) | 280 (11.8%) |
| Positive Coexceedances in major EU economies (MEU) | 1946 (82.0%) | 126 (5.3%) | 303 (12.7%) |

*Table 1. Summary statistics of coexceedance variables*

### 2.2 Explanatory Variables

In the empirical analysis, we also use additional explanatory variables in order to estimate the impact of the different stock markets or the economic fundamentals on the coexceedance variable in various multinomial logit models. In the choice of the variables we follow the existing literature, and select to a large extent the same variables as Bae et al. (2003) and Christiansen and Ranaldo (2009). The frequency of all the explanatory variables does correspondents with the daily frequency of the coexceedance variables. The variables are as follows:

- $S_t^{USA}$: concurrent return from the US stock market (DataStream index).
- $S_t^{MEU}$: concurrent return from the major EU economies stock market (log-returns from equally weighted index constructed for the Germany, United Kingdom, France, Italy and Spain).
- $S_t^{EUS}$: concurrent return from the EU member countries from SEE stock market (log-returns from equally weighted index constructed for the Greece, Slovenia, Romania, Bulgaria and Croatia).
- $\sigma_t^{USA}$: concurrent volatility for US stock market (square root of the conditional variance stemming from estimating the AR(1)-GARCH(1,1) model for the US stock return - $S_t^{USA}$).
- $\sigma_t^{MEU}$: concurrent volatility for major EU economies stock market (square root of the conditional variance stemming from estimating the AR(1)-GARCH(1,1) model for the major EU economies stock return - $S_t^{MEU}$).
- $\sigma_t^{EUS}$: concurrent volatility for EU member countries from SEE stock market (square root of the conditional variance stemming from estimating the AR(1)-GARCH(1,1) model for the EU member countries from SEE stock return - $S_t^{EUS}$).
- $C_t$: concurrent currency log return (exchange rate of EUR per USD).
- $\sigma_t^C$: concurrent volatility for currency return (square root of the conditional variance stemming from estimating the AR(1)-GARCH(1,1) model for the currency log return - $C_t$).
- $R_t$: concurrent interest rate (first differences of 1-month EURIBOR).
- $\sigma_t^R$: concurrent volatility for currency return (square root of the conditional variance stemming from estimating the AR(1)-GARCH(1,1) model for the interest rate - $R_t$).

## 3   Methodological Framework

In the first part of the section we present the econometric technique of multinomial logistic regression. In the second part of the section we describe the models used for hypothesis testing.

### 3.1 Multinomial Logistic Regression

We used the Bae et al. (2003) method of multinomial logit model to analyze extreme commovements between stock markets. This method offers a more efficient (in econometric terms) and consistent (in economic terms) way of analyzing commovement between financial markets, because coexceedance measure is not biased in periods of high volatility, it is not restricted to model linear phenomena, and it is easy to compute across time and assets.

Multinomial logit model is appropriate for modeling coexceedance variables, which as discussed above are discrete choice variables that can have only three categories (0, 1, and 2). We conduct univariate analysis and

model one coexceedance variable at the time. The probability of, for example, $XN_t^{ACC}$ being in category $i$ is given by:

$$P_i = \frac{exp(\boldsymbol{\beta}_i'\boldsymbol{x})}{\sum_{j=1}^2 exp(\boldsymbol{\beta}_i'\boldsymbol{x})}$$

where $i = 1, 2$; $\boldsymbol{x}$ is the vector of the explanatory variables (including constant) and $\boldsymbol{\beta}_i$ is the vector of coefficients for category $i$. The probability of being in category $i$ is given as a function of explanatory variables $P_i = function(\boldsymbol{\beta}_i'\boldsymbol{x})$ where $i = 1, 2$. There is one coefficient for each covariate for each of the categories (for example, $\beta_{1j}$ for category 1 for $x_j$). The baseline category is 0 ($i = 0$).

Considering only three categories (0, 1 and 2), we reduce the number of parameters in the model and make the results easier to understand. The explanation of the coefficients is straightforward: when $\beta_{1j}$ is significant, then variable $j$ has a positive effect upon the probability of the occurrence of an exceedance; when $\beta_{2j}$ is significant, then variable $j$ has a significant effect upon the probability of the occurrence of a coexceedance. The significance of a given explanatory variable i.e. whether both coefficients for both categories are insignificant simultaneously ($\beta_{1j} = \beta_{2j} = 0$ for explanatory variable $x_i$) is checked with $\chi^2$-test. The joint significance of all the explanatory variable is determined by use of $\chi^2$-test, where we compare the estimated model with the base line model that only has the constant term as explanatory variable). In addition, we calculate a Cox and Snell's pseudo$R^2$ for various models.

The multinomial logit model is estimated in SPSS.

### 3.2  Hypotheses and Models
*Persistence effects*

The first hypothesis is about the persistence of the extreme returns in the SEE stock markets. We explore whether negative and positive coexceedances in stock prices are followed by subsequent movements in the same direction (continuation) or in the opposite direction (reversal). The empirical literature has identified both patterns in the developed markets. De Bondt and Thaler (1985) influenced by experimental psychology documentation of the overreaction of the people to unexpected and dramatic news, found reversal pattern in long-term stock return, i.e. stocks with low long-term past returns tend to have higher future returns as the result of the correction of the initial overreaction. Jegadeesh (1990) and (Lehmann, 1990) provide evidence on reversal pattern in short term stock returns. In contrast, Jegadeesh and Titman (1993) and Fama and French (1996) have found continuation pattern of short term stocks returns, i.e. stocks with higher returns tend to have higher future returns.

We use two model forms in order to test the persistence effects in SEE stock markets. The first form of the model test whether the coexceedances in EU member countries from SEE group stock markets are autoregressive and whether they are related to the coexceedances of the same type in major EU economies group stock markets. So, for the negative coexceedance variable for the EU member countries from SEE ($XN_t^{EUS}$) the explanatory variables are $XN_{t-1}^{EUS}$ and $XN_t^{MEU}$. For $XN_t^{EUS}$ the probability of having $i$ negative coexceedances is:

For $XN_t^{EUS}$: $P_i = function(\beta_{i0} + \beta_{i1} XN_{t-1}^{EUS} + \beta_{i2} XN_t^{MEU})$ where $i = 1, 2$.

The model form is similar for the positive coexceedance variable, where explanatory variables are $XP_{t-1}^{EUS}$ and $XP_t^{MEU}$. The second form of the model test whether the coexceedances in EU accession countries from SEE group stock markets are autoregressive and whether they are related to the coexceedances of the same type in EU member countries from SEE and major EU economies group stock markets. We think that transitory effect of the integrated markets in the EU from the SEE is important in modeling of the coexceedanes of accession countries. So, for the negative coexceedance variable for the EU accession countries from SEE ($XN_t^{ACC}$) the explanatory variables are $XN_{t-1}^{ACC}$, $XN_t^{EUS}$ and $XN_t^{MEU}$. For $XN_t^{ACC}$ the probability of having $i$ negative coexceedances is:

For $XN_t^{ACC}$: $P_i = function(\beta_{i0} + \beta_{i1} XN_{t-1}^{ACC} + \beta_{i2} XN_t^{EUS} + \beta_{i3} XN_t^{MEU})$ where $i = 1, 2$.

*Asset class effects*

The second hypothesis is about the asset class effects on the extreme returns in the SEE stock markets. We explore whether currency rate and interest rates movements, as well as American and European stock markets developments, are relevant for explaining coexccedances in SEE stock markets. Obstfeld (1986) and Morris and Shin (1998) suggested currency attacks as important source of extreme returns transmission, while funding liquidity and market liquidity is pointed out by Brunnermeier and Pedersen (2009). Moreover, Caballero and Krishnamurthy (2008) put a light to flight to quality episodes (substitution between equities and safer assets such as bonds or money) as important source of financial instability. In addition, Christiansen and Ranaldo (2009)

argue that EU membership may have decreased the currency risk premium and increased the degree of stock return correlation within new member states and between them and old member states.

As in the case of persistence effects, we use two model forms in order to test the asset class effects in SEE stock markets. The first form of the model test whether the coexceedances in EU member countries from SEE group stock markets are related to different assets type returns. The explanatory variables are: currency return ($C_t$), interest rate ($R_t$), major EU stock market return ($S_t^{MEU}$) and US stock market return ($S_t^{USA}$). So, for the negative coexceedance variable ($XN_t^{EUS}$) the probability of having $i$ negative coexceedances is:

For $XN_t^{EUS}$: $P_i = function\big(\beta_{i0} + \beta_{i1}C_t + \beta_{i2}R_t + \beta_{i3}S_t^{MEU} + \beta_{i4}S_t^{USA}\big)$ where $i = 1, 2$.

The model form is identical in the case of positive coexceedances in EU member countries from SEE ($XP_t^{EUS}$). The second form of the model designed for EU accession countries from SEE stock markets have additional variable EU member countries for SEE stock market return ($S_t^{EUS}$), in order to be captured regional transitory effect. So, for the negative coexceedance variable ($XN_t^{ACC}$) the probability of having $i$ negative coexceedances is:

For $XN_t^{ACC}$: $P_i = function\big(\beta_{i0} + \beta_{i1}C_t + \beta_{i2}R_t + \beta_{i3}S_t^{EUS} + \beta_{i4}S_t^{MEU} + \beta_{i5}S_t^{USA}\big)$ where $i = 1, 2$.

*Volatility effects*

The third hypothesis is about the volatility effects on the extreme returns in the SEE stock markets. We explore whether coexceedanes are more likely to occur in highly volatile environment overriding all asset classes. Leveraged international allocations may also increase extreme events propagation. Schinasi and Smith (2001) show that even in an efficient and frictionless setting, spillover effects can emerge on the basis of optimal portfolio decisions taken by leveraged investors as a simple rebalancing response.

We use two different model forms in order to test the asset class effects in SEE stock markets. The first form of the model test whether the coexceedances in EU member countries from SEE group stock markets are related to volatility of different assets type returns. The explanatory variables are: volatility of currency return ($\sigma_t^C$), volatility of interest rate ($\sigma_t^R$), volatility of major EU stock market return ($\sigma_t^{MEU}$) and volatility of US stock market return ($\sigma_t^{USA}$). So, for the negative coexceedance variable ($XN_t^{EUS}$) the probability of having $i$ negative coexceedances is:

For $XN_t^{EUS}$: $P_i = function\big(\beta_{i0} + \beta_{i1}\sigma_t^C + \beta_{i2}\sigma_t^R + \beta_{i3}\sigma_t^{MEU} + \beta_{i4}\sigma_t^{USA}\big)$ where $i = 1, 2$.

The model form is identical in the case of positive coexceedances in EU member countries from SEE ($XP_t^{EUS}$). The second form of the model designed for EU accession countries from SEE stock markets have additional variable EU member countries for volatility of SEE stock market return ($\sigma_t^{EUS}$), in order to be captured regional transitory effect. So, for the negative coexceedance variable ($XN_t^{ACC}$) the probability of having $i$ negative coexceedances is:

For $XN_t^{ACC}$: $P_i = function\big(\beta_{i0} + \beta_{i1}\sigma_t^C + \beta_{i2}\sigma_t^R + \beta_{i3}\sigma_t^{MEU} + \beta_{i4}\sigma_t^{USA} + \beta_{i5}\sigma_t^{EUS}\big)$ where $i = 1, 2$.

## 4  Empirical Results

Table 2 reports the estimation results of the multinomial logit model for the four different coexceedance variables. The left-most part of the table concerns the situation where the negative coexceedance variable for the EU members from SEE is the explained variable, in the second part the positive coexceedance variable for the EU members from SEE is the explained variable, and in the third and fourth parts the negative and positive coexceedances for EU accession countries from SEE are the explained variables. The first two columns show the parameter estimates and their standard deviations in parenthesis. In the third column, */**/*** indicate the significance of the individual parameter ($\beta_{ij}$) at a 10%/5%/1% level of significance. In the fourth column, it is marked by &/&&/&&& when the explanatory variable $x_j$ is overall significant at the 10%/5%/1% level of significance ($\beta_{1j} = \beta_{2j} = 0$). We include an intercept dummy, as well as interaction dummies for the explanatory variables in the model, where the dummy variable takes value 1 after January 1, 2007 and zero before. The estimates are not tabulated, but the joint significance level (10%/5%/1%) of the dummies variables is indicated by #/##/### in the fifth column in the every of the fourth parts of the table.

The table 2 reports the persistence effects results. The estimated significant and positive lagged explanatory variable in all four models is evidence in favor of the continuation hypothesis (subsequent movements in the same direction) in the SEE markets rather than reversal hypothesis (subsequent movements in the opposite direction). It implies that the number of extreme negative returns today is positively related to the number of extreme negative returns yesterday in the both SEE groups. Or, that the number of extreme positive returns today is positively related to the number of extreme positive returns yesterday in both SEE groups.

Regarding extreme returns in major EU economies markets as explanatory variable, we found them significant and positive in the two models of EU member states from SEE. It means that the more extreme negative returns

we have on major EU countries stock markets, the more likely is to have many extreme negative returns on the EU member states from SEE stock markets. On contrary, the extreme returns in major EU economies stock markets are not significant in the model of negative coexceedance for accession countries from SEE, while it is significant only on 10% level for the extreme positive coexceedance of the same group. For the model of negative coexceedance for accession countries from SEE, the additional explanatory variable – negative coexceedance for EU member states from SEE is significant and positive. It implies that the extreme negative influence of major EU countries stock markets on the extreme negative returns of the accession countries is not directly, but through the EU member states from SEE stock markets. However, this is not true for the extreme positive returns of the accession group. The positive coexceedance of accession group is not influenced by positive coexceedance of EU member states group, but only from positive coexceedances from major EU economies group. It means that in accession group stock markets bad signals comes from the region, while good signals from the major EU economies.

The results for the asset class effects are given in the table 3. For the EU member countries from SEE, the likelihood of observing negative coexceedances is only related to major EU economies stock market return. In particular, it is negatively related to stock returns in major EU economies market. For the positive coexceedance variable for EU member countries from SEE both the major EU economies stock return and the currency return have significant effects, but on the 10% level. The effect of major EU economies stock return is positive, while the effect of the exchange rate of EUR per USD is negative. In both cases (negative or positive coexceedance variable) for EU member countries from SEE the interest rate or US stock market return are not of importance.

The likelihood of observing negative coexceedances in EU accession countries from SEE appear more highly connected with EU member states from SEE stock returns than with major EU economies stock return. These links have negative effects upon the likelihood. Also, there is positive link with interest rates, but to lesser extent. The positive coexceedance variable for EU accession countries from SEE seems to be almost not connected with the observed variables, with the exception of the weak link with the US stock market return.

**Table 4.** *Volatility effects*

The results for volatility effects are given in table 4. For the negative coexceedance variable for EU members countries from SEE, we find only stock markets returns volatility significant, whereas the exchange rate volatility and interest rate volatility is insignificant. The US stock market return volatility and in major EU economies stock market volatility increase the likelihood of negative coexceedance. The positive coexceedance variable for EU member countries from SEE it is not related with any observed asset class volatility.

For the EU accession countries from SEE, the volatility in all three stock markets (US, major EU economies and EU members from SEE) is relevant for likelihood of observing coexceedances. In both negative or positive coexceedances models the increase in volatility in US stock market or EU members from SEE stock market leads to increase of the likelihood of observing a coexceedances in EU accession stock markets. In addition, for the accession countries negative coexceedances, there is weak link with exchange rate volatility and for positive coexceedances with interest rate volatility.

## 5  Conclusion

We apply the coexceedance methodology of Bae et al. (2003) to investigate the co-movements in the extreme returns between SEE stock markets. We divide the SEE stock markets on two groups based on country's EU membership in order to allow for transmission mechanism from major EU economies stock markets to EU member countries from SEE, and in addition, transitory effect from EU member countries from SEE to accession countries from SEE region. The negative coexceedance variable for the EU accession countries from SEE counts the number of extreme returns (bellow 10% percentile) across the EU accession countries on a given day. The positive coexceedance variable for the EU accession countries from SEE counts the number of extreme returns (above 90% percentile) across the EU accession countries on a given day. The negative coexceedance variables and positive coexceedances variables for the EU member countries from SEE and major EU economies are constructed analogously. Using the multivariate logit model, we test the persistence, asset class and volatility effects on the likelihood of the coexceedances in both SEE groups.

We find evidence in support of continuation hypothesis for the extreme negative and positive stock returns in the both SEE groups (EU member states and EU accession countries). The coexceedances in EU member countries from SEE stock markets are influenced by the coexceedances in major EU economies stock markets, while in the case of EU accession countries from SEE stock markets this influence is much weaker and present only for positive coexceedances. However, negative coexceedances of accession countries from SEE are influenced by negative coexceedances from EU member countries from SEE stock markets, which imply that in the accession group stock markets bad signals comes from region, while good signals comes from the major EU economies. In respect to asset class effects and volatility effects, the results suggest that later have more influence on extreme coexceedance on the SEE stock markets than the former. The volatility of the US stock markets is important in determination of the extreme returns comovement in the both group of SEE markets, while for the accession group additionally volatility of the EU member countries from SEE is important.

# The Impact of Stock Prices on Consumption and Interest Rate in Turkey: Evidence from a Time Varying Vector Autoregressive Model

Ph.D. Candidate Evrim Toren (Eastern Mediterranean University, Cyprus)

## Abstract

This paper aims to examine the spillovers from stock prices onto consumption and interest rate for Turkey by using a time-varying vector autoregressive model with stochastic volatility. A three-variable time-varying vector autoregressive model is estimated to capture the time-varying nature of the macroeconomic dynamics in the Turkish economy between real consumption, nominal interest rate and real stock prices. In order to obtain the macroeconomic dynamics in a small open economy, the data covers the period 1987:Q1 until 2013:Q3 in Turkey. The sample data is gathered from the official website of Central Bank of the Republic of Turkey. Overall, this study provides the evidence of significant time-varying spillovers on consumption and interest rate coming from the stock market during financial crises and implications of monetary policy in Turkey. In addition, a time-varying vector autoregressive model with stochastic volatility offers remarkable results about the impact of price shock on consumption levels in Turkey.

## 1  Introduction

The relationship between an increase in wealth, whether from real stock (asset) price, real estate or other financial assets and consumption can be explained by the permanent income hypothesis (Friedman, 1957). According to the permanent income hypothesis, real stock (asset) price inflation leads to an increase in the expected lifetime wealth of households and their consumption (Friedman, 1957). In this respect, there is a review of literature regarding the wide international evidence about the major spillovers from the stock market to consumption not only in advanced economies but also in emerging economies. For example, Lettau and Ludvingson (2001) claim that there is an inevitable role of fluctuations in the consumption-wealth ratio for estimating stock returns in the U.S. They find out that the fluctuations in the consumption wealth ratio are very effective, while predicting real stock returns and excess returns on a Treasury bill rate.

As Apergis and Miller (2004) argue, the stock market wealth asymmetrically affects real per capita consumption in the United States. Additionally, Fratzscher and Straub (2010) examine the relationship between asset prices and current account positions for 42 industrialized and emerging market countries. In their study, they model asset price shocks as news shocks about the future productivity. They conclude that the channels via wealth effects and the real exchange rate are very important when the heterogeneity exists in the transmission.

Consistent with these studies, Koivu (2012) analyzes the dynamics between monetary policy, asset prices and consumption in China. Koivu (2012) contends that a loosening of Chna's monetary policy results in higher stock (asset) prices. In addition, a positive shock to residential prices leads to an increase in household consumption when the role of stock prices are very small in China. Using the quarterly, seasonally adjusted data for the euro-area, Sousa (2010) also shows the impact of wealth on consumption. For Sousa (2010), the estimates suggest that wealth effects are particular for currency and deposits, shares and mutual funds. Thus, consumption reacts quickly and positively to the financial liabilities and mortgage loans in the euro area.

When Turkey is concerned, there is are limited studies, which focus on the dynamics in the stock market and the effects on consumption. Binay and Salman (2008) examine the wealth effects on total consumption when the real estate increases by a percent. According to the research findings, Binay and Salman (2008) conclude that a percent change in stock market indexes lead to an increase in consumption in durables. Aydede (2007) investigates the effects of unfunded social security system on consumption for Turkey by using Engle-Granger methodology. In addition, there are also two papers that look at the behavior of the growth performance of Turkish economy by Ulengin and Yentürk (2001) and Çimenoğlu and Yentürk (2005). Both papers use vector autoregression (VAR) models to show how the private consumption is linked to the short-term capital inflows in the stock market of Turkey.

In light of the articulations above, the objective of this paper is to analyze the impact of stock prices on consumption and interest rate in Turkey. Throughout the paper, the methodology does not rely on constant parameter models, as stated in the literature. Time-varying parameter vector auto regressives (TVP-VARs) are very useful for the analysis of macroeconomic issues and offer the time-varying nature of the underlying structure in the economy (Nakajima, 2011). In this view, a TVP-VAR model with stochastic volatility is used in this study. This paper aims to investigate not only the time-varying spillover effect of stock price shocks on consumption and interest setting behavior, but also the general relationship between the variables in a small-open economy.

The major structural changes and shifts in the Turkish economy over the period of the analysis make Turkey as a country of investigation in this paper. Thus, this study is the fist, which aims to analyze the spillover effect of real stock prices on real consumption and nominal interest rate by using the TVP-VAR model in Turkey. The remainder of the paper is organized as follows: Section 2 introduces the methodology of the TVP-VAR technique. Section 3 specifies the data that is used. Section 4 is devoted to the presentation of the results of a stock price shock on consumption and interest rate. Finally, section 5 summarizes the basic findings and insights of the paper.

## 2  Methodology

Quantifying and analyzing macroeconomic fluctuations has been one of the most important subjects in the economic literature. The pioneer article "Macroeconomics and Reality" by Sims (1980) introduces a vector autoregression (VAR) for the investigation of macroeconomic fluctuations. Sims (1980) contends that the parameters in the VAR specification act according to a first order random walk process, hence the VAR constitutes both temporary and permanent changes to the parameters. In this study, a TVP-VAR model with stochastic volatility proposed by Primiceri (2005) is applied.

According to Nakajima (2011), the TVP-VAR model with stochastic volatility provides possible changes while examining structure of the economy in a flexible and robust manner. The existence of stochastic volatility is very important in this paper because the TVP-VAR model with stochastic volatility prevents the results from having misspecifation, hence the model is estimated by using Markov Chain Monte Carlo (MCMC) methods. The existence of a Bayesian inference enables the model to estimate the TVP-VAR models via MCMC methods in this study. The objective of MCMC methods is to evaluate the joint posterior distributions of the parameters of interest (Nakajima, 2011).

The estimation of a time-varying parameter VAR model with stochastic volatility of the form can be expressed by following Nakajima (2011):

$$y_t = c_t + B_{1t}\, y_{t-1} B_{st}\, y_{t-s} + e_t, e_t \sim N(0, \Omega_t), (1)$$

For t=s+1, …,n, where $y_t$ is a (kX1) vector of observed variables, $B_{1t}, \ldots B_{st}\, are\, (kXk)$ matrices of time varying coefficients, and $W_t$ is a (kXk) matrices of time-varying covariance matrix. Thus, the time varying parameters follow a random walk process in this study.

## 3  Data

The study examines the data, which covers the quarterly period of 1987:Q1 until 2013:Q3 in Turkey. This study estimates a three variable TVP-VAR model in order to assess the time varying nature of the macroeconomic dynamics in the Turkish economy by using real consumption, nominal interest rate and real stock prices. The sample data is gathered from the official website of Central Bank of the Republic of Turkey.

The standard unit root tests, namely, Augmented Dickey Fuller (1981) (ADF), Phillips Perron (1988) (PP), Dickey fuller with generalized least squares detrending (DF-GLS), the Kwiatkowski, Phillips, Schmidt and Shin (1992) (KPSS), the Elliot, Rotherberg and Stock (ERS) (1996) point optimal test, the Ng-Perron (2001) modified versions of the PP (NP-MZt) test and the ERS point optimal (NP-MPt) test are followed in this study.

The variables such as real consumption and real stock prices are found to be non-stationary. Thus, these variables are converted to their corresponding growth rates and named as *DRSP* and *DRC*. The nominal interest rate is also found to be stationary by using ADF, DF-GLS, ERS, NP-MZt and NP-MPt tests and specified as *DR*.

The stable TVP-VAR is estimated based on four lags by using all the popular lag-length tests, namely the sequential modified LR test statistic, the Akaike information Criterion and the Schwarz information criterion.

## 4  Results

The posterior estimates are computed by drawing M= 10000 samples. Table.1 illustrates the estimates for the posterior means, standard deviations, 95% credible intervals, the convergence diagnostics (CD) of Geweke (1992) and the inefficiency factors of parameters of TVP-VAR model.

The CD statistics confirm that the null hypothesis of the convergence to the posterior distribution is not rejected at the 5 percent level of significance. When the efficiency factors are taken into consideration, Table.1 shows that the efficiency factors are not so high in general. Since the 95 percent confidence intervals include the estimated posterior mean for every parameters in the TVP-VAR model, the MCMC algorithm provides posterior draws efficiently.

| Parameter | Mean | Std. Dev. | 95% U | 95% L | CD | Inefficiency |
|-----------|------|-----------|-------|-------|-----|--------------|
| sb1 | 0.1258 | 0.0638 | 0.0545 | 0.3002 | 0.959 | 158.98 |
| sb2 | 0.0809 | 0.0431 | 0.0247 | 0.1924 | 0.177 | 129.10 |
| sa1 | 0.0056 | 0.0015 | 0.0035 | 0.0092 | 0.950 | 46.28 |
| sa2 | 0.0056 | 0.0015 | 0.0035 | 0.0095 | 0.000 | 20.24 |
| sh1 | 0.0054 | 0.0014 | 0.0033 | 0.0087 | 0.981 | 30.77 |
| sh2 | 0.0059 | 0.0017 | 0.0036 | 0.0101 | 0.012 | 37.06 |

*Table 1. Estimation Results of select parameters in the TVP-VAR model*

Figure.1 presents the data of the three variables, which are nominal interest rate, real stock prices and real consumption (*DR, DRSP, DRC*) in the top panel. The bottom panel is belonging to the corresponding posterior estimates of stochastic volatility. The nominal interest rates are found to exhibit the most stochastic volatility because Turkey has economic crises since the 1990s. Domestic and international macroeconomic instabilities result in four major crises between 1990 and 2011. According to the results, stochastic volatility of consumption growth in Turkey has started to be highly volatile in the middle of the sample period and peaks around in 2001. In addition, stochastic volatility of consumption is also highly volatile in 1994 and 2007 because of the financial crisis and global crisis, respectively. The stochastic volatility of consumption is low and stable both for the early period of the sample until 1994 and for the period between 2001 and 2008. The low stochastic volatility can be regarded as certainty in consumption period, due to the economic and political environment in Turkey. The real stock returns are highly volatile during the early period of sample. Due to the decline in stock returns, the most stochastic volatility replace in 1994.

*Figure 1. Posterior Estimates for Stockhastic Volatility in the TVP-VAR model*

There are different ways to simulate the impulse responses in the TVP-VAR model. In this study, the impulse responses are computed by not only fixing initial shock size equal to the time series average of stochastic volatility over the sample period, but also by using the simultaneous relations at each point for the comparability of the model (Nakajima, 2011). Figure.2 presents the time varying responses at different horizons of one quarter ahead at each point of the sample for the three variables following a shock to real stock price. In this figure, the mean of the posterior is reported together with 16th and 84th percentiles. When there is a shock to real stock price, the impact on stock price itself is generally positive. The effect is not always significant for the one-quarter a-head horizon. However, a positive shock to real stock price affects consumption positively. The effect on consumption is significant at one-quarter ahead horizon for the entire period. When the nominal interest rate is taken into consideration, the behavior of the interest rate that follows a real stock price increase is very interesting. For the one-quarter ahead impulse responses the effect is positive, but the effect is insignificant especially in the 2001 crisis. In addition, in Figure.2, when there is a shock to nominal interest rate, the impact on interest rate itself is positive.

As is seen in Figure.3, if there is a shock to real stock price, the effect on stock price itself is negative in general but a positive shock to real stock price has a positive impact on nominal interest rate. On the other hand, when consumption is concerned, for the four-quarters ahead, the impulse responses are initially negative, and then become positive especially for the period around 1993, 2000 and 2008.
**Figure 2.** *Impulse Responses of the TVP-VAR model following a real stock price shock, 1-step ahead*

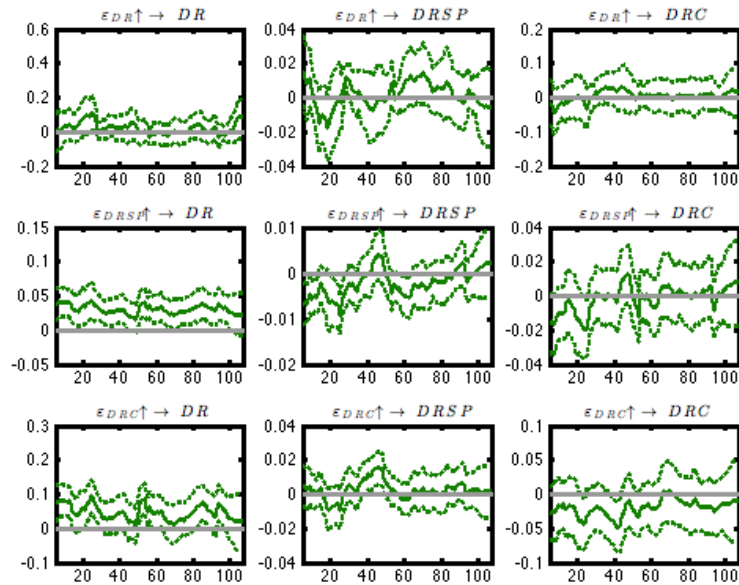

**Figure 3.** *Impulse Responses of the TVP-VAR model following a real stock price shock, 4-steps ahead*

Figure.4 displays the impulse responses at 8-steps ahead. If there is a shock to real stock price itself, the effect on stock price itself is generally positive but the effect is not again significant. In addition, a positive shock to real stock price has interesting effects both on consumption and interest rate. As is seen in Figure 8, although the impulse responses are positive in general, the significant responses are observed after the effect weakened during the turbulence in the economy.

In Figure.5, the impulse responses depict a dissimilar pattern to the 12-quarters ahead horizon because the effects are not bigger at longer horizons. When the time varying response trajectories for the three variables are considered, the positive shock to real stock price have the significant effect on consumption and interest rate.

Figure.6 presents the impulse responses of the model at 1994:Q1. For Rodrik (2012), a misguided attempt to keep interest rate low resulted in a sudden capital outflow in Turkey in this year. Before the crisis hit the economy, a general picture of the Turkish economy was based on the poor fiscal stance, high current account deficit, the overvaluation of Lira, the illiquidity of the government according to international standards and the weak banking sector (Ozatay, 2000). For Ozatay (2000), the crisis was unexpected because of the stable foreign exchange reserve levels and interest differentials in the in the period before the crisis. In light of these statements, the impulse responses belonging to 1994 in Figure.6 confirm that when there is a shock to real stock price, the effect on stock price itself is negative and then becomes positive. Following a positive shock to real stock price also leads to firstly a decrease in consumption and then in increase in consumption. However, the interest rate, which follows a real stock price shock, depicts the positive effect in general.
**Figure 4.** *Impulse Responses of the TVP-VAR model following a real stock price shock, 8-steps ahead*

**Figure 5.** *Impulse Responses of the TVP-VAR model following a real stock price shock, 12-steps ahead*

**Figure 6.** *Impulse Responses of the TVP-VAR model at 1994:Q1*

Figure.7 illustrates impulse responses of the TVP-VAR model at 2000:Q4 because there has been another destructive financial crisis, which is more severe than the crisis in 1994. The Turkish economy was in a severe political and financial crisis on February 19, 2001. Ozatay and Sak (2003) contend that the public sector borrowing requirement, ratio of public debt to GNP, current account deficit, inflation level and the ratio of the liabilities of the financial sector were very high in the last quarter of 2000. Thus, in Figure.7, when there is a shock to real stock price, the impact on stock price itself is generally positive. The effect is also significant for the entire year. A positive shock to real stock price affects consumption positively. Thus, the effect on consumption is significant at 2000:Q1. If the nominal interest rate is concerned, the impulse responses are initially negative and then become positive.

*Figure 7. Impulse Responses of the TVP-VAR model at 2000:Q4*

Figure.8 provides impulse responses of the TVP-VAR model in 2007 because there was a great disturbance in the United States' financial markets in this year. According to Krugman (2009), the financial troubles, which lead to the crisis in the financial markets in the U.S. in 2007 consequently created a full-fledged global crisis in 2008. This crisis developed gradually and evolved into a global crisis that significantly hit the Turkish economy (Yendi and Çetin, 2012). In this view, Figure.8 presents the impulse responses for the three variables of the concern following positive shocks. As is seen, when there is a shock to real stock price, the impact of a real stock price shock on consumption is positive in general. When there is a shock to real stock price, the impact on stock price itself is also positive, too. However, the impulse responses for the interest rate are initially positive, and then become negative.

*Figure 8. Impulse Responses of the TVP-VAR model at 2007:Q1*

Due to the adverse effect of the United States' debt-ceiling crisis of 2011 on the Turkish economy, Figure.9 shows impulse responses of the TVP-VAR model at 2011:Q1. As is seen, a shock to real stock price influences consumption positively because the effect is significant. When there is a shock to real stock price, the impulse

responses are initially positive and then become negative. The effect is not always significant in 2011. However, when the nominal interest rate is taken into consideration, a positive shock to real stock price affects interest rate positively.

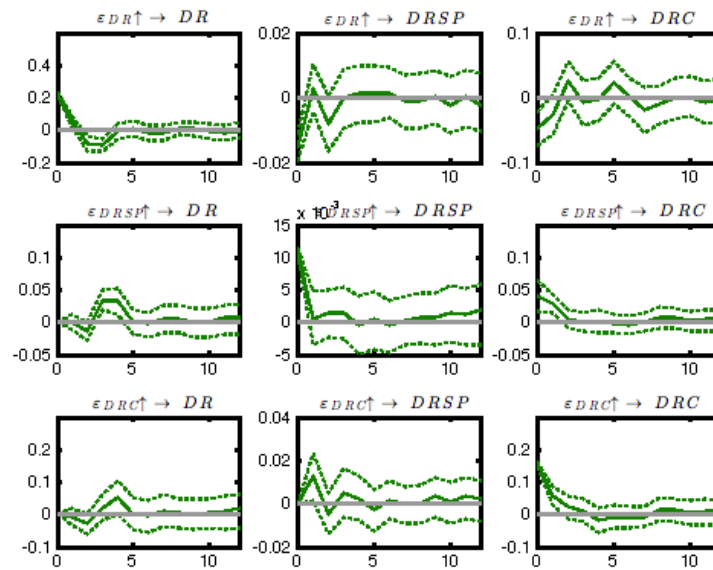

*Figure 9. Impulse Responses of the TVP-VAR model at 2011:Q1*

## 5   Conclusion

In this study, a three variable TVP-VAR model with stochastic volatility is used to show the impact of real stock prices on real consumption and nominal interest rate for Turkey. The sample data covers the quarterly period of 1987:Q1 - 2013:Q3. The study provides the evidence of significant time-varying spillovers on consumption and interest rate coming from the stock market during financial crises and implications of monetary policy in Turkey. According to the research findings, the results confirm that the real stock price shocks affect consumption positively in Turkey with large and significant effects especially at the one step ahead horizon. Additionally, the periods such as 1994, 2000, 2007 and 2011 are examined to evaluate the relationships between variables in the economic crises. In order to capture the variability in the behavior of both consumption and interest rates, this paper suggests the usage of time-varying model with stochastic volatility.

# Consequences of Ineffective Policies and a Risk of Default in Russia and the Eurozone

Prof. Dr. Viktor Barhatov (Chelyabinsk State University, Russia)

Assoc. Prof. Dr. Yuner Kapkaev (Chelyabinsk State University, Russia)

Sergei Poliduts (Chelyabinsk State University, Russia)

## Abstract

The present paper investigates the nature and essence of the state's debt policy and identifies patterns that contribute to the default. It assesses the status and the effectiveness of public debt management both in Russia and several European countries. The paper suggests a number of specific measures and instruments of economic, legal and administrative measures aimed at improving the efficiency of public debt management and minimizing the risk of default. A methodological basis of the study that has served as a dialectical approach, reveals a possibility of studying debt management policies and a study group's practices of dealing with a state debt. A systematic approach to the subject of the study has revealed the existing connections and interdependence between the implementation of debt policy and the process of public debt management. The paper uses some data from the Eurostat and the Rosstat, allowing the complex to investigate the dynamics of basic indicators of the government's debt in Russia and the Eurozone. Based on some determined patterns, the paper identifies the main positive and negative trends of public debt management in the surveyed countries. The assessment of key indicators of the current state of a debt, has revealed a number of contradictions that have a negative impact on the debt burden, which in its turn increases the likelihood of a default. The basic steps to improve the efficiency of public debt management relate to legal aspects and financial planning in conjunction with a skillful use of an administrative resource.

## 1 Introduction

Some lessons have been drawn from the current financial crisis which continues to shake the financial structure of the world in the recent past. The first and the most valuable of them is an understanding of the fact that all financial assets have risks.

Even bonds of many sovereigns are absolutely fairly called into question. Although they are often considered to be "risk-free", because the state can collect taxes from citizens, but one's logic proves the opposite, that is to say, there is nothing risk-free in real life. Such a conclusion may be drawn even after the most superficial acquaintance with a monetary history or while watching events of the past years, which is especially useful and instructive. Undoubtedly, sovereign bonds are risky.

Actually, they are associated with three of such risks. Each of them should be seriously considered and analysed before buying bonds of any country.

Firstly, there is a currency risk. There are two types of such a risk. The first one is an inflation which destroys the purchasing power of currencies since the governments rejected the gold standard many years ago. It is especially a real risk in present conditions when interventions of the Central Bank create artificially underestimated interest rates, and therefore the profitability of bonds can hardly fully neutralise a loss of the purchasing power of currency in which a bond is denominated. Another risk are floating currency quotations. Falling quotations will reduce the cost of the bonds denominated in a foreign currency. For example, any investor from the Eurozone, who owns some bonds denominated in British pounds, suffered losses when the pound sharply fell in price against the euro a few years ago.

Secondly, there is risk associated with interest rates. Although the central banks are actively interfering with credit markets in order to hold interest rates at a low level, the rates will inevitably grow up again. Growing interest rates will cause a fall in prices of bonds. They will fall down to such a level at which the profitability of coupons of bonds will be always equal to a current interest rate.

Thirdly, there is a counteragency risk. The most devastating of all risks is a risk of a default. A country will pay off according to its obligations only if it possesses financial opportunities and a desire to pay. In this regard, investors have drawn a lesson from the latest events, consisting in that many countries are no more capable of servicing their debts even if they wished.

Despite all the latest events, many owners of bonds still believe that they will be able to receive a favorable ratio of a risk to profitability, having bought some state bonds. Probably, in the past things looked like this, but today the majority of governments are hampered with debts and are on the edge of an abyss. It does not make sense any more to expect that a state bond can be bought and held before a maturity date terminates. They became a trade tool which is sold and bought as a commodity resource for the purpose of getting a profit on price fluctuations. It demands unique skills, therefore it is reasonable to leave sovereign bonds to professional traders and speculators.

Many promises made by politicians will be broken because the countries live beyond their means. Including insincere words that state debts will be always serviced. It is obvious that many states worldwide are aground and in such a situation sovereign bonds, without any doubt, bear the risks.

## 2   Methodology and Results

An analysis is presented in the present article regarding the information about the world's state risk of bankruptcy after events that have just recently occurred and that are connected with changes in governmental and economic policy, with an introduction or a failure of rigid budgetary reductions.

A country's risk of bankruptcy/rescue represents an existing possibility of bankruptcy and subsequent pre-default rescue (in the presence of an opportunity). The current level of the gain in the gross domestic product of each of the countries, the total amount of the state debt, governmental and bank debts, a budget deficit, the total amount of an external debt and interest rates of the market of state bonds are taken into account, and in addition, an ability of liquidating a debt by devaluation and inflation is considered, which is impossible for the majority of members of the Eurozone.

Mechanisms of a rescue, introduced at present by the Eurozone, are capable only to delay final bankruptcy; in the event of Greece and Ireland it means financing of deficiencies within three years and debt restructuring, which, as a result, only increases the debt burden of the saved countries and, thus, increases the pressure of indebtedness upon economy as the percentage share of a debt as part of the gross domestic product grows every year, until the time when a country has to re-structure its debts again.

One of the major drivers of default risk generally accepted as significant by several important researches is the country's budget balance in relation to GDP. Another important factor in the literature and also mentioned in the Maastricht Treaty is the total government debt to GDP. A higher indebtedness level raises per se the default risk. In consequence, the country has to spend more funds for debt servicing. In addition to the total outstanding debt, the interest rate costs may also trigger the default risks, as higher interest values are positively correlated to the country's collapse likelihood. Hence, the debt service becomes more expensive and increases the debt burden for the entire economy. Table 1 presents the main determinants of default risk in the Eurozone; this considerable threat on several EMU countries is crucial as it has led to financial turmoil in the region, imposes high costs for all members and questions the very future existence of the EZ.

***Table 1.*** *Determinants of default risk in the Eurozone* **Source:** *The economic world*

The risk of a propagation, in case of a default, of debt commitments is measured by the world's influence of bankruptcy of each country in a percentage of 0% to 100%. The USA possess a 100 percent risk: based on the fact of how bankruptcy of this country will affect the world's financial system, it is meant that this system and, probably, the world's economy will collapse with probability of 100%.

For example, the bankruptcy of Iceland in October 2008 had no essential effect of infection because of its small economic scale and coverage of the external debt, while such countries as Ireland, are characterised by a much bigger factor of infection, therefore the rescue of Ireland by the European Union / the IMF at the rate of 85 billion euros is much less than the expected damage during the propagation of panic and in view of an increase in the risk of a default in other large countries, since contractors of Irish banks and owners of Irish debts will begin to face problems.

However, a rescue does not completely nullify a risk factor of infection because holders of bonds and counter-agents will be as before threatened by a probability of restructuring a debt at some moment in the future, which thus yet escalates to some extent a risk of a default of all other vulnerable countries. A key indicator when determining an effect of infection is the size of economy and the total amount of a debt and promissory notes, including external ones.

A default associated with promissory notes is inevitable in all countries. All countries have a tendency towards a default/debt restructuring. However, the majority of countries declare a default connected with their promissory notes by means of increasing the real rate of inflation. Thus, for most countries a risk of a default is lower because they have an opportunity to avoid it by reducing the cost of their state debt, stealing investors' capital and the purchasing power of employees' salaries by means of inflation.

For example, the Government of Great Britain is printing money which it lends to bankrupt banks at an interest of 0.5% for the purchase of British governmental bonds at am interest of 3.3%. This is why the profitability of these bonds is lower than that of Spanish and Italian bonds: it permits to prevent an instant default, but is done at the expense of a high inflation. In this respect, a falsified official CPI (Consumer Price Index) makes up 3.2%, a more obvious Retail Price Index (RPI) is equal to 4.5%, and the level of the real inflation reaches 6%.

A secret default achieved by means of inflation poses a smaller risk of a full default because the higher is a real rate of inflation (to a certain limit) the lower is a relative risk of an obvious default since governments use inflation for the reduction of the level of a debt at the expense of incomes and savings.

Taking into consideration the fact that all currencies are in a state of a constant free fall relatively to each other, indebtedness expressed in foreign currencies is to pose a lesser threat by itself as compared with that expressed in a local currency – as opposed to the opinion of many experts. If one considers a default caused by a debt by means of inflation based on the British example, then one may see that pound-to-dollar quotations have not changed for the last 20 years. However, the next schedule diagram shows that the pound lost more than 40% of its purchasing power for the same period, proceeding from the evidence of the inflation index (Retail Price Index).

Apart from that, debt denomination in local currency reduces a risk of a default, this is why this risk remains very low in the USA.

On the other side of the debt range of currency devaluation by a real inflation are countries of the Eurozone (PIGIBS), which are locked within the limits of the euro and thus cannot declare a default by means of a real inflation. And even in case of their exit from the currency union they will not be able to solve this problem because their indebtedness is expressed in the euro until it is changed to a new currency, which, in its turn, will lead to an instant enormous devaluation (a panicking effect of a hyperinflation is then possible). Thus, until the countries of PIGIBS remain in the Eurozone, they are only capable of internal devaluation through a reduction of salaries and expenses in order to keep the competitiveness of their economies in comparison with other members of the Eurozone. Although the problem - unlike the opportunity to use inflation for a default associated with a debt expressed in a local currency - consists in that when the economic situation deteriorates a share of indebtedness within the gross domestic product increases, and a risk of a default eventually increases. This is why members of the Eurozone probably will need all new rescues until they declare a default which remains inevitable.

An infection factor is the most important one since countries close to a default, even if they are subsequently rescued, are nevertheless capable of causing a crash of the world's financial system in case their factor of infection reaches such a high level as in Great Britain, France and Germany. Fortunately, there are no signs yet that any of these countries can reach a critical condition close to a default in the next half-year or year so they have time to cope with problems of their budget deficit and bank indebtedness.

Also, despite a widespread opinion about the promissory notes and debts of the USA, there remains a low default level there.

One more important factor should be noted: such countries as Pakistan, Mexico and India bear in themselves a much lesser threat of a default because their external debts are by far smaller, and the sizes of their indebtedness are not so critical as compared with those of members of the Eurozone, this is why the debts of Greece, Ireland and Portugal demand for help, while the above-mentioned countries do not need any rescue. As an initial analysis based on the latest data showed, the world of debt risk has turned upside down, and countries which were considered a few years ago as a high risk zone, now pose a smaller threat, while the low risk zones of the past have become very dangerous.

Portugal along with Belgium and Spain can become candidates for rescue in the nearest time. However, it is possible that after rescuing Spain the help to European bankrupts, PIGIBS countries, will end up, especially if the Eurozone introduces new mechanisms of more ordered partial restructuring of a debt, which is capable of weakening pressure upon the debts of Italy and France and, thus, of reducing the effect of infection.

Meanwhile, all depositors and investors should take care of the protection of their capitals and savings against a risk of infection of PIGIBS, that is reduce susceptibility to a financial risk in banks of the countries of PIGIBS and make sure that sums of deposits come under compensations.

Mechanisms of an organised partial default/restructuring may serve as solutions of a debt crisis.

The Eurozone stands in need of developing mechanisms of partial restructuring of a debt for the purpose of a prevention of a full default demanding an expensive rescue. The present system of financing bankrupt European banks at an interest of 1% does not work with the European Central Bank as it is exactly the prime cause of the present crisis of state indebtedness: after the credit crisis of 2008 the European banks received money from European Central Bank and using it bought highly profitable promissory notes of the countries of PIGIBS, which has resulted in the current situation.

**Figure 1.** *Government debt at the end of the third quarter 2013 by Member State*

One of mechanisms of solving this problem is connected with a future issue of bonds of the countries of PIGIBS, which issue is to be carried out on the basis of an assumption that a certain part of these obligations will not be discharged if an issuer government has a high budget deficit by the time of the incoming of a cancellation date. It will lead to a growth of interest rates for the countries of PIGIBS, reflecting a risk of a partial default, as well as create a systematised market for a slow serial debt default, and it will not cause a crisis striking the entire wholesale market of the debts. For example, an issue of ten-year Portuguese bonds with an interest rate of 8% would be accompanied by a loss of 3% of this capital at a cancellation date for each 1%, if the budget deficit of Portugal exceeded the permitted 3%, or other similar measures were used.

However, the aforesaid mechanism is applicable only to future debts, so it would take many years for the replacement of the existing debt with a new one inclined to a default, therefore, a mechanism of restructuring the existing debt of the countries of PIGIBS, especially Greece, Ireland and Portugal, is necessary as the level of their indebtedness remains unacceptable. The complexity of the issue consists in a partial default associated with Greek, Irish and Portuguese debts, without a subsequent panic in the debt market of the Eurozone, in which Germany will be the only country capable of attracting investors to bonds.

It is obvious that a mechanism of restructuring the debt of the countries of PIGIBS will imply a transformation of European banks and a separation of state debts from bank indebtedness. This is approximately the way how Ireland should have done with its banks, a responsibility for which had had to be assumed by the European Central Bank, and this would have considerably reduced the debt load of the PIGIBS countries.

In the past week, there appeared some signs that the Eurozone intends to carry out a primary assessment of risks for investors of the bond market. However, it is also clear that no country intends to leave the Eurozone, which fact will probably favour Greece and Portugal in a long-term prospect, because these economies will never be able to compete with Germany head-to-head, and therefore they prepare for a decade of a slowed-down growth in comparison with the Eurozone's industrially developed countries. Also, Germany will not leave the currency union because it is content with the condition of the countries of PIGIBS and the weakening of the euro, which permit it to import goods to the domestic market.

By and large, the bond market needs a reason for purchasing state promissory notes: if the situation remains unclear further on regarding what investors will receive when a cancellation date is due, they will not buy them. Thus, for the debt market of the countries of PIGIBS to function, the Eurozone has to ensure a confidence, otherwise the European Central Bank will be the only buyer of these bonds.

When predicting default situations in any country seen most attractive probabilistic assessment model of default.

In particular, the most suitable are:

- actuarial methods to calculate certain objective (as opposed to risk neutral) estimate of the probability of default on the basis of some statistical data on defaults;

- methods based on the market value of bonds, shares and financial derivatives, they define a neutral risk assessment of the likelihood of default and the risk premium for the specific issue of securities.

In our case will be considered the most appropriate actuarial methods for estimating the probability of default, exposure involving relevant actuarial estimates of the probability of default. The economic essence of actuarial models is clearly seen on the example of calculating the probability of default. As you know, a key role in detecting signs of default situations play leading ratings agencies.

Calculations presented agencies are taking up a basis when considering the probability of default of the country under study , as are the most objective and relevant real situation in the country as a whole, and in particular the company, depending on which of the objects under investigation . At the same time, we should not forget about the specifics. In particular, the agency «Moody's», in their study emphasizes the political instability of the country, while making a conclusion about the possibility of default situations in the economy. In turn, the agency «Standart & Poor's» tries to analyze the two main groups of indicators - political and economic. In the study, the country's political indicators Agency explores a combination of factors, and the resulting factor is the willingness to pay its debts, some political will. The study of economic indicators Agency comes from the country's ability to pay its obligations. That's the kind of aggregate function and leads to the calculation of the corresponding numerical value, which is transformed into a letter rating. There are cases when the rating is not assigned, in this case the country's economic situation and the possibility of default is calculated on the basis of their own country's own economic performance.

Consider one example of estimating the probability of default based on the statistics of defaults on bonds, analyzed the data on government bonds of Portugal. To begin with, we define the economic substance of the methodology for assessing the probability of default based on statistics of bond defaults. In this case, the best known in the assessment of the probability of default on the Bonds received studies Altman, 1988-1997. , We should not forget about the methodical operating time Moody's and Standart & Poor's, which has been previously mentioned in more detail. However, if a closer look at the model offered by the named agencies, their methods had its basis rather extensive statistical data and then expressed in a certain regression formula, which summarized the figures for shares of the issuing companies, announced its default in a given year. At the same time, the agency commit serious errors, analyzing the probability of default as a whole company, and the state, focusing only on a one-year period.

However, practice shows that the age of the bond has a significant impact on how the default company level and at the country level. Moreover, the age of the bond significantly affects the probability of default is the first five years. At this time, the company / issuer state funds exist to service its debt.

In addition, the analysis of the likelihood of default is necessary to examine several datasets on bonds.

In particular, you should pay particular attention to the bonds issued in the current year. In this case, the period of the bonds shall not exceed one year, or taken into account in the analysis of the age of the bond. At the same time it is necessary to consider not all parallel marketable bonds, received a credit rating, to focus only on "direct bonds» with a high yield. So it should be noted that similar studies conducted Altman. But his studies were not of conclusive, definite answer to the question of the country defaulted his model, unfortunately, did not offer.

In assessing the probability of default country, special attention must be paid to the bulk characteristics of the bond market, i.e. is a kind of quantity equal to the ratio of (total nominal value) issues of direct high- Portuguese bonds, which is most likely defaulted to the total volume of this kind of bonds in the market.

Investigating the problem of predicting defaults, some Altman calculated weighted average probability of default, where the weights were the relative amounts of bond issues, which was defaulted. In particular, when using this approach can get a situation where two companies have placed their bonds in the market under the same conditions, will dominate the bonds of the company that issued them to a greater extent. Consequently, the default of another company will not have a significant role in the market and distort the estimates of the probability prediction of adverse factors.

But we should not forget that some major defaults could have a very significant impact on the situation on the market and distort the assessment of the likelihood of default for a given period. It should be noted that the Portuguese government bonds will be a kind of barometer by which you can trace the outlines tendency to default since the stock market in this position bonds can play the role of a "safe haven". Market situation can be very diverse, so expect quite a variant growth in demand for Portuguese papers with further sharp drop in bond prices that will be directly connected with the outflow of capital in more liquid and reliable security. In this case, much will depend on the parity of the capital invested in a single Eurobond, and gold prices.

But, despite all the speculation, should still provide a general formula for determining the probability of default.

Marginal probability of default MMR (marginal mortality rate) during the t- th period since the release of bonds in circulation is given by

$$MMRt = \frac{The\ cost\ of\ bonds\ for\ which\ defaulted\ in\ year\ t}{Cumulative\ volume\ bonds\ at\ the\ beginning\ of\ year\ t}$$

The marginal probability of default expresses a statistical evaluation of the probability of default on bonds with a certain credit rating during the t- th year of the date of the paper in circulation. This figure can be expected for several years.

The most interesting and probability value indicative of probability of survival and survival over a certain extended period of time T. Thus, the probability of survival represented by some value SR, unreachable, but tending to 100 %. Therefore, the formula is as follows:

$$SR_t = 1 - MMR_t.$$

In case if you want to consider a longer period of time, you should calculate the probability of survival during the period T as follows:

$$SR_t = \prod_{t=1}^{T} SR_t.$$

Based on the submitted expressions, you can construct a formula the probability of default in year t provided "survival" in previous years, ie during the time period T. By its economic nature, it will be an indicator of the stability of the issuer of the securities, in our case - Portugal.

The formula is as follows:

$$MR_t = MMR_t \cdot SR_{t-1}.$$

If we consider the economic component represented by the expression, we can see that it accumulated all these formulas survival probability of survival, etc. MRt finding is important both for predicting default state, and in predicting defaults private commercial organizations. For example, if we take as a basis the formula probability of default in year t, then we can derive the following formula, which would reflect the probability of default for a specific period of time, as well as predictive formula to assess the situation in the economy, most businesses exposure to defaults.

For example, the probability of default in a specific time period will consist of all the formulas of the probability of default at a certain time T, this period may be due to several years.

The cumulative probability of default CMR (cumulative mortality rate) for the period of time T years is represented as follows:

$$CMR_T = \sum_{t=1}^{T} MR_t = 1 - \prod_{t=1}^{T} SR_t.$$

Thus, the cumulative probability of default - is the probability that an issuer with the credit rating will default at any time between the date of issue of securities in circulation. In our case it is t = 0 and the end of the calendar year T. In addition, the second part of the formula shows that the cumulative probability of default is calculated as add-ons to a single value. In this case, it means «survive" issuer or not, i.e. whether high probability of defaulting in a given period of time.

Another equally significant value represents the average probability of default AMR (average mortality rate), which suggests a certain dimension of the deflection angle of default component in the economy of a single value.

The higher it is, the greater the deviation from a single value, which indicates the overall risk of defaults in the economy. The indicator is calculated as follows:

$$AMR = 1 - \sqrt[T]{1 - CMR_T}.$$

Consequently, the study MMRt and CMR, the analysis of statistical data on these specifications Portuguese bonds, we can state the following pattern: the marginal probability of default increases over the first few years after bond issuance by Portugal. But then the situation has stabilized and the risk (probability of default) is reduced, but it is possible bursts «disbelief" in the Portuguese Securities. This may be due to several reasons. One of them consists in the fact that the borrower rating of Portugal is dominant in deciding whether to buy or

sell securities. The probability of default to the most evident in the first 3 years. The second reason is that the Portuguese paper strongly influenced by the Securities Italy and Greece, which has a very negative impact on the overall market picture. In general, it should be noted that the risk of default is not threatened by the Portuguese Securities, on the contrary, there is a great likelihood of subsequent growth of bonds during 2014 on average by 3-4 %, if we talk in relation to decadal bonds.

Thus, the risk of default and education situation in the economy, and the private enterprise can occur not only in European countries. Default risk and its definition - an important component of the assessment activities of country risk. However, we must focus on the fact that one and acceptable model of default risk assessment to date does not exist.

Recently, certain problems have been observed in Russian economy. In particular, the economic growth has strongly slowed down. Whereas the growth of the gross domestic product of the country was predicted to be about 4 percent for the year 2013 until recently, now it is a question of about 1-2% of growth.

*Table 2. Public debt as a percentage of gross domestic product* **Source:** *Federal service of state statistics*

A default is an inability of the state to fulfill its obligations. And although Russia has some structural problems in the economy, a hole in the pension fund, a noticeable deficiency of the state budget, the country has some international reserves as well, which are estimated approximately at a level of 500 billion US dollars.

In practice, it means that even if a sharp recession in the collectability of taxes is observed in the country (for example, if a crisis arises in 2014), in case the price of oil and gas decreases by 2-2.5 times (as it already happened in 2008-2009), all the same Russia will remain solvent. At the worst, a small devaluation of the ruble may happen in 2014. But it will be of mild nature. An ordinary inhabitant will hardly notice its consequences.

The previous default happened in Russia in 1998. But then the state treasury was almost empty, there were no financial reserves and it was, consequently, impossible to service the debt.

Despite the significant improvement in the quality of debt management that occurred in the 2000s. , In this work are still many shortcomings, some of which have already been mentioned. In general, still lack a strategic

vision, which does not allow long-term strategy to develop multivariate. In addition, the rapidly changing conditions of development, objectively since 2005 makes adjust annually even medium-term policy.

And further debt management conditions will change. Even without major changes in the conditions of economic development in Russia related to the possible deterioration of the external economic situation, new methods will require active management of part of the debt market. Its share of the external debt rose to the top in 2014 to almost 80 % against 17 % in early 2000

In the past, actively discussed the idea of establishing a specialized debt management agency, which is in charge of operational issues have moved to debt management. Such specialized agencies or offices exist in many countries, where public debt consists solely of market-based instruments. However, due to the successful reduction of the external debt issue of agency debt dropped automatically.

However, currently significantly changed conditions of public debt management that allows us to speak about the need to revive the idea of a public debt management agency or office. Besides a significant increase in the share of market-based instruments in the structure of Russia's external debt , new approaches to the management of public debt and increasing demands of domestic debt market, as well as the explosive growth of corporate borrowing , much of which falls on the structures controlled by the state. These functions may perform specialized debt office or agency debt, which could in the longer term to bring an extra effect.

New opportunities for public debt management in open communication with the strengthening of the international position of the ruble. And here more freedom of action in debt policy could give the issue of Eurobonds denominated in rubles. In 2005-2006. already 16 Russian banks and companies have released such Eurobonds totaling 70.5 billion rubles. (almost $ 2.7 billion). In addition, the ruble Eurobond loan put the EBRD, the German government agency KfW, the Norwegian export agency Eksportfinans. This is due, on the one hand, with the abolition of currency legislation in a July 1, 2006 all restrictions on the capital account for non-residents. On the other hand, the increasing demand of Russian and Western institutions for rubles. If such operations successfully succeed corporate structures , that is why they could not perform under certain conditions, the state, through a specialized body of public debt management , which would have followed the situation on the relevant market and engaged in placement and redemption of such debt instruments.

## 3 Conclusion

Special debt agency could engage in monitoring the regional and municipal debt and to assist the region in the management of regional debt. Relevance of this trend may increase in the near future due to the possible liberalization of state policies on regional external borrowing. The fact that after the 1998 crisis, some regions, published in foreign markets have experienced serious difficulties in servicing their obligations. After 1998, for the subjects of the Russian Federation were allowed only foreign loans to refinance old debt. However, new challenges of socio- economic development of the regions are forced to look for new sources of financing, including foreign ones.

Importance of establishing a special office or agency debt increases and due to the fact that Vnesheconombank - agent of the Government on management of external debt and foreign financial assets - will be converted and with Roseximbank and RBD forms a new Bank of the Russian Federation . Its main task will finance infrastructure and innovative projects, support for export and small businesses.

At the moment, the economy of Russia is stable. There are certain problems. In particular, the country's essential dependence on prices of raw material resources, a poorly diversified export, a lag of many branches of the economy behind the world's leaders. But it is impossible to say that the country risks encountering a new default in 2014. There is only a risk of a slight weakening of national currency and a small economic recession.

# Development of the Financial Markets in Turkey in Comparison with the EU Countries

Prof. Dr. Sudi Apak (Beykent University, Turkey)

Asst. Prof. Dr. Mehmet Fatih Bayramoğlu (Bülent Ecevit University, Turkey)

## Abstract

The Turkish financial sector, especially the Turkish banking sector, demonstrates a growth tendency in recent years. Although this growth is observed to be steady, it has not reached a sufficient volume and the sources of growth are not healthy. In this study, the dimensions of the said growth in the Turkish financial sector are analyzed in comparison with the EU member countries, which are also the members of OECD, with respect to the competitiveness features of the countries and financial centers, banking sectors of the countries and the capital markets of the countries. The study presents an evaluation of the current situation with a special focus on Istanbul - a city planned to be a global financial center.

## 1 Introduction

Banking sector constitutes the basic dynamics of growth in the financial sector of Turkey which has gained the tendency to grow after going through a difficult period of restructuring after the banking crises in 1999 and 2001. However, Turkey progressed slowly in capital markets and thus this sector lagged behind the banking sector. Conversely, with the stability gained in the economic and fiscal policies and the new regulations in the field of law such as the Turkish Commercial Code and the Capital Markets Law, the development of the Turkish financial sector has become more stable compared to past periods. These developments have been reflected positively on several reports, which are prepared on a global scale and compare certain countries or financial centers according to various criteria, in terms of Turkey in general and of Istanbul in particular.

However, since the basic dynamics of growth in the banking sector are based on consumer loans, credit cards and transaction fees rather than real sector and exports, continuity of the said growth and development in the sector is not guaranteed. Analysis of the sources of the developments in the capital markets demonstrates that especially the publicly traded banks, a small number of companies outside the financial sector and government debt instruments are effectual.

In the following sections of the present study, the developments in the Turkish financial sector will be presented in comparison with the EU member countries which are also the members of OECD. Section 2 is devoted to the comparison of the competitiveness features of the countries and financial centers, Section 3 is devoted to the comparison of the banking sectors of the countries and Section 4 presents the comparison of the capital markets of the countries.

## 2 Comparison of the Competitiveness Features of the Countries and Financial Centers

The course of the development of macroeconomic indicators of a country is parallel to the ease of doing business in that country. In this context, 185 countries were compared in terms of ease of doing business in the "Doing Business Report" published periodically by the World Bank (WB) and the International Finance Corporation (IFC). As seen in Table 1, when Turkey is compared with the EU countries included in the Report, it is observed that Denmark, United Kingdom and Finland occupied the first three ranks and that Turkey ranked 69th in the overall scoring and had a position higher than the positions of Greece, Romania and Czech Republic. Turkey needs to progress in terms of ease of doing business. It is obvious that Turkey has a potential in terms of ease of doing business when the positive developments in the Turkish economy, the improvements in the Turkish Commercial Code, incentives developed regularly in order to support domestic and foreign investors and the improvement and development investments in the infrastructure are considered (World Bank & IFC, 2014).

Another indicator that shows the development level of the countries in terms of global trade is the "Index of Economic Freedom" calculated and publicly announced by The Heritage Foundation. According to the Index, calculated within the scope of 181 countries by taking into consideration two basic variables as "Trade-Weighted Average Tariff Rate" and "Non-Tariff Barriers", Ireland, Denmark and United Kingdom occupied the first three ranks and Turkey ranked 64th in the overall scoring and had a position higher than the positions of Portugal, France, Italy and Greece (Heritage Foundation, 2014).

According to the Global Competitiveness Index announced annually by World Economic Forum, by the end of 2014, the most competitive countries were Finland, Germany and Sweden. Turkey ranked 44th in the overall scoring and had a position higher than the positions of Czech Republic, Italy, Portugal, Hungary, Romania, Slovakia and Greece (WEF, 2014).

| Doing Business | Rank | Economic Freedom | Rank | Global | Rank |
|---|---|---|---|---|---|
| Denmark | 5 | Ireland | 9 | Finland | 3 |
| United Kingdom | 10 | Denmark | 10 | Germany | 4 |
| Finland | 12 | United Kingdom | 14 | Sweden | 6 |
| Sweden | 14 | Netherlands | 15 | Netherlands | 8 |
| Ireland | 15 | Germany | 18 | United Kingdom | 10 |
| Germany | 21 | Finland | 19 | Denmark | 15 |
| Netherlands | 28 | Sweden | 20 | Austria | 16 |
| Austria | 30 | Austria | 24 | Belgium | 17 |
| Portugal | 31 | Czech Republic | 26 | France | 23 |
| Belgium | 36 | Belgium | 35 | Ireland | 28 |
| France | 38 | Spain | 49 | Spain | 35 |
| Poland | 45 | Poland | 50 | Poland | 42 |
| Slovakia | 49 | Hungary | 51 | Turkey | 44 |
| Spain | 52 | Slovakia | 57 | Czech Republic | 46 |
| Hungary | 54 | Romania | 62 | Italy | 49 |
| Italy | 65 | Turkey | 64 | Portugal | 51 |
| Turkey | 69 | Portugal | 69 | Hungary | 63 |
| Greece | 72 | France | 70 | Romania | 76 |
| Romania | 73 | Italy | 86 | Slovakia | 78 |
| Czech Republic | 75 | Greece | 119 | Greece | 91 |

***Table 1.*** *Competitiveness Features of the Countries According to the Results of Various Studies* ***Source:*** *World Bank & IFC, 2014; the Heritage Foundation, 2014; WEF, 2014.*

| Foreign Direct Investment to GDP (2011) | | | Venture Capital Availability (2011) | | |

| 50 | Germany | 1.13 | 57 | Hungary | 2.10 |
| 55 | Greece | 0.60 | 59 | Italy | 2.03 |
| 59 | Finland | 0.02 | 61 | Greece | 1.83 |

***Table 2.*** *Foreign Direct Investment and Venture Capital Availability Features of the Countries* ***Source:*** *WEF, 2012.*

While direct investments constitute a significant portion of the foreign capital inflow to Turkey, another major portion consists of portfolio investments. Portfolio investments which represent hot money are known to flow rather into closed economies. The main reason for this is the high return potential in money and capital markets. Therefore, high transaction volumes of foreign capital are observed both in interest-based instruments and instruments based on profit share.

In Table 2, the ratios of foreign direct investments of 62 selected countries to GDP are listed in the Financial Development Report published by World Economic Forum (WEF) in 2012. As can be seen in Table 2, the ratio of foreign direct investments to GDP in Turkey remained at a low level with 2.04 % by 2011. Among the selected countries, Belgium, Ireland and Denmark occupied the first three ranks and Turkey had a position higher than the positions of Netherlands, Spain, France, Romania, Italy, Germany, Greece and Finland, although this was lower than the expected ratio.

When the countries in Table 2 are evaluated in terms of venture capital availability, Sweden, Finland and the Netherlands occupied the first three ranks. Turkey, on the other hand, demonstrated a performance lower than the expected performance and ranked 43rd in the overall scoring. However, it is observed that the position of Turkey was higher than the positions of many EU Countries such as Spain, Romania, Czech Republic, Ireland, Poland, Portugal, Hungary, Italy and Greece.

It is observed in Table 3 that when the countries under investigation are evaluated on the basis of financial centers, there is a decline in the financial centers of the EU countries as of March 2012 according to the March 2011-March 2014 GFC Index. Vienna is observed to be the only EU member financial center that continued to rise steadily. Istanbul, on the other hand, is the only financial center that has risen steadily since March 2011.

*Table 3. Development Tendencies of the Financial Centers (March 2011-March 2014)* **Source: *GFCI, March 2011-2014.***

According to the March 2014 Report of GFCI and the grouping study conducted according to the connectivity, diversity and speciality/depth criteria, the global financial centers are Amsterdam, Frankfurt, London, Madrid and Milan. Istanbul, on the other hand, was evaluated as a transitional diversified financial center together with Vienna and outpaced many important financial centers such as Copenhagen, Edinburgh, and Stockholm.

It is seen that Istanbul obtained the positive results of planned work performed with the aim of becoming a financial center. It seems likely that in the future Istanbul will rise in the GFC Index and be one of the global financial centers.

## 3   Comparison of the Banking Sectors of the Countries

One of the leading indicators of the level of development in the banking sector is the ratio of the banking sector assets to GDP. The ratio of the banking sector assets to GDP is an indicator that provides information about the openness of the banking sector and reveals the weight of bank financing in the economy. As can be seen in Table 5, the ratios of the countries except Poland, Romania, Slovakia and Turkey are observed to be very high. These data show that the banking sector in Turkey still has a closed structure and the banks in Turkey has a role smaller than many EU countries in achieving GDP. This ratio, which is expected to be above 100%, is seen to reach this level only by the end of 2012 in Turkey.

| Year | AUT | BEL | CZE | DEN | FIN | FRA | GER | GRE | HUN | IRL | ITA | NL | POL | POR | RO | SVK | ESP | SWE | UK | TR |
|------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|----|-----|-----|-----|-----|-----|
| 2007 | 323 | 389 | 112 | 427 | 171 | 376 | 312 | 173 | 112 | 877 | 220 | 379 | 75 | 260 | 58 | 106 | 285 | 253 | 486 | 70 |
| 2008 | 375 | 370 | 106 | 467 | 215 | 396 | 318 | 194 | 120 | 962 | 236 | 374 | 72 | 280 | 60 | 101 | 313 | 272 | 481 | 66 |
| 2009 | 375 | 341 | 118 | 497 | 233 | 401 | 310 | 207 | 140 | 1024 | 247 | 388 | 88 | 309 | 74 | 89 | 328 | 322 | 572 | 85 |
| 2010 | 342 | 322 | 121 | 483 | 266 | 405 | 332 | 224 | 128 | 992 | 245 | 382 | 88 | 324 | 75 | 88 | 327 | 308 | 541 | 89 |

*Table 6.* *Various Indicators about the Banking Sector* **Source:** *Euro Banking Association, 2013.*
**Graph 2.** *Tier-1 Ratios of the Countries (%, 2011)* **Source:** *Euro Banking Association, 2013.*

One of the performance indicators of the banking sector is the ratio of loan to deposit. As seen in Graph 1, this ratio, which shows the ratio of the conversion of deposits to loans, is above 100% in all the countries except Belgium, Czech Republic, Germany, Slovakia and Turkey according to the data for the year 2011.

Table 6 presents the cost to income, RoE and Interbank Market Dependence data pertaining to the banking sectors of the countries as of 2011.

As can be seen in Table 6, a priority part of the Turkish banking sector revenue is derived from consumer credits, credit cards and annual dues, which are followed by credits given to SMEs. In addition, that the number of the banks is small helps the sector to be profitable. Switching of the current structure of the Turkish banking sector into an export-oriented banking system would significantly increase the contribution of the sector to GDP.

As can be seen in Graph 2, the Turkish banking sector has a very high percentage with 13.82% (end of the year 2011) in terms of Core Capital Ratio (Tier-1). Taking into consideration that the lowest acceptable level for this ratio is 8%, it is seen that the banking industry has a solid capital structure. In the Turkish banking sector, by means of the ongoing Banking Regulation and Supervision Agency (BRSA) practice aimed at limiting profit distribution and keeping profits in the body, formation of reserve fund nearly twice the total paid-in capital was achieved and the strong capital structure of the sector was preserved. In the Tier-1 Ratio ranking in the Financial Development Report published by World Economic Forum (WEF) in 2012, Turkey ranked 18th among 59 countries and outpaced many developed countries. Among the countries examined in the present study, Turkey ranked 4th after Ireland, Denmark and the Netherlands. The Banking Regulation and Supervision Board reported that this ratio is 16% for the Turkish Banking Sector as of June 2012 (World Economic Forum, 2012).

| Ease of Access to Credit | | | Ease of Access to Loans | | |
|---|---|---|---|---|---|
| Rank | Country | % | Rank | Country | % |
| 4 | Finland | 4.77 | 3 | Sweden | 4.56 |
| 9 | Sweden | 4.58 | 8 | Finland | 4.41 |
| 15 | Turkey | 4.25 | 13 | Belgium | 3.78 |

| 27 | Austria | 3.99 | 25 | Austria | 3.21 |
| 32 | Slovak Republic | 3.75 | 26 | Germany | 3.17 |
| 33 | Belgium | 3.74 | 29 | United Kingdom | 3.14 |
| 36 | United Kingdom | 3.60 | 34 | Denmark | 3.09 |
| 38 | Netherlands | 3.55 | 36 | Slovak Republic | 2.98 |
| 39 | Poland | 3.46 | 38 | France | 2.97 |
| 42 | Denmark | 3.34 | 39 | Turkey | 2.97 |
| 45 | Czech Republic | 3.29 | 41 | Czech Republic | 2.88 |
| 51 | Romania | 3.08 | 42 | Romania | 2.70 |
| 53 | Italy | 2.94 | 46 | Poland | 2.55 |
| 54 | France | 2.93 | 52 | Portugal | 2.30 |
| 57 | Hungary | 2.61 | 54 | Hungary | 2.25 |
| 58 | Portugal | 2.37 | 57 | Spain | 2.05 |
| 60 | Ireland | 2.28 | 59 | Italy | 1.98 |
| 61 | Spain | 1.97 | 60 | Ireland | 1.83 |
| 62 | Greece | 1.72 | 61 | Greece | 1.71 |

**Table 7.** *Ranking of the Ease of Application and Access to Credit in the Countries (2011)* **Source:** *WEF, 2012.*

The Financial Development Report published by World Economic Forum (WEF) in 2012 also includes a survey on the ease of access to credit and loans in the banking sectors of 62 countries.

According to this report, while the process of access to credit is easy in Turkey, access to loans is at a low level. Most successful countries in terms of ease of access to credit and loans were Finland and Sweden (World Economic Forum, 2012). These results indicate that there are successful investments concerning SMEs and foreign investors in the respective countries and that there are no deposit deficits in these countries.

Graph 3 presents the employment data in the banking sectors of the countries as of 2011. When these data are evaluated, it becomes noteworthy that banking sector has high employment levels for Germany, United Kingdom, France and Italy. This group is followed by Spain, Turkey, Poland and the Netherlands respectively.

**Graph 3.** *Level of Employment in the Banking Sector by Country* **Source:** *Euro Banking Association, 2013.*

Table 8 shows the data of the countries concerning the number of Commercial Bank Branches, Debit Card Penetration and Total Number of ATMs per 100,000 adults. It is observed that Turkey is at low levels in terms of the three parameters and hence has a development potential.

According to this report, Turkish banking sector ranks 28th in terms of the number of branches, 23rd in terms of the debit card number and 38th in terms of the number of ATMs (World Economic Forum, 2012). The reasons that cause Turkey to remain at low levels in these rankings can be formulated as follows: the population of Turkey is higher than most of the countries under investigation, the number of the banks operating in Turkey is relatively low and statistics show that the banking sector is switching to internet banking.

| \multicolumn{3}{c}{Commercial Bank Branches} | | | \multicolumn{3}{c}{Debit Card Penetration} | | | \multicolumn{3}{c}{Total Number of ATM's} | | |

## 4 Comparison of the Capital Markets of the Countries

According to the data from the World Federation of Exchange, the number of the shares traded in the main markets of the stock markets in 2012 decreased compared to 2011. It is observed that this change, which is shown in Table 9, does not apply only to Germany. A 14% decrease in the total number of shares traded occurred also in Borsa Istanbul.

| Exchange Name | 2011 | | | 2012 | | |
|---|---|---|---|---|---|---|
| | Domestic | Foreign | Total | Domestic | Foreign | Total |
| BME Spanish Exchanges | 3,241 | 35 | **3,276** | 3,167 | 33 | **3,200** |
| NYSE Euronext (Europe) | 969 | 143 | **1,112** | 939 | 134 | **1,073** |
| Deutsche Börse | 670 | 76 | **746** | 665 | 82 | **747** |
| Athens Exchange | 269 | 3 | **272** | 262 | 3 | **265** |
| Borsa Istanbul | 263 | 1 | **264** | 226 | 1 | **227** |
| Wiener Börse | 88 | 17 | **105** | 84 | 15 | **99** |
| Budapest SE | 52 | 2 | **54** | 51 | 1 | **52** |
| Irish SE | 48 | 7 | **55** | 42 | 8 | **50** |
| **Total** | **5,600** | **284** | **5,884** | **5,436** | **277** | **5,713** |

*Table 9. The Number of Shares Traded in Exchanges (2011-2012)* **Source:** *World Federation of Exchange, 2013.*

When the exchanges are classified as domestic and foreign, it is observed that BME Spanish Exchange, NYSE Euronext, Deutsche Börse and Wiener Börse are the ones where foreign companies are also traded.

When the "stock market turnover ratios" of the exchanges of the countries in Table 10 are evaluated, it is seen that many countries and primarily Turkey have high ratios and hence the speed of changing hands of shares in these exchanges is considerably high.

When Table 10 is evaluated in terms of "Stock Market Capitalization to GDP", it is seen that the capital markets with the highest contribution to the GDP of their countries are United Kingdom, Sweden and Spain. Although Turkey ranks 42nd in the overall ranking, it has outpaced many of the EU countries.

| Stock Market Turnover Ratio | | | Stock Market Capitalization to GDP | | |
|---|---|---|---|---|---|
| Rank | Country | Value | Rank | Country | Value |
| 1 | Turkey | 237.86 | 7 | United Kingdom | 129.95 |
| 3 | Italy | 191.19 | 11 | Sweden | 111.98 |
| 10 | Spain | 128.63 | 16 | Spain | 85.97 |
| 11 | Hungary | 123.27 | 20 | Netherlands | 76.34 |
| 13 | United Kingdom | 117.62 | 22 | France | 74.65 |
| 14 | Germany | 114.95 | 27 | Denmark | 66 |
| 17 | Finland | 109.58 | 33 | Belgium | 55.56 |
| 18 | Netherlands | 108.16 | 34 | Finland | 43.11 |
| 21 | Sweden | 91.67 | 35 | Germany | 40.57 |
| 24 | Austria | 89.07 | 40 | Portugal | 38.66 |
| 25 | France | 83.13 | 42 | Turkey | 37.12 |
| 26 | Greece | 81.25 | 44 | Poland | 35.16 |
| 28 | Denmark | 77.94 | 45 | Czech Republic | 24.34 |
| 36 | Ireland | 58.25 | 46 | Hungary | 21.69 |
| 37 | Poland | 54.03 | 48 | Greece | 20.79 |
| 39 | Belgium | 47.55 | 51 | Romania | 19.09 |
| 41 | Portugal | 38.72 | 53 | Austria | 15.71 |
| 42 | Czech Republic | 33.66 | 54 | Italy | 15.17 |
| 53 | Romania | 7.45 | 55 | Ireland | 15.1 |
| 58 | Slovakia | 4.65 | 59 | Slovakia | 4.94 |

*Table 10. Stock Market Turnover Ratio ve Stock Market Capitalization to GDP Ratios of the Exchanges (2011)*
*Source: WEF, 2012.*

When the Bond Markets-GDP relationship of the exchanges of the countries in Table 11 is analyzed, it is seen that the contribution of the Private Domestic Bonds of Denmark and Ireland to GDP is high and that Turkey is at a rather low level. The reason underlying this situation is that in Turkey the private sector cannot compete with the public sector due to high rates of inflation and that the number of the companies that are able to issue bonds is considerably small. Therefore, the financing of the private sector in Turkey is realized through the banking sector.

| Private Domestic Bond | | | Public Domestic Bond | | | Private International Bonds | | | Public International Bonds | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Rank | Country | Value | Rank | Country | Value | Rank | Country | Value | Rank | Country | Value |
| 1 | Denmark | 177.0 | 2 | Italy | 88.6 | 1 | Ireland | 203.0 | 1 | Greece | 70.8 |
| 2 | Ireland | 109.0 | 5 | France | 61.3 | 2 | Netherlands | 163.0 | 3 | Belgium | 29.8 |
| 4 | Netherlands | 69.5 | 6 | United | 58.3 | 3 | United | 124.0 | 4 | Ireland | 26.7 |
| 5 | Portugal | 67.3 | 7 | Belgium | 57.2 | 4 | Spain | 109.0 | 5 | Finland | 26.7 |

| 36 | Poland | 2.0 | 36 | Slovakia | 20.8 | 50 | Poland | 1.2 | 29 | Netherlands | 3.4 |
| 40 | Turkey | 0.6 | 42 | Finland | 11.9 | 54 | Slovakia | 0.5 | 33 | Romania | 2.6 |
| 42 | Romania | 0 | 46 | Romania | 6.4 | 56 | Romania | 0 | 35 | France | 2.3 |

*Table 11. Relationship between Bond Markets and GDP (2011)* **Source:** *WEF, 2012.*

When the Public Domestic Bond Market Capitalization to GDP Relationship as demonstrated in Table 11 is analyzed, it is seen that the contribution of the Public Domestic Bonds of Italy and France to GDP is high and that Turkey ranked 29th, which is a relatively high level due to fact that Turkey is a country that takes on debt through the public sector.

It is observed that Ireland and the Netherlands ranked high in terms of Private International Bonds to GDP while Turkey ranked rather low in this category.

In terms of International Bonds to GDP, Greece, which realizes public borrowing in international markets, is observed to have a high ratio while Turkey ranked 23rd, which is a relatively high ranking.

## 5  Conclusion

Turkish financial sector tends to grow in recent years. Although this growth is observed to be steady, it has not reached a sufficient volume and the sources of growth are not healthy.

That there are banks in the Turkish sector which operate in foreign countries is significant in terms of transferring resources from these countries to Turkey. For this purpose, increasing the number of branches in foreign countries should be immediately ensured by the establishment of new banks or by entering into partnership with foreign banks. Growth of volume can be achieved by transferring deposits obtained from abroad to Turkey. However, the existing banking structure in Turkey prevents the use of these opportunities. Therefore, the obstacles to the sector are required to be removed.

That the Turkish banking sector has a structure that is oriented rather towards individual consumers; that adequate and cost-effective resources cannot be fully provided for SMEs; and that SMEs face many obstacles in issuing bonds to form their own funding sources reveal a banking structure that does not overlap with the objectives of the development of the sectors in Turkey in general and with the specific objective of the development of Istanbul to become an international financial center. The Turkish banking sector has a structure that increases its profitability by deriving huge income from consumer credits, credit cards and annual dues. Changing the closed structure of the Turkish banking sector and establishing an export-oriented banking system is of great importance.

Capital markets in Turkey are observed to rank low in terms of the number of shares traded and market capitalization. It is required to implement the actions determined in order to improve the exchange, which acquired a modern structure with the establishment of Borsa Istanbul in the last two years, and to ensure that Borsa Istanbul has a competitive structure.

A further evaluation with respect to capital markets can be made for bond markets. Borsa Istanbul should support the issuance of the debt instrument of the private sector. Taking into consideration that bond issuance of the private sector depends on the decrease of the interest rates and the reduction of the borrowing of the public sector by bond issuance, reducing interest rates and the gradual withdrawal of the public sector from the bond market is important.

# Artificial Neural Network Models to Build an Early Warning System for Turkish Commercial Banks before and after the 2001 Financial Crisis

Prof. Dr. Süleyman Bilgin Kılıç (Çukurova University, Turkey)
Assoc. Prof. Dr. Kenan Lopcu (Çukurova University, Turkey)
Asst. Prof. Dr. Semin Paksoy (Çukurova University, Turkey)

## Abstract

The objective of this paper is to measure the failure risk of Turkish commercial banks. Bank failures bring to bear high costs on economies as well as on governments and eventually on the public and the taxpayers. During the past two decades, many developed and developing economies have experienced large scale bank failures, and estimates for average bank restructuring costs range from 6% to 10% of the Gross Domestic Product. In Turkey the amount of restructuring costs is approximately 30% of the Gross Domestic Product. In this study, we use 29 selected financial ratios of banks across 1996-2012 periods and the Artificial Neural Network Models to build an early warning system. If commercial bank failure were a predictable event, bank restructuring costs could be minimized. Additionally, if early warning systems are used effectively, the regulatory actions necessary to prevent banks from failing could be taken in advance or in the least a more orderly process of bank closures could be administered. The results overall indicate that almost all commercial banks currently operating in the Turkish banking sector are quite sound and far from failure.

## 1 Introduction

Bank failures bring to bear high costs on economies as well as on governments, and eventually on the public and the taxpayers. During the past two decades, many developed and developing economies in the world have experienced large scale bank failures, and the estimates for (international) average bank restructuring costs range from 6% to 10% of Gross Domestic Product (GDP) (Hutchison and McDill, 1999). In Turkey this amount is approximately 30% of the GDP (Kılıç, 2003). Obviously, if bank failure were a predictable event, bank restructuring costs could be minimized. If early warning systems are used effectively in bank supervision, the regulatory actions necessary to prevent banks from failing can be taken in advance or a more orderly process of bank closures can be administered.

Early bank failure studies employed multivariate statistical analyses, including regression analysis. For example, Meyer and Pifer (1970), and Rose and Kolari (1985) used discriminant models; Sinkey (1975) used logit models; Cole and Gunther (1998), and Pantolone and Platt (1987) used probit models.

Recent important studies conducted toward investigating causes of great bank failures in the Unided States. Cebula, et al. (2011) investigated the factors that systematically influence bank failures, including major federal government banking statutes that are implemented over the period 1970 through 2009, with emphasis on two major banking statutes, the Federal Deposit Insurance Corporation Improvement Act of 1991 FDICIA and the RNIBA. Over the study period, their evidence strongly implies that FDICIA acted to reduce bank failures whereas Riegle-Neal Interstate Banking and Branching Efficiency Act of 1994 RNIBA (presumably by increasing competition and/or increasing costs through branch bank expansion) induced a net increase in bank failures in the U.S. Jin et al. (2011) examined the ability of selected accounting and audit quality variables measured in a period prior to the financial crisis (i.e., the four quarters of 2006), to predict banks that subsequently failed during the financial crisis. They employed two sets of samples from the US: a troubled banks sample that includes banks that failed in or after 2007 as well as banks classified as being troubled based on profitability, loan quality, and balance sheet position in 2007, and a full sample that includes all banks with available required data. Using the troubled banks sample, they identified the following ten predictors of bank failure: auditor type, Tier 1 capital ratio, proportion of securitized loans, nonperforming loans, loan loss provisions, growth in commercial loans, growth in real estate loans, growth in overall loans, loan mix, and whether the bank is a public bank. Following this study, Jin et al. (2013) studied the impact of the FDICIA on banks' risk-taking behavior prior to the recent financial crisis and the consequent implications for bank failure and financial trouble during the crisis period. The study provided evidence that banks required to comply with the FDICIA internal control requirements have lower risk taking in the pre-crisis period. Specifically, the volatility of net interest margin, the volatility of earnings, and Z score show less risk-taking behavior. Furthermore, these banks are less likely to experience failure and financial trouble during the crisis period. Fatima and Silvia (2013) used survival analysis to determine how early the indications of bank failure can be observed. They find that banks with high loan to asset and high personal loan to assets ratios are more likely to survive. Older banks and banks with high real estate and agricultural loans, loan loss allowance, loan charges off

and non-performing loans to assets ratio are more likely to fail. It is possible to predict survival functions of <50% for failed banks, 3 years or less before failure.

Some other recent important studies conducted toward investigating causes of bank failures in other countries and regions. Arena (2008) used bank-level data from recent banking crises in East Asia and Latin America to address the following two questions: (1) To what extent did individual bank conditions explain the failures? (2) In terms of their fundamentals, was it mainly the weak banks ex ante that failed in the crisis countries? The results of the study showed that for the two regions, bank-level fundamentals significantly affect the likelihood of collapse for these banks; systemic shocks (both macroeconomic and liquidity) that triggered the crises mainly destabilized the weak banks ex ante, particularly in East Asia. Brown and Dinç (2011) studied bank failures in twenty-one emerging market countries in the 1990s. By using a competing risk hazard model for bank survival, they show that a government is less likely to take over or close a failing bank if the banking system is weak. They also show that the Too-Many-to-Fail effect is stronger for larger banks and when there is a large government budget deficit. Huang et al. (2012) evaluated data from 858 international banks (including banking holding companies) from 2005 to 2008 and applies a logistic model to analyze critical factors. They showed that equity-to-assets (ETA) and interest income - interest expense/income (NIN) had negative relationships with financial distress. They stated that ETA and NIN were indicative of banking financial distress and best predicted trends in Association of Southeast Asian Nations and European Union banks. Fungáčová and Weill (2013) investigate the role of bank competition on the occurrence of bank failures by analysing a large sample of Russian banks for the period 2001-2007, as an example of an emerging market, and find that tighter bank competition enhances the occurrence of bank failures; increase bank competition could undermine financial stability.

Some studies combine the nonparametric approaches with the parametric multivariate statistical methods including discriminant or logit analysis for bank failure prediction. For example, Tam and Kiang (1992) introduce the neural network approach to perform discriminant analysis as a promising method of evaluating banking conditions. Jo and Han (1996) suggest an integrated model approach for bankruptcy prediction using discriminant analysis and two artificial intelligence models, namely, neural network and case-based forecasting, and conclude that the integrated models have higher prediction accuracy than individual models. Alam, Booth and Thordarson (2000) state that fuzzy clustering algorithm and self-organizing neural networks provide valuable information to identify potentially failing banks. Kolari et al. (2002) use both parametric logit analysis and the nonparametric trait approach to develop computer-based early warning systems to identify large bank failures, and conclude that the system provides valuable information about the future viability of large banks. Lam and Moy (2002) combine several discriminant methods and perform simulation analysis to enhance the accuracy of results for classification problems in discriminant analysis. Zhao et al. (2009) empirically compared the performance of two sets of classifiers for bank failure prediction; one built using raw accounting variables and the other built using constructed financial ratios. They used four popular data mining methods to learn the classifiers: logistic regression, decision tree, neural network, and k-nearest neighbor. The results of the study indicated that feature construction, guided by domain knowledge, significantly improves classifier performance and that the degree of improvement varies significantly across the methods. Chauhan et al. (2009) were proposed differential evolution algorithm (DE) to train a wavelet neural network (WNN). They named resulting network as differential evolution trained wavelet neural network (DEWNN) and tested the efficacy of DEWNN on bankruptcy prediction datasets of US banks, Turkish banks and Spanish banks. By employing 10-fold cross validation method, they concluded that DEWNN outperformed the original WNN in terms of accuracy and sensitivity across all problems.

Kılıç (2003), and Canbaş et al. (2005) combined Principal Component analysis (PCA) with discriminant, logit and probit models to develop an Integrated Early Warning System for predicting bank failure one year in advance in the Turkish banking sector. More recently, Shin and Kılıç (2006) used PCA-based neural network committee model for early warning of bank failure and also, Shin et al. (2006) used ensemble prediction of bank failure through diversification of input features. Lopcu and Kılıç (2012) used PCA and the logit model to build and early warning system to predict the out of sample failure probabilities of the Turkish commercial banks. Boyacioglu et al. (2009) aimed to apply various neural network techniques, support vector machines and multivariate statistical methods to the bank failure prediction in Turkey. Twenty financial ratios with six feature groups including capital adequacy, asset quality, management quality, earnings, liquidity and sensitivity to market risk (CAMELS) are selected as predictor variables in the study. In the category of neural networks, they employed four different architectures namely multi-layer perceptron, competitive learning, self-organizing map and learning vector quantization. In the category of multivariate statistical methods; they tested multivariate discriminant analysis, k-means cluster analysis and logistic regression analysis. Results of the study showed that multi-layer perceptron and learning vector quantization can be considered as the most successful models in predicting the financial failure of banks. Penas, and Tümer (2010) explored whether Turkish banks with worsening indicators of financial fragility were subject to market monitoring during the years leading to the 2000/2001 crisis, and how the quality and timeliness of the disclosure affect market reaction. They found that

shareholders reacted negatively to indicators of financial fragility and suggested that securities prices react to financial fragility indicators should not be taken as sufficient evidence of banks' safety and soundness. Erdal and Ekinci (2013) presented a comparison of three different artificial intelligence methods, namely support vector machines (SVMs), radial basis function neural network (RBF-NN) and multilayer perceptions (MLPs); in addition to subjecting the explanatory variables to principal component analysis (PCA). The extent of this study encompasses 37 privately owned commercial banks (17 failed, 20 non-failed) that were operating in Turkey for the period of 1997-2001. They concluded that, (i) PCA does not appear to be an effective method with respect to the improvement of predictive power; (ii) SVMs and RBF demonstrated similar levels of predictive power; albeit SVMs was found to be the best model in terms of total predictive power; (iii) MLPs method stood out among the SVMs and RBF methods in a negative sense and exhibits the lowest predictive power.

In this current study, as a follow up to the study by Canbaş et al.(2005) and Lopcu and Kılıç (2012), an expanded data set of commercial banks are pooled and Artificial Neural Network (ANN) Models developed to build an early warning system for 1996-2000 and 2002-1012 periods to predict bank failures as many as 7 years in advance. In particular, representing the banks by a dummy dependent variable $y_{bt}$, we assign the value of 1 from 1996 on, for the banks that have failed in year $t$, and exclude them from the analysis after the year failure has been announced.

Bank failures can be considered as a continuous process in time, although failure is recorded at a specific point in time. We maintain that failure is mainly due to continuously worsening financial conditions attributable to a bank's misguided internal management policies over a number of years. Financial ratios provide valuable quantitative information about changes in financial conditions of banks. Decision makers should examine banks over time to capture information about the progress towards the failure.

The major contribution of this study to the literature is the use of information provided by financial ratios that differ significantly in means between the failed and non-failed group of banks and comparison of Turkish commercial banks' performance before and after 2001 financial crises. 2001 was the year of financial and economic crises in Turkey. Starting on February 21, 2001 Turkish lira lost it value sharply, interest rates sky-rocketed, and inflation started to soar. The Turkish GDP was also reduced significantly in the same year. As part of a larger economic reform package following the crisis, banking sector as well was reorganized. It is worth noting that of the 22 failed banks included in our data set 14 failed during the period between the recent months of 2000 and July 2003 (Table 3).

*Table 1. Financial ratios used in the study*

In this study, we use 29 financial ratios published by the Banks Association of Turkey (BAT) and given in Table 1 to build ANN models for the pre and post 2001 periods to predict the bank failures in advance. We test

the mean equivalence of the ratios for failed and non-failed banks via ANOVA tests, and use only the financial ratios, which has significantly different means as inputs in the ANN models. The use of significantly different financial ratios provides more refined and enhanced information to the decision makers than the direct use of all available financial ratios.

The rest of this article is organized as follows: Section 2 reports the methodology and results, including the sample and variable selection; the determination of significant financial ratios; and the estimation and interpretation of the results from the ANN models. Then, section 3 concludes the article.

## 2 Data Methodology and Results

### 2.1 Data, Sample and Variable Selection

The sample set covers all commercial banks in the Turkish banking sector for the period of 1996-20012. The number of banks in the sector changes from year to year because of mergers, buyouts and failures. The maximum number included in the analysis is 46 for 1997(Table 3), including 22 banks that had failed between 1997 and 2003. Currently 26 commercial banks operate in the Turkish banking sector (Table 4). In 1999 and 2000 the BAT published 49 financial ratios annually for each bank operated in the Turkish banking sector, including the banks whose failure had been announced and eventually transferred to the Savings Deposits Insurance Fund (SDIF). Although, the ratios published starts from 1992, many of the ratios for a number of banks are missing for the initial years and become more regular after 1996.

Starting with 2002 the BAT began to publish 66 annual ratios for each bank. The ratios before and after 2001 are not consistent in term of number of the banks operating in the industry, and the ratios published for each bank. However, 29 ratios for each bank are compatible both in the data published prior to 2001 and after 2001 (Table 1). Thus, our data set includes 29 common annual ratios and covers the period 1996 to 2012, with the exception of 2001. Of the 22 failed banks included in our data set,14 failed during the period between the recent months of 2000 and July 2003 (Table 3).

All the branch and activity ratios in current TL are converted to 2005 TL using the revaluation index according to tax procedure laws. Though, none of these ratios turns out to be significant in the ANOVA, except net income per branch (R26). Using CPI and PPI from the OECD data base for Turkey to convert these ratios to 2005 TL produces similar results.

Using the uni-variate analysis of variance (ANOVA), we determine the most relevant financial ratios for the bank failures. The null hypothesis in ANOVA is that the means of the failed and non-failed banks are equal for a given ratio. According to the results of the ANOVA tests, 11 ratios (R2-R9, R13, R18 and R26) out of 29 emerge as statistically significant at 1 % level. These are the most relevant financial ratios that have high discriminating ability for the two groups of failed versus non-failed banks.

In order to compare the financial performance of commercial banks before and after 2001, we build an ANN model for each of the sub-periods of 1996-2000 and 2002-2012. However, data for the period of 2002-2012 include no failed banks. So, we combine the ratios of failed banks from the period of 1996-2000 with the ratios of 2002-2012 nonfailed banks to be able to build an ANN model for the post 2001 period.

### 2.2 Estimation of the ANN Models

We partition dataset for each of the ANN model we built (1996-2000 and 2002-1012 periods) into the training and testing samples by randomly assigning 70% data to the training sample and the rest (30%) to the testing sample. The training sample data, used to train the neural network as certain percentage of observations in the dataset must be assigned to the training sample in order to build a model. The testing sample is comprised of an independent set of observations used to keep track of errors during training to prevent overtraining. Network training is generally the most efficient if the testing sample is smaller than the training sample. So, we assign circa 30% of the observations to the testing sample.

We directly use 11 significant ratios as inputs to the ANN models. The outputs of the models are actual status of the banks which is either 0 (for non-failed bank) or 1 (for failed bank). After so many experiment we trained two ANN models. The architecture of ANN model for the period of 1996-2000, which consists of 1 input layers (11 significant ratios denoted by $R_i$, $i=1,2,,...,11$), 1 hidden layer with 7 nodes and 1 output layer with 2 nodes. The model for the period of 2002-2012 consists of 1 hidden layer again, but includes 9 hidden nodes. For the sake of conserving space we do not present the figure describing the model architecture for 2002-2012 and the parameter estimates (weights) for both ANN models.

The ANN models trained as follows;

Let $R_i$ ($i=1,…,11.$) denote 11 significant financial ratios which are used as input in the input layer; $i$, $j$ and $k$ represent input, hidden and output layers; $n$, $m$ and $p$ indicate number of nodes in input, hidden and output layers respectively. Each hidden node $j$ produce an output by using following logit (sigmoid) activation function $f(x_j)$ which uses the weighted sum of the inputs $R_i$ from the input layer;

$$f(x_j) = 1/(1+e^{-z_j}), \ \ z_j = \sum_{i=1}^{n} w_{ij} R_i, \ j=1,...,m.$$

Here, wij is connection weights from input node i to hidden node j. The outputs from the hidden layer nodes are the inputs of the output layer nodes. Also, each output node k produce an output by using following sigmoid activation function f (xk) which uses the weighted sum of the inputs f (xj) from the nodes of hidden layer;

$$y' = f(x_k) = 1/(1 + e^{-z_k}), \ z_k = \sum_{j=1}^{m} w_{jk} f(x_j), \ k = 1, ..., p.$$

Here, y' denotes predicted value of the ANN model (0≤y'≤1), wjk is connection weights from hidden node j to output node k. Hence, the prediction error (εt = yt - y't) is the difference between the actual status (yt) which is either 0 (for non-failed bank) or 1 (for failed bank), and predicted failure probability value ($y'_t$) for bank t.

Hence, the total prediction error function of ANN given the training sample size of *N* is;

$$S(w) = \sum_{t=1}^{N} \varepsilon_t$$

Values of the all weights ($w_{ij}$, $w_{jk}$) in the ANN model were determined by the following estimation algorithm:

All weights were assigned with random values initially and modified by the gradient descent algorithm according to the gradient vector of the total prediction error function;

$$w_{new} = w_{old} + \alpha \nabla E(w)\big|_{w_{old}}, \ \nabla E(w) = (\partial S(w)/\partial w)$$

Here, $\alpha$ is the learning parameter (0≤$\alpha$ ≤1), and taken as $\alpha$=0.0001 in this study. Iterations eventually terminated at a local minimum of the total prediction error function when $w_{new} \cong w_{old}$.

## 2.3 Results

We present the summary of the classification results for the ANN models in Tables 2. Given the limitations in data, such as starting with a limited number of ratios and not including 2001 in the analysis when 9 of the failures were announced, and assigning $y_{bt}$ the value of 1 not only in year *t* when the failure was announced but as many as 7 years in advance, we interpret these results as the models having a very high predictive power, especially for the 2002-2012 period.

| Classification results: 1996-2000 | | | | Classification results: 2002-2012 | | | | |
|---|---|---|---|---|---|---|---|---|
| **1996-2000** | | **Predicted** | | | | **Predicted** | | |
| **Training** | **Observed** | **0** | **1** | **% Correct** | **Training** | **Observed** | **0** | **1** | **% Correct** |

| Testing Percentage | | 55,4 | 44,6 | 87,7 | Testing Percentage | | 79,7 | 20,3 | 98,3 |

***Table 2.** Classification results*

In particular, 60 of 72 failures in the training sample and 24 of 27 failures in the testing sample are predicted accurately for the 1996-2000 period. For the 2002-2012 period on the other hand, all the non-fail and fail cases are predicted accurately with 99.6% and 98.3% for the training and testing samples respectively. It can argued that predicting failures accurately is more important because, as stated previously, the international average for bank failure costs was estimated to be 6 to 10% of GDP, prior to the recent global turmoil in the financial markets started in 2008. If a bank failure is predicted in advance, the cost of the failure can at least be minimized, even if it cannot be completely eliminated.

Tables 3 and 4 present the estimated failure probabilities for each bank and the year in the sample. Overall the performance of the Turkish commercial banks appears to be much better in the post 2001 period and they are far from the risk of failure. The last row in Table 3 and the last row of the lower panel in Table 4 give the average of predicted failure probabilities for the periods before and after 2001, accordingly. In particular, the highest average failure probability in the post 2001 period is in 2002, immediately following the financial and economic crisis in Turkey and is equal to 10%. However, even this high of a failure probability is lower than the smallest average failure probability of non-failed banks of 11.8% in1998-1999 in the pre 2001 period. Starting with 2003, the average failure probabilities decline sharply followed by a slight increase (4.5%) in the wave of global financial crisis in 2007 and become nearly zero in 2009, 2011 and 2012.

***Table 4.** Predicted failure probabilities for 2002-2012*

Figure 1 below based on the Tables 3 and 4, illustrates this sharp decline in the average probability of failures predicted by the ANN models. Economic and financial measures that were undertaken after 2001 crisis, which in part were designed to better scrutinize the financial system and specifically banks, seem to be paying off. Despite the deterioration of macroeconomic conditions in Turkey, in term of growth, unemployment, inflation, difficulties in the export markets, a global financial crisis shaking the World, and a relatively unstable political environment in recent years, the Turkish commercial banks appear to be quite far from the risk of failure.

**Figure 1.** *Average probabilities of failures by years*

## 3  Concluding Remarks

Economic conditions also appear to affect the probability of bank failures. Banking crises happen when the macroeconomic environment is weak, particularly when growth is low and inflation is high. In addition, high real interest rates are in general associated with systemic problems of the banking sector (Demirgüç-Kunt and Detragiache, 1998). The moral hazard problem (financial liberalization combined with explicit deposit insurance and weak law enforcement) also increase the failure probabilities (Hutchison and McDill, 1999).

All of the above macroeconomic problems were observed in Turkey during the period of 1992-2013 to various degrees, contributing to the failure of 26 banks between 1994 and 2003. There is no doubt that the adverse macroeconomic conditions contributed to the bank failures in Turkey. However, no banks failed in Turkey after 2003, despite the global financial crises and the failures experienced by some of the prominent players of the global financial system. It can be argued that the adverse macroeconomic conditions and the unfavorable global financial environment have increased the probability of bank failures. Nevertheless, the non-failed banks in Turkey have survived in contrast to the group that failed under the same adverse macroeconomic conditions and financial environment. Hence, this study underlines two important factors unequivocally contributing to bank failures: 1) internal conditions resulting from a bank's own mismanagement and misguided policies; and 2) the failure of monitoring agencies to warn the banks and to take under close examination of those with high potential to fail. Measures that were undertaken after 2001 crisis to better scrutinize the financial system and banks, seem to be paying off.

After the 2001 crisis, Turkey started to apply a transition program toward to the stronger economy in February 2001. Within this program, restructuring of Turkish banking sector had been started and applied in the period of 2002-2007. Important changes and arrangements were made in the banking laws and regulations in order to harmonize with the international standards and applications. So, banking regulation and supervising agency became more effective in monitoring and supervising of banks. Results of this study strongly support the positive effects of these regulations on Turkish banking sector after 2001 (Figure 1). Hence, if decision makers monitor banks over time, they can capture a significant amount of information about the changes in financial condition of banks. Using financial ratios that have significantly different means for failed and non-failed group of banks provides more refined and enhanced information to decision makers than using all financial ratios directly. As such, they can become part of the early warning toolkit available to internal management and bank supervising agencies.

A cursory examination of recent bank failures in the United States suggests that similar factors may have played a role in the wave of fresh bank failures. Future research can further scrutinize whether these findings hold true for other countries.

# Comparative Analysis of Efficiency Measurement of Banks in the Turkish Banking System

Asst. Prof. Dr. Ebru Esendemirli (Yaşar University, Turkey)
Asst. Prof. Dr. Emine Yasemin Yeğinboy (Dokuz Eylül University, Turkey)

## Abstract

The global developments at the beginning of 21st century raised different issues about the banking sector. International banks are being effective since 2001 in emerging markets while U.S. banking sector is dealing with the consequences of the crisis in 2008. Furthermore the flow of funds from developed countries to emerging markets had an increasing trend due to the globalization of the capital markets. Banks have a major role in Turkish financial system. The aim of this study is to measure and compare the efficiency of banks in Turkish banking industry. The first part of the study reports a descriptive summary about the general appearance of the Turkish banking system. The second part of the study discusses the theoretical aspects in measuring the efficiency of banks. In the third part of the study, a non-parametric method, data envelopment analysis is used to analyze the efficiency of foreign banks, private banks and participation banks. As a result the average efficiency score of foreign banks in 2008-2012 is slightly higher than the average efficiency of participation banks. Although there isn't a very large difference, foreign banks and participation banks are more efficient than private banks.

## 1  Introduction

In the last decade both emerging markets and developed countries were exposed to financial crisis. For instance in countries like Turkey and United States supporting financial liberalization with incompetent regulation and supervision provided the ground for crisis. Banking sector one of the key players of financial markets is going through a rapid change due to the global effects of crisis. In February 2001 a banking crisis broke out in Turkish economy due to structural problems like unsustainable amount of internal debt stock, high inflation rate, fragilities in Turkish banking sector and ambiguities in political environment. As a result 22 banks were transferred to Savings Deposit Insurance Fund (SDIF) with a restructuring cost of USD 53.6 billion (BRSA, 2010). After the crisis structural reforms were put into action to maintain economic and financial stability. The financial reforms covered; (i) solving the financial problems of banks under SDIF control, (ii) restructuring the state owned banks, (iii) strengthening the capital of private banks through mergers and share transfers and (iv) adopting legislative measures (BAT, 2009b). Following the crisis and the financial reforms, the total assets rose from USD 130 billion to nearly USD 800 billion during the period of 2002-2014 (BRSA, 2014c).

United States was exposed to financial crisis started in December 2007 due to massive growth, increased complexity and leverage in credit securities and credit derivatives (FSA, 2009). Risky mortgages worth trillions of dollars were circulated throughout the financial system while mortgage related derivatives were traded around the world. Dramatic failures in accountability, transparency, ethics, corporate governance, risk management, credit rating mechanisms combined with poor financial regulation and supervision caused excessive borrowing and risky investments resulting in a global financial crisis (FCIC, 2011).  The immediate effect of the crisis was the collapse of a globally known two institutions; an investment bank Lehman Brothers and an insurance company American International Group (AIG). The impact of the crisis was felt by households and business in U.S and in all around the world. The cost of crisis is assumed to be an output loss of USD 6 trillion to USD 14 trillion which amounts to a loss of between USD 50,000 to USD 120.000 for every U.S. household (Lutterall et al., 2013).

The purpose of this study is to measure the efficiency trend of different bank groups in Turkish banking sector after the local and global crisis occurred in 2001 and 2008. The contribution of this paper for scholars and practitioners is that it provides an efficiency analysis of banks for post-crisis period. The research is an initial in analyzing and comparing the efficiency of participation banks with other bank groups. Data is gathered for the period of 2008-2012 and examined using the method of data envelopment analysis (DEA) model.

## 2  General Appearance of Turkish Banking Sector

In Turkey financial system is operating with small scales and at the growth stage when compared with developed countries (BAT, 2009b). Banking sector has a leading role in terms of asset size, number of employees, branches, transactions and customers (BRSA, 2013) The growing trend of banking sector is continuing in the recent years. Due to the developments in information and communication technologies the volume of financial transactions provided by internet banking and mobile banking has increased. The number of ATM and POS machines has expanded due to the

Table 2.1 presents the number of banks in Turkish banking sector according to the ownership structure of different bank groups. The three functional groups in Turkish banking sector are; deposit banks, development & investment banks and participation banks according to the Banking Law No. 5411. There are totally 49 banks by September 2013. The structural reforms after 2001 crisis required improvements in the capital adequacy levels in banking sector. Therefore banks strengthened capital through mergers and share transfers. 16 mergers and acquisitions occurred during the period of 2001 – 2011 (BRSA, 2010). As a result there are 17 foreign deposit banks. Foreign shares in private deposit banks are %20,5 whereas foreign shares in participation banks are %54. The total foreign contribution in terms of the weighted paid-in capital shares is approximately %30.

The organic growth of Turkish banking sector is continuing despite the local banking crisis in 2002 and global financial crisis in 2008. Thus the growth of selected indicators for the period of 2002 – 2102 is presented in Table 2. For instance in 2012 the assets have increased by 5.8 times reaching to an amount of TL 1.237 billion. Loans were the main item in speedy asset growth which has increased by 15 times, from TL 49 billion to TL 737 billion. The increase in loans is evidence that banks are performing intermediary activities. There is a significant growth in the amount of off-balance sheet items due to expanding rate of derivative transactions and revocable unused credit lines in recent years. Even though the loss from capital market transactions and growth of operational expenses had a negative effect, the income creation capacity of the sector has increased in 2012.

| Bank Group | Number | Ownership Structure (%) | | |
|---|---|---|---|---|
| | | Trading in BIST | Other Resident | Other Non-Resident |
| Deposit Banks | 32 | 19,8 | 42,7 | 37,4 |
| State-Owned | 3 | 19,9 | 80,1 | 0,0 |
| Private | 12 | 29,5 | 50,0 | 20,5 |
| Foreign | 17 | 0,1 | 1,9 | 98 |
| SDIF | 1 | 0 | 100 | 0 |
| Development & Investment Banks | 13 | 4 | 93,3 | 2,7 |
| Participation Banks | 4 | 19 | 27 | 54 |

| ROE | 19,8 | 15,4 | 6,4 | 14,0 | 6,6 | - | 14,2 |

***Table 3:*** *Selected Indicators for Different Bank Groups in Turkish Banking Sector for December 2013* ***Source:*** *BRSA, 2013*

As illustrated in Table 3, net period profit of banking sector has reached to TL 24 billion by the end of 2013. There are 49 banks operating with 11,986 branches and 214,810 employees in Turkish banking sector. Private

banks have a leading role in a number of items such as number of employees, number of branches, total assets, loans, deposits, own funds and net period profit. State-owned banks have the highest ROE with 19,8 while foreign banks have the highest capital adequacy ratio (CAR) which is 15,5.

Deposit banks have a significant dominance in Turkish banking sector while a decrease in the asset size and number of branches is observed during the period of 2002 – 2103. As presented in Table 4 the asset size of participation banks has increased by % 130 and the growth rate for number of branches is % 321 since 2002. The loan size and number of branches for development and investment banks have a declining trend whereas the mentioned banks have the highest return on asset ratio in the sector.

| % | 2002 | 2004 | 2006 | 2008 | 2009 | 2010 | 2013 |

## 3   Efficiency Measurements in Banking Sector

A significant amount of research explored efficiency of banks in Turkey and in other countries.  The most used technique for efficiency analysis in studies identifying banking efficiency is Data Envelopment Analysis (DEA), originally proposed by Farrell (1957). Since then a number of papers extended and applied DEA methodology. For instance Charnes, Cooper, Rhodes (1978) developed a model which had an input oriented constant returns to scale (CRS) and Banker, Charnes, Cooper (1984) proposed variable returns to scale (VRS) model (Coelli, 1996). In light of the developments about DEA methodology it has been widely used in studies about efficiency measurements in banking sector.

Behdioglu and Ozcan (2009) concluded that foreign banks were the most efficient groups in Turkey during 1999-2005 in their study using DEA application. A different result was assessed by Kok and Ay (2013) about the period of 2007-2009. They observed that state-owned banks were the most efficient group with DEA. Celik and Kaplan (2010) investigated efficiency and competition relationship while Seyrek and Ata (2010) predicted financial performance indicators using efficiency scores of banks in Turkey. Similarly Halkos and Salamouris (2004) proposes that DEA can be used as an alternative or complement to ratio analysis in their study measuring the performance of the Greek banking sector.

Staub et. al. examined cost, technical and allocative efficiencies for Brazilian banks using Data DEA for the period of 2000-2007. The results indicate that Brazilian banks have low levels of economic efficiency when compared with banks operating in Europe and U.S. Athanassopoulos and Giokas (2000) applied DEA approach in their case study, for measuring performance, productive and market efficiency of branches in the Commercial Bank of Greece.

A brief summary of the inputs and outputs proposed by past studies is presented in Table 5. Accordingly interest expenses, non-interest expenses, number of branches, number of employees, total deposits are the frequently used input parameters while interest income, total loans and net profit are the commonly used output parameters by scholars. The previous studies cover efficiency measurements in either pre-crisis or the crisis period of 2007-2008. The aim of this study is to fill the gap for post-crisis period in efficiency measurements of banking sector.

| Year | Author(s) | Period of Analysis | Inputs | Outputs |
|---|---|---|---|---|
| 2004 | Halkos & Salamouris | 1997 - 1999 | Interest Expenses<br>Total Assets<br>Number of Employees<br>Operating Expenses | Interest Income<br>Net Profit |
| 2009 | Behidoglu & Ozcan | 1999 - 2005 | Number of Employees<br>Non-Interest Expenses<br>Interest Expenses<br>Number of Branches | Total Deposits<br>Total Loans<br>Net Profit |

***Table 5****: Inputs and Outputs Proposed by Past Studies in Efficiency Measurements of Banks*

## 4 Methodology and Data

The aim of the study is to measure the comparative effectiveness of different bank groups operating in Turkey after the global financial crises occurred in 2008. In this respect data from three bank groups; private banks, foreign banks and participation banks is collected for the period of 2008-2012. Investment and development banks are not included in the analysis because they don't collect deposits. The research is an initial in analyzing and comparing the efficiency of participation banks with other bank groups. Because there are four participation banks operating with either medium or small scales, four banks with similar scales are chosen for private and foreign bank groups using. Banks with asset size shares more than 5% in the sector are classified as large scale, between 1% - 5% are medium scale and between 0,20% and 1% are small scale banks. Large scale banks are not included in the study.

Data issued annually in "Banks in Turkey" by BAT (2009a, 2010, 2011, 2012, 2013a) and statistical reports disclosed by Turkish Participation Banks Association (TKBB, 2013) in the website is used for the selection and information gathering process. For instance, in this part, comparative information about the selected indicators of the analyzed banks is presented. Changes in paid-in capital, number of branches and employees for the analyzed banks are reported in Table 6. Accordingly, increases are observed for paid-in capital, number of branches and employees of private and participation banks during 2008-2012. Paid-in capital is constant for foreign banks

| | Banks | Paid-in Capital (TL Million) | | | Number of Branches | | | Number of Employees | | | Number of Employees Per Branch | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| | TürkiyeFinans | 800 | 1.650 | 106 | 174 | 220 | 26,4 | 3.185 | 3.595 | 12,8 | 18 | 16 | (11,1) |

***Table 6:*** *Changes in Paid-in Capital, Number of Branches and Employees for the Analyzed Banks **Source: BAT;*** *2009a, 2012; TKBB, 2013*

Changes in selected balance sheet items for banks under analysis are disclosed in Table 7. In this respect, a significant growth in total assets, total loans and deposits of all bank groups is observed while participation banks have the highest rate. There are negative changes in net profit of period for some of the foreign and participation banks whereas the profitability trend is upwards for all private banks.

***Table 7:*** *Changes in Selected Balance Sheet Items for Analyzed Banks* ***Source:*** *BAT; 2009a, 2012; TKBB, 2013*

Table 8 reports changes in selected income statement items for analyzed banks. For instance, in all bank groups the growth rate of interest / profit share income is greater than the growth of interest / profit share expenses. Profit share income and profit share expenses are the terminology used in income statement of participation banks. Even though, all banks have net profits in 2008 and 2012, some of them have a declining trend in profit growth. To illustrate, net operating profits for Alternatifbank, HSBC Bank and Asya Finans have decreased in 2012 when compared with 2008.

| | Banks | Interest / Profit Share Income (TL Million) | | | Interest / Profit Share Expenses (TL Million) | | | Net Operating Profit (TL Million) | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | Years | 2008 | 2012 | % | 2008 | 2012 | % | 2008 | 2012 | % |
| Private Banks | Şekerbank | 1.322 | 1.731 | 30,9 | 695 | 896 | 28,9 | 182 | 311 | 70,8 |

To measure and compare the efficiency of banks in different bank groups, a non-parametric method, Data Envelopment Analysis is used. Data Envelopment Analysis Program developed by Coelli (1996) is applied under the assumption of constant returns to scale (CRS). Data Envelopment Analysis is a non-parametric method.

Input-oriented technical efficiency measurement is used. Due to the intermediary function of deposit and participation banks, funds borrowed, interest/profit share expenses, deposits are used as inputs while interest/profit share income, loans, net operating profit are used as outputs.

## 5 Results

The results of the input oriented CRS model for analyzed banks are presented in Table 9. Accordingly, foreign banks have the highest average efficiency score of 0,9918 for the period of 2008 – 2012. HSBC, with an efficiency score 1, is the most efficient Bank in the group. Foreign banks are closely followed by participation banks which have an average efficiency score of 0,9878. Türkiye Finans is the most efficient bank in the group with a score of 1. Private deposit banks have the lowest average efficiency score which is 0,9504.

| | Years | 2008 | 2009 | 2010 | 2011 | 2012 | Average |
|---|---|---|---|---|---|---|---|
| **Private Deposit Banks** | Şekerbank | 1 | 1 | 0,8791 | 1 | 0,9052 | **0,9568** |
| | Türk Ekonomi Bankası | 0,8711 | 0,8698 | 0,8121 | 0,9450 | 0,8598 | **0,8716** |
| | Anadolubank | 1 | 1 | 1 | 1 | 1 | **1** |
| | Alternatifbank | 0,8919 | 0,9766 | 1 | 1 | 1 | **0,9737** |
| | **Average** | 0,9403 | 0,9616 | 0,9228 | 0,9862 | 0,9412 | **0,9504** |
| **Foreign Banks** | ING Bank | 0,9530 | 1 | 1 | 1 | 1 | **0,9906** |
| | Citibank | 1 | 0,9714 | 1 | 1 | 1 | **0,9942** |
| | Denizbank | 1 | 1 | 1 | 0,9156 | 1 | **0,9831** |
| | HSBC Bank | 1 | 1 | 1 | 1 | 0,9958 | **0,9991** |
| | **Average** | 0,9882 | 0,9928 | 1 | 0,9789 | 0,9989 | **0,9918** |

*Table 9: Efficiency Scores of the Analyzed Banks*

*Figure 1: Comparative Analysis for Efficiency Scores of Bank Groups in 2008-2012*

*Figure 2: Trend Analysis for Efficiency Scores of Bank Groups in 2008-2012*

Comparative analysis for efficiency scores of bank groups are presented in Figure 1. In 2008 and 2009 participation banks were fully efficient and they were followed by foreign banks. In 2010, foreign banks were the most efficient while private banks had the lowest average efficiency scores among the other groups. 2011 was the only year when the private banks were the most efficient. In 2012 the efficiency scores of participation and foreign banks were very close where participation banks were slightly ahead. Private banks' success in 2011 didn't continue in 2012. Yet, they had the lowest efficiency scores.

Figure 2 illustrates the trend analysis for efficiency scores of bank groups during the period of 2008 and 2012. In 2008, 2009 and 2012 participation banks have the highest efficiency score of 1. In 2010 foreign banks and in 2011 private banks have the highest efficiency scores. The overall performance of foreign banks is the highest while participation banks have an increasing trend in efficiency scores since 2010. In 2011 and 2012 participation banks are little far efficient than foreign banks. Private banks had unsteady efficiency scores in five years. Even though they recovered from 2010 and performed an efficient year in 2011, the improvement didn't continue in 2012. Foreign banks and participation banks had an upward trend of efficiency scores whereas private banks had a downward trend of efficiency scores in 2012. However the difference is not very large. In fact the average efficiency scores of the three bank groups for the period of 2008-2012 are close to each other.

## 6    Conclusion

The growing trend of Turkish banking sector is continuing in the recent years despite the local banking crisis in 2001 and global financial crisis in 2008. Total assets rose from USD 130 billion to nearly USD 800 billion during the period of 2001-2013. Foreign banks and participation banks had increased their effectiveness since 2001 in the banking system. This paper examined the comparative efficiency of private banks, foreign banks and participation banks during the post-global crisis period of 2008-2012. Because there are four banks with medium and small scales operating in participation banks group, four banks with similar scales are chosen from foreign and private banks groups. Data Envelopment Analysis, a non-parametric method frequently applied by scholars measuring bank performance, is used for efficiency evaluation. The inputs of the efficiency model are funds borrowed, interest/profit expenses, deposits and the outputs are interest/profit share income, loans, net operating profit. The results show that average efficiency score of foreign banks is the highest for the mentioned 5 year period. Participation banks' average efficiency score is very close to performance of foreign banks. Further, in 2008, 2009 and 2012 participation banks were fully efficient. The findings of the study are consistent with the evaluation of BRSA in the report about Structural Developments in Banking (2010): *"...Numeric data show that the participation banks are presenting a performance above the sector for all capacity indicators and that they are in a fast development process."* This study is an initial in comparing the performance of participation banks with other bank groups. In addition, the efficiency performance of private banks is lower than the efficiency performance of foreign banks and participation banks.

# How to Increase Market Capitalization in Eurasian Markets?

Asst. Prof. Dr. Sıtkı Sönmezer (Beykent University, Turkey)
Assoc. Prof. Dr. İlyas Sözen (Beykent University, Turkey)

## Abstract

The objective of the study is to put forth the difference between the characteristics of Eurasian markets and the developing country markets and test convergence hypothesis based on market capitalization. Factors that obstacle foreign investments into these markets are assessed and possible ways to eradicate the gap between these markets is discussed. Market based variables such as number of listed companies is combined with other variables that may shed light to the investment environment to have a better understanding of the factors affecting market capitalization. Multi regression analysis are done for the markets that succeed in coaxing foreign investors and domestic investors to their market and the study highlights the factors that countries need to focus in order to converge to the successful ones.

## 1   Introduction

Stock markets may play a key role in fostering growth in Eurasian countries as they may provide a source of external financing for market participants. Obviously, external financing may be used to invest in new projects, plant, equipment etc. It is evident from the comparatively low trading volume levels of these countries that domestic interest in stock markets is insufficient. Thus, characteristics of these markets have to be rearranged to coax foreign investors who have interest in these markets but also fears regarding with these markets have to be mitigated. This study examines the factors that may trigger the fears of investors and aims to indicate the areas where to advance for the regulators.

Convergence of Eurasian markets with the developed markets may accelerate with rapid advancements in the financial sector and this study uses Market Capitalization as an indicator of convergence which is computed by multiplying the share price of listed companies with the number of shares outstanding. Thus, Market Capitalization may increase twofolds; price increases in the stock prices and increases in the number of shares.

Consequently, it is essential to prioritize factors affecting share prices as number of shares is arbitrary and prices are adjusted proportionately by the increase in shares outstanding. It is clear that countries aiming to increase their shares prices, should increase the demand for their shares. Intuitively, demand may increase by increasing the number of demanders. These markets need to attract more investors either domestic or foreign but the latter is more promising as they are more affluent most of the time. So it is clear whom to target for increasing market capitalization and which factors shall be improved to attract them is the focus of this study.

Financial Markets are center of attraction for high net worth investors and funds. However, these investors eye out well-functioning markets where price and volume information is accurate and timely provided; liquidity is present in terms of marketability, price continuity and depth; where internal efficiency is present where transaction costs are low and where external efficiency is present where prices adjust to new information as fast as well functioning developed markets.

Liquidity in a market may be crucially important for investors as they want to exit a market quickly as well as they enter a market. In that sense, lack of marketability, lack of the ability to sell the stock quickly, may cause investors avoid that particular investment. Similarly, price continuity, which can be described as prices not deviating from one transaction to the subsequent transaction when there is no new information regarding with the security, is another essential factor that may influence investing decisions.

Even if investors can market their securities, they need to be assured that the price they are going to convert their security into cash will not differ significantly from the recent transaction's price. Intuitively, price continuity has to be present in a market that aims to attract foreign investors as one of the reasons that foreign investors enter a market is for possible higher returns. When they are forced to sell at lower levels, their profit margins will surely diminish and this fact may avoid them from investing.

From liquidity perspective, depth may also important. In a market where lots of buyers and sellers that are willing to trade the securities at the current price and also at prices below and above the current price may be a factor attracting foreign investors who want to trade in larger scales. Similarly, lack of depth may reduce profit margins as prices will possibly change significantly and adversely when no counter party is found.

Finally, trust in the financial system, ability to find relevant and accurate financial information, robust and fair legal system and good faith and character of intermediaries, in terms of fronting, kickbacks etc. may all be determinants of participation in a market but some of the above mentioned factors are beyond the scope of this study due to lack of information.

The objective of this study is to provide evidence that whether Eurasian markets may significantly attract foreign investors or not and to determine which factors might have increased the foreign participation rates.

Moreover, what external factors may convince foreign investors to invest in these markets and what conditions may affect their decision is discussed in this study. It is evident that interest rates are at lower levels and growth rates are not promising in the developed countries in recent times. As a result, funds flow from these markets to the emerging ones to pursue higher returns despite higher risks.

## 2   Related Theories and Literature Review

Literature regarding with market capitalization and foreign funds are mostly interrelated but classified separately in this study.

### 2.1  Market Capitalization

Convergence Hypothesis examines the possibility of low growth companies catching up the gap with the countries that have higher economic growth (Baumol, 1986). This hypothesis is analyzed in depth by economic growth in the macroeconomic literature but the focus is diverted to financial markets recently. Some studies have examined convergence in terms of financial development via banking sector (Fung, 2009), some studies have searched convergence in terms of stock markets. (Narayan, Mishra and Narayan, 2011). They show evidence that ten to fifteen years is needed for convergence take place.

The significant positive correlation between stock market development and economic growth are evidenced in the literature (Atje & Jovanovich, 1993; Levine & Zervos, 1998). Hussain, Rehman and Rza (2012) similarly provide evidence that stock market development has led to economic growth in Pakistan.

An efficient market with a robust financial sector that provides liquidity are assumed to have a crucial importance in economic performance The liberalization and deregulation of the financial system enabled foreign capital to flow to these markets. (Das, 2014)

### 2.2  Foreign Equity Inflows

There are various theories regarding with why foreign capital may flow to other markets and they aim to explain the rationale behind equity flows. Some theories try to explain the reasons why foreign inflows take place, namely, base broadening theory and omitted variables theory; some try to explain the rationing of these flows such as feedback theory and price pressure hypothesis.

Among these theories, base broadening hypothesis is a model that indicates how broadening the investor base for a stock or a market, may increase stock values permanently through risk pooling (Merton, 1987). Foreign investors are well aware that when they decide to enter a market, they may have the power to move the prices of equities at a higher price than the current prices and sustain the price level of the equity prices as the market will now be aware of the presence of the new comers and the prices may be adjusted with this reality. Foreign investors may examine markets to exploit an opportunity as such. Tilmann (2013) have provided evidence that capital inflows affect asset prices by using a panel VAR.

Omitted variables hypothesis states that despite a significant correlation between equity inflows and security prices, additional factors may play a significant role in explaining the correlation. In this study, it is aimed to put forth the possible additional factors that may help the academicians that test this hypothesis. Earlier studies have used returns of Morgan Stanley World Price Index, S&P 500, Mexican Bills, dollar–peso exchange rate, stock price volatility and percent growth in aggregate earnings forecasts as omitted variables. (Clark and Berko, 1996) Similarly, the hypothesis may well be adapted to determine the relationship among foreign equity inflows and other factors.

The feedback theory suggests that investors evaluate the recent information on prices and make transactions according to the recent information. Eurasian markets should reduce the obstacles that may cause foreign investors to question the completeness and accuracy of the information they provide.

When foreign investors trade with feedback, there are two main forms; a positive feedback strategy suggests that foreign investors sell when there is a decline in the market and they buy stocks when the market is rising. The direction of their trade may move the prices of securities to extremes and the host country should monitor closely to take corrective actions if necessary.

Regarding with the increased liquidity provided by the foreign inflows, markets become more efficient as foreign funds request stricter disclosure requirements which may enhance the dissemination process of new information and transparency (Bae, Bailey and Mao 2006). Levine and Zervos (1998) also found that stock markets dissemination of information.

Moreover, when there are foreign equity flows into a developing market, they lead new information to be incorporated into prices more quickly (Todea and Pleşoianu, 2013). Similarly, high transaction costs and low liquidity levels may extend the time period of the above mentioned incorporation process (Schatberg and Rieber, 1992). Todea and Pleşoianu (2013) have analyzed the effects of foreign portfolio investments on stock market efficiency of Central Eastern European Countries and show evidence that they play a positive role in the degree of efficiency.

Choong, Baharumshah, Yusop and Habibullah (2010) show evidence that countries that have threshold level of stock market development, are affected positively from capital inflows. As a stock market indicator they have used total stock value to GDP ratio. They argue that transformation of local stock markets is obligatory to handle equity flows or host countries may face detrimental effects.

## 3   Data and Methodology

35 countries data are gathered from World Bank databases for the years 2002-2012. These countries, namely, Argentina, Armenia, Brazil, Bulgaria, Chile, China, Colombia, Croatia, Cyprus, Czech Republic, Estonia, Georgia, Greece, Hungary, India, Indonesia, Kazakhstan, Korea, Rep., Kyrgyz Republic, Latvia, Lithuania, Macedonia FYR, Malaysia, Mexico, Peru, Philippines, Poland, Romania, Russian Federation, Slovak Republic, Slovenia, Thailand, Turkey, Ukraine, Venezuela, RB. Some countries are eliminated due to lack of information. Our dependent variable is the market capitalization, and independent variables are namely, number of listed domestic companies, Stocks traded-turnover ratio in percentages, Foreign direct investments in US dollars, Real interest rates in percentages, annual GDP growth, The Chinn-Ito index (KAOPEN), Voice and Accountability, Political Stability and Absence of Violence/Terrorism and Control of Corruption.

Multi regressions are run annually and significant factors affecting market capitalization are analyzed. The form of the multiregression used is as follows:

$$Y_t = B_0 + B_1 Y_1 + B_2 Y_2 + \ldots + B_n Y_n + u_t \qquad (1)$$

where,

$B_o$ is the intercept and the coefficients belongs to the pertaining independent variables as in $B_n Y_n$, $t = 1 \ldots T$ is the time index and $i = 1, \ldots, N$ is the country index, $Y_t$ is the explained variable, market capitalization.

Independent variables are explained here below (WB Data, 2014):

- Portfolio equity, net inflows (PENI $): Portfolio equity includes net inflows from equity securities other than those recorded as direct investment. These flows are mainly composed of shares, American Depository Receipts (ADRs), global depository receipts or European Depository Receipts (EDRs), and direct purchases of shares in local stock markets by foreign investors.
- Foreign direct investment (FDI), net inflows ($): Foreign direct investment are the net inflows of investment to acquire a lasting management interest (10 percent or more of voting stock) in an enterprise operating in an economy other than that of the investor.
- Market capitalization (MC $): is the sum of the product of each listed share price and the number of shares outstanding of that particular share.
- Listed domestic companies (LDC): total listed domestic companies are the domestically incorporated companies listed on the country's stock exchanges at the end of the year. Investment companies, mutual funds, or other collective investment vehicles are excluded.
- Stocks traded, turnover ratio (STTR %): Turnover ratio is the total value of shares traded during the period divided by the average market capitalization for the period. Average market capitalization is calculated as the average of the end-of-period values for the current period and the previous period.
- Inflation (INF): Consumer Price Index
- Real interest rate (RINT): Real interest rate is the lending interest rate adjusted for inflation as measured by the GDP deflator.
- GDP growth: Annual percentage growth rate of GDP at market prices based on constant local currency. Aggregates are based on constant 2005 U.S. dollars. GDP is the sum of gross value added by all resident producers in the economy plus any product taxes and minus any subsidies not included in the value of the products. It is calculated without making deductions for depreciation of fabricated assets or for depletion and degradation of natural resources.
- Voice and Accountability (VA): capturing perceptions of the extent to which a country's citizens are able to participate in selecting their government, as well as freedom of expression, freedom of association, and a free media.
- Political Stability and Absence of Violence/Terrorism (PV): capturing perceptions of the likelihood that the government will be destabilized or overthrown by unconstitutional or violent means, including politically-motivated violence and terrorism.
- Control of Corruption (CC): capturing perceptions of the extent to which public power is exercised for private gain, including both petty and grand forms of corruption, as well as "capture" of the state by elites and private interests
- The Chinn-Ito index (CII) is an index measuring a country's degree of capital account openness. The index was initially introduced in Chinn and Ito (Journal of Development Economics, 2006). KAOPEN is based on the binary dummy variables that codify the tabulation of restrictions on cross-border financial transactions

reported in the IMF's Annual Report on Exchange Arrangements and Exchange Restrictions Chinn-Ito Index, 2014).

## 4 Findings

While trying to determine the factors influencing market capitalization, it is realized that factors vary from year to year as multi regressions are run for each year. The descriptive statistics of the data are given in Table 1. significant factors in explaining the change in market capitalization are given in Table 2.

*Table 1 Descriptive Statistics*

The effects of Portfolio equity, net inflows are found to be significant for the years 2002, with a t-value of 4.304. It is the only significant factor for that year. Equity inflows are so influential on market capitalization that it is removed from the regressions after the first year to have a better picture for the remaining factors. High correlation between net inflows and market capitalization also inflates the variance. Stocks traded, Turnover Ratio is found to be significant for the years 2003 through 2011 in a row however, and significance varies from 1 % to 10 %. This study provides evidence those countries that aim to enhance their market capitalization, have to increase stocks traded in their market. It may be deducted that Investors prioritize the ability to find a counter party and/or to convert their investments into cash quickly at fair prices.

Number of Listed domestic companies in a market is another determinant of market capitalization for the years 2004, 2005, 2010, 2011 and 2012 with t-statistics of 2,593, 2,134, 2,086, 2,232 and 4,392 respectively. It may be important to note that number of investment options markets provide to investors are essential in terms of market capitalization and by the time, the significance have increased as this factor is the only factor in 2012.

Foreign direct investment, net inflows are excluded from the independent variables list most of the time to overcome multicollinearity but for the years 2004 and 2005, variance inflator factor of the variable allowed us to incorporate its data into the model and Foreign direct investment, net inflows are found to be significant for the year 2005 with a t-statistic of 3.91. Either portfolio equity or foreign direct investments are significant factors affecting market capitalization rates. Intuitively, foreign funds broaden the base for these markets. In order to increase market capitalization, countries should seek ways to attract foreign capital.

Annual GDP growth has explained the change in market capitalisation for the years 2006, 2007 and 2011 with t-statistics of 2,030, 3,321 and 1,744. This variable was excluded from the list for three years due to multicollinearity concerns. Growth in an economy may attract investors tracking higher returns arising from higher growth rates.

Voice and Accountability is found to be significant in 2012 with a t-statistic of -2,233. This study failed to Show evidence for the significance of Inflation, Real interest rates, The Chinn-Ito Index, Political Stability and Absence of Violence/Terrorism and Control of Corruption on Market Capitalization.

## 5   Conclusion

Developed Countries and some developing countries enjoy relatively higher market capitalization as when they have higher capitalization; they may have access to financing. Countries that lack the adequate market capitalization should review factors that have an impact on it. Advancement in the positively affecting factors and mitigation of the adverse factors may help these countries to converge to the succeeding countries.

Number of Stocks traded in a market constantly affects the market capitalization in our findings and foreign funds play a critical role in market capitalization as well. To coax foreign investors, countries may aim to improve conditions and accountability may play a vital role. Growth rates may also attract foreign and domestic investors but higher market capitalization will lead to higher growth rates and higher rates will probably trigger new investments in these markets.

Developing Markets shall focus on the factors influencing market capitalization and keep in mind that these factors vary by time depending on the financial, social and political climate.

Possible ways to attract foreign investments in Eurasian markets may be provided by creating awareness for these markets; foreign investors should see these markets as a sound alternative for the markets they participate. This can be achieved by offering attractive options that have similar risk and return profile compared to the existing options foreign investors exercise. Breadth of a market, number of firms in an exchange, may not be influential in investment decisions as quality of the firms may have a priority. Thus, lack of firms that have sufficient market capitalization, stable dividends payout patterns or the existence of the of likelihood that the firm will have a stable dividend payout pattern in the near future may cause foreign investors to refrain from investing in these markets as well as the risks pertain to these investment.

# Central Banks on the Cross Roads - The Case of Macedonia

Prof. Dr. Ljube Trpeski (Ss. Cyril and Methodius University, Macedonia)
Dr. Bogoljub Jankoski (National Bank, Macedonia)
Ph.D. Candidate Vesna Kondratenko (National Bank, Macedonia)

## Abstract

We focus on the use of unconventional measures implemented during the financial crisis and their impact on operational efficiency and independence of the central banks, including the National bank of Republic of Macedonia (NBRM). Measuring the impact of the new policies on the independence and operational efficiency of the central banks, we try to assess their capacity to maintain the price stability as primary monetary policy objective. In the paper the following methods are used: quantitative method, comparative method, particularly in comparison of the level of operational efficiency and the independence of central banks, as well as econometric method applied in operational efficiency analysis of the selected group of countries (developed, developing countries and countries in transition). As the other central banks, NBRM face the challenge to preserve its role in maintaining price and financial stability and economic strength of the country, without jeopardizing its independence. During the crisis, in coordination with other economic policies, NBRM succeeded to maintain macroeconomic stability and contributed to the mitigation of internal and external economic shocks. Also, NBRM managed to keep very high level of its legal and factual independence, measured by the standard indicators. However, the achievement of these multiple goals, resulted in decrease in the level of its operational efficiency, as it was case with the other central banks analyzed in this paper. Main message is that central banks have to undertake coordinated measures to fulfill their goals but also to take some measures to improve optimal level of efficiency.

## 1 Introduction

The last three decades, we have witnessed a generalized reduction of inflation. This was a reflection of the commitment of central banks of the advanced and the developing countries to attain the price stability as a primary goal. The pledge to price stability was credible thanks to greater independence achieved by central banks, both de jure and often de facto, particularly from fiscal authorities, during those years. The legitimacy of monetary policies was strengthened by lower inflation.

With the escalation of the economic and financial crisis in 2008, many countries have faced with significant decline of the fiscal inflows in parallel with the increase of government expenditures, so in circumstances of growth of public debt, central banks had an active role in preventing the further spread of the crisis and creating conditions for stable and sustainable economic growth. In 2010, macroeconomic policies were faced with new challenges as the cost of financing of the government debt increased significantly, especially in the peripheral member states of the euro zone, which contributed to the unsustainability of their fiscal policies. In order to prevent further expansion of the crisis and to mitigate the negative effects of the recession, central banks have taken many measures. A number of central banks lowered short-term policy rates to their zero lower bound and kept on that extraordinary low level for a quite long time. In order to revive the credit activity and economic growth, central banks extended the range of acceptable collateral for monetary policy operations and reduced the reserve requirements ratios.

But the financial crisis urged central banks to implement wide range of unconventional measures which were an essential element of their new strategies. However, the pressures to overload monetary policy with many goals, even if the tasks are claimed to be temporary, may lead to disappointment and loss of credibility for central banks (Sanchez, 2013). The potential for further rising costs and declining benefits has huge impact on the independence of central banks, because only financially independent central bank may be de facto independent. Did the five years of extraordinary monetary easing and unconventional measures change the character and the nature of independence of the central banks? Is an evolution happening in this field? Central bank independence is traditionally understood as preventing political pressures on the monetary policy. This could be named as struggle against 'fiscal dominance'. But the crisis has shown that this is narrow understanding of the independence of the central bank. Expanded concept of central bank independence includes other categories: "financial dominance" and "expectations dominance". The struggle against "financial dominance" means preventing pressure and impacts that come from financial markets and the highly indebted parts of the private sector. On the other hand, the strong involvement in resolving problems arising from the crisis contributed to unrealistically perception that the central bank can do much more than its real power. In this sense, prolonged monetary policy accommodation is perceived as the only way to overcome the crisis.

During the crisis, the line dividing monetary and quasi fiscal actions of many central banks has been blurred, driven by very high public debt. Further risks are arising from difficulties in efficient implementation of institutional structures covering both monetary policy and macro prudential policy mandates, as well as in

fulfilling the price stability mandate in the current international environment, which is characterized by extensions for quantitative easing and greater volatility of financial flows (Marek Belka, 2013). This issue is particularly pertinent for emerging volatility of emerging economies.

## 2 Monetary Policy and Unconventional Measures

"Extraordinary times call for extraordinary measures, and we have already gone beyond traditional policy measures," (Ben Bernanke 2009).

The financial crisis urged the central banks to go beyond the standard monetary policy measures. The sub-prime crisis and the collapse of Lehman caused some banks to hedge against adverse liquidity risk which led to increase of the overnight rates in interbank markets and to high segmentation of the money markets. In response, the central banks of the advanced economies, Fed, Bank of England, European central bank and Bank of Japan, adopted several unconventional policy measures which led to high expansion of their balance sheets (Figure 1).

*Figure 1.* The total assets of the ECB, Fed, Bank of England and Bank of Japan

Unlike indirect impact on long-term interest rates which is usually conducted, during the recent financial and economic crisis, central banks started directly to affect the long term interest rates through unconventional measures of monetary policy as: i) credit easing by providing direct long term liquidity; ii) quantitative easing by purchasing long-term bonds and iii) forward guidance through providing information about future macroeconomic variables and stance of monetary policy. Therefore, when most central banks of advanced economies neared to zero lower bound, forward guidance was used to convince markets that the central bank will keep the rates on low level for longer period than consistent with its usual policy rule, which meant that they would allow inflation to go higher.

This policy measures had four objectives: first, to ease funding conditions for credit institutions and enterprises; second, to reduce money market term rates; third, to encourage credit institutions to maintain or expand their lending to households and enterprises; and, fourth, to improve market liquidity in important segments of private debt securities markets.

Finally, the accommodative monetary policy had to facilitate the process of restructuring the banks' and the private sector balance sheets, and to provide further implementation of structural reforms which are necessary preconditions for the revival of economic activity and strong and sustainable economic growth.

Generally, the implemented policies by the central banks in advanced economies were quite effective. The prolonged period of low interest rates and central bank asset purchases improved some indicators of bank soundness and revived the dis-functioned financial markets. In US, the liquidity in the securitized credit markets was restored and the market conditions were normalized. In euro area, the monetary policy measures prevented the huge bank deleveraging and credit contraction, as well as supported the decrease in bond yields in some euro area countries under market stress.

However, having in mind a lot of weaknesses in the financial systems, there are still risks of further contraction of credit and its effect on economic growth.

Macroeconomic indicators for the United States still do not provide a clear picture regarding the pace of recovery of the U.S. economy. Indicators showed growth of business confidence, but the data from the real sector do not yet indicate significant acceleration in economic activity. In such conditions, until more confident and more certain macroeconomic indicators are obtained, it is quite certain that the Fed will continue with its loose monetary policy and large scale asset purchases.

The reduced tensions in financial markets as well as loosening of fiscal consolidation allowed euro-zone to exit from recession, but the impediments on economic growth are only partially removed. Domestic demand is

still weak and despite the decrease in yields on long-term bonds, the interest rates on loans are still high, so the volume of lending as a percentage of GDP continued to decline, particularly to non-financial corporations. The latest figures for the financial sector in the euro area suggest that the impaired assets are still high, profitability is low, and the loss absorption capacity is still too weak (ECB Financial Stability Review, November 2013).

## 3    The Role of Monetary Policy of the NBRM

NBRM applies monetary strategy of the exchange rate targeting. This means that the monetary policy is focused on maintaining low and stable inflation as the primary goal, while maintaining the stability of the nominal exchange rate of the denar against the euro, as an intermediate target. The changes in the monetary policy are usually response to the changes in the macroeconomic environment, which have a direct impact on the implementation of monetary targets. Thus, in circumstances where the stability of the nominal exchange rate is intermediate monetary target, the main point of interest of the monetary policy is the external position of the economy. The changes in the external position are mainly result from the private sector and government decisions and expectations, and from the external environment on the other side. They affect supply and demand on the foreign exchange market, and thus affect the stability of the exchange rate. In such conditions, the monetary policy of the NBRM has a proactive role in successful accomplishment of the defined monetary goals.

Maintaining the stability of the nominal exchange rate has proved as a crucial importance to the stability of prices and stable inflation expectations, so that in the period since 2004, inflation measured through the consumer price index, was around 2.5%, on average (Figure 2). At the same time, the level of foreign exchange reserves constantly gravitated around the adequate level which expressed the capacity for surpassing the pressures on the exchange rate and provided high credibility of the monetary policy.

*Figure 2. Consumer price index Source: NBRM*

*Figure 3. Official reserve assets **Source:** NBRM*

*Figure 4. CB bills rate (key policy rate) **Source:** NBRM*

*Figure 5. Exchange rate MKD/EUR **Source:** NBRM*

The outbreak of the global economic and financial crisis initially had a limited influence on stability in Macedonia, mainly due to a lower degree of integration of the Macedonian financial sector to the global markets. For these reasons, NBRM did not respond by easing monetary conditions immediately. However, prolonged uncertainty in the external environment and reduced economic activity of the most important trading partners had negative impact on the Macedonian economy that is characterized by high foreign trade, especially with the countries from the European Union. After the bankruptcy of the investment house Lehman Brothers, risk perceptions of investors increased, leading to a significant reduction in transactions volume and to the lack of liquidity in international markets. These trends were reflected on the markets in the region by increasing external imbalances, the demand for foreign exchange has climbed and the pressures for depreciation of the domestic currency surged. To overcome these developments, the NBRM responded with significant interventions by selling foreign exchange and providing sufficient foreign currency liquidity to markets (Figure 3). At the same

time, unlike the central banks of developed economies, which reacted towards monetary easing, the NBRM increased the interest rate on the main monetary policy instrument. Monetary tightening contributed the balance of payments pressures to be reduced and the foreign exchange reserves to be maintained around the adequate level, which helped keeping the external sustainability and the peg (Figure 5).

In the next period, economic activity declined and inflation expectations have been stabilized, that imposed a lessening the CB bill rate. However, due to the potential risks of re-deterioration of external imbalances in the country, the reaction of the NBRM towards loosening of the monetary conditions was gradual (Figure 4).

While the monetary policy was not limited with interest rates close to zero lower bound, prolonged duration of the global economic and financial crisis led the NBRM to join central banks that applied unconventional measures. Taking into account the potential risks of re-deterioration of external imbalances and inflationary pressures, as well as with aim to provide support for other purposes, including credit growth, several changes were made in the reserve requirements. Namely, the reserve requirement was reduced by the amount of newly granted loans and investments in debt securities issued by net exporters and/or by non-financial companies that use these funds for financing projects for domestic electricity production. The main purpose of this temporary measure was to provide support to systematically important sectors of the economy in terms of the balance of payments flows and the foreign exchange market movements. Also, the reserve requirement ratio on the liabilities in domestic currency was lowered, simultaneously tightening reserve requirement ratio on foreign exchange liabilities. Additionally, the banks' long-term liabilities to non residents are excluded, as 0% reserve requirement was prescribed. This measure achieved dual effect: first, it provided stimulus to local currency deposit growth in and second, encouraged the longer-term capital funding of domestic banks.

Throughout the crisis, the banking sector remained sound, relying on domestic sources of funding, preserving strong capital adequacy and liquidity ratios, and keeping non-performing loans in check with adequate provisioning.

## 4 The Impact of the Crisis on the Independence of Central Banks and their Operational Efficiency

The issue of the main challenges of the contemporary central banking, especially during the current global economic and financial crisis has triggered numerous debates and discussions throughout the world, attracting the attention of both, the practitioners (central bankers) and the academics. Many central banks, especially from developed countries played critical role during the crisis in maintaining financial stability and supporting the macroeconomic policy. Hence, these two goals got specific weight and importance in the central bank regulations, certainly without jeopardizing the main goal - maintenance price stability. This is actually very important trend and challenge for the central banking in the future. In order to accomplish these goals, central banks should have very high level of independence, transparency and accountability which are certainly main preconditions for their efficient management and governance.

### 4.1 Analysis of the legal independence of the central banks

The significance and the importance of the central bank independence are reflected in the fact that it is the necessary precondition for accomplishing their legally determined objectives, tasks and functions. In order to determine the level of central bank independence and to examine the basic relations between the independence and the main macroeconomic indicators, it is necessary to predetermine independence criteria. Independence criteria are the basis for construction of the main analytical set of instruments for measuring central bank independence. Namely, the legal independence of the central bank could be viewed from several aspects:

- Functional independence, which implies independent determination of the objectives and tasks, i.e. primary objective - maintaining price stability, has to be unambiguously expressed and defined in the central bank law;

- Institutional independence, which implies absence of external influence in the decision-making processes;

- Personal independence, which is observed through elimination of political pressure on the decision-making bodies of the central bank;

- Financial independence, which is observed through autonomy in the disposal and use of funds.

The independence of the central banks does not exclude their accountability and obligation for being transparent in their operations. They should go together, "hand by hand".

As previously explained, in order to measure the central bank independence, it is necessary to determine appropriate criteria for quantification of the level of independence. Therefore, so-called legal indexes are used for measuring of the central bank legal independence. The most detailed indexes are determined by Cukierman/Webb/Neyapti in 1992. These authors take into account 16 characteristics (variables) of central bank independence divided into four groups of variables (issues):

- Chief executive officer in the central bank (governor);

- Formulation of monetary policy;

- Objectives of the central bank and

- Central bank lending.

Also, very frequently "Modified Cukierman index" is used, or Cukierman LVAW index, which takes into account 18 characteristics (variables), divided into five groups:

- Central bank board;

- Central bank objectives;

- Policy formulation;

- Central bank lending and

- Accountability.

Each of the variables has been disaggregated into several individual variables. Each individual variable has a numerical coding from 0 (lowest level of independence), to 1 (highest level of independence).

In the table below, using the Cukierman LVAW index, we made a comparison of the level of independence of the NBRM with the independence of central banks of several selected EU countries - potential EMU members: Czech Republic, Hungary, Poland and Croatia.

| | Macedonia | Czech Republic | Hungary | Poland | Croatia |
|---|---|---|---|---|---|
| 1. Central Bank Chief Executive Officer | | | | | |
| Term of office of CEO | 0.75 | 0.75 | 0.75 | 0.75 | 0.75 |
| Who appoints the CEO | 0.5 | 0.5 | 0.25 | 0.5 | 0.5 |
| Provisions for dismissal of CEO | 0.83 | 0.83 | 0.83 | 0.83 | 0.83 |
| CEO allowed to hold another office in government | 1 | 1 | 0.5 | 1 | 1 |
| 2. Central Bank objectives | | | | | |
| Central Bank objectives | 1 | 1 | 1 | 1 | 1 |
| 3. Policy formulation | | | | | |
| Who formulates monetary policy | 1 | 1 | 1 | 1 | 1 |
| Government directives and resolution of conflicts | 1 | 1 | 1 | 1 | 1 |
| Central Bank given active role in formulation of government's budget | 0 | 0 | 1 | 1 | 0 |
| 4. Central Bank lending | | | | | |
| Limitations on advances | 1 | 1 | 1 | 1 | 1 |
| Limitations on securitized lending | 1 | 1 | 1 | 1 | 1 |
| Who decides control of terms of lending to government | n.a. | n.a. | 0.66 | n.a | 1 |
| Beneficiaries of Central Bank lending | 1 | n.a. | 1 | n.a | 1 |
| Type of limits when they exist | n.a | n.a. | n.a. | n.a | 1 |
| Maturity of loans | 1 | n.a. | 1 | n.a | 1 |
| Restrictions on interest rates | n.a. | n.a. | 1 | n.a | 1 |
| Prohibition on Central Bank lending to Government on primary market | 1 | 1 | 1 | n.a | 1 |
| TOTAL: | 0.9 | 0.9 | 0.89 | 0.95 | 0.9 |

**Table 1.** *Comparison of the level of legal independence of a group of selected Central Banks*

The Table 1. shows that the level of independence of the NBRM measured by the Cukierman LVAW index (0.90) is equal with the level of the Czech National Bank and with the Croatian National Bank. It is higher than the level of the Hungarian National Bank (0.89) and lower than the National Bank of Poland (0.95). Generally speaking, the NBRM, Croatian National Bank and the Czech National Bank should have more active role in formulation of government's budget. The Hungarian National Bank should be more autonomous from the executive authority in the process of appointment of its governor.

What is very important, considering the central bank independence within the context of the great financial crisis, is that all analyzed central banks have accommodated their statutes in order to respond to the crisis i.e. stipulating the financial stability together with the price stability as a main central bank goal.

As explained earlier, during the crisis the central banks have been overburdened by the prolonged monetary policy accommodation and heavily posed by longer-term risks to their reputation and credibility. The gap between what central banks are expected to deliver and what they actually can deliver became too wide. Also, the confidence in their ability to fulfill their mandates for price and financial stability can be undermined by this gap and at the same time may have consequences for their independence and the operational efficiency. Such

considerations may create pressure on central banks to keep monetary policy too lax for too long. It is obvious that the effectiveness of central bank policymaking in the current environment is seriously threatened.

## 4.2 Operational efficiency of central banks

Nationwide, there is no institution that can be a benchmark for comparison of the central bank efficiency, as it is the case in the private sector. Hence, in order to determine the level of efficiency of the central bank we need to make a comparison with other central banks worldwide. To make a proper comparison, it is necessary to take into account several elements: the influence of executive authorities, i.e. the level of central bank independence; the size of the country, its population, the size of GDP, and so on.

By applying these two general principles, the definition of operational efficiency of the central bank could be derived from an analysis of the use of the central bank resources or inputs (labor and capital) in performing its legally entrusted functions, to achieve its objective or output, compared with other central banks worldwide.

Central banks with high level of operational independence under the law actually have higher discretion in the monetary policy implementation. The question is how central banks use this discretionary power. In practice, two types of inefficiencies of central banks can be distinguished: legal inefficiency and managerial inefficiency. Legal inefficiency arises from the inadequate level of operational independence, which the central bank has obtained according to the legislation in the sense that the central bank is entrusted a number of functions that are not directly related to achieving its primary objective - price stability, which in turn create inefficiency in its operations. Managerial inefficiency occurs when the central bank shows inefficiency in carrying out the functions that are directly related to the achievement of the primary objective. An example of this inefficiency of the central bank is when there are too many employees engaged in the core functions accomplishment due to the lack of will among the management to reduce the excessive employment.

In this regard it is important to emphasize the significance of two issues:

1. Outsourcing, i.e. use of services of external entities in the field of administrative functions, information technology etc.

2. Change management. This includes: risk management; proper and cost-efficient distribution of inputs, limiting the scope of the changes only in the field of the core activities of the central bank, etc.

To measure the operational efficiency of the central banks, a number of basic indices have been designed. These indices may be used as a basis for improving the efficiency of central banks by adopting good practices of those central banks that are deemed highly operationally efficient. Further in the paper we will go through the main features of several basic indices for measuring central banks efficiency.

**Hanke index**, or the central bank staff efficiency index, uses the output to input ratio and has the following form: number of employees / gross national product In this formulation, the number of employees in the central bank, i.e. the resources used by the central bank is the input, while the gross national product, i.e. the size of the economy whose normal functioning is the main goal of the central bank by providing price stability, is the output. This index provides a rough assessment of staff efficiency in the central bank. Lower value of the Hanker index indicates greater efficiency of the central bank and vice versa.

**Morgan Stanley index** shows how many employees are engaged in the central bank on 100,000 inhabitants. This index may be expressed as: (number of employees in the central bank / size of population) * 100,000. As in the Hanker index, the number of employees in the central bank is the input in this formulation, while the total population in the country is the output.

**Mendzela index** is also a central bank staff efficiency index. It uses as output the two previously mentioned indicators, the total population and the gross national product, but as input, rather than the number of employees, it uses the operational costs. So far, this index has been used for operational efficiency analysis of the central banks of OECD countries.

**Vaubel index** may be used for the central bank operational efficiency measurement, although it is not specified in the economic literature. This index may be derived using the following formula:

$\ln L = \ln b_0 + b_1 \ln M + b_2 \ln N + b_3 \ln A + b_4 S \ln M + b_5 S \ln N + b_6 S \ln A + b_7 C \ln M + b_8 C \ln N + b_9 C \ln A + b_{10} \ln I + b_{11} \ln E + b_{12} \ln Y + v$

Where:

L = number of employees in the central bank

M = money supply M1

N = number of population in the country (in millions)

A = geographic area of the country

S = grade 1 is given if the central bank is responsible for supervision of banks, 0.5 if the central bank performs this function jointly with another institution and 0 if the central bank does not perform this function

C = grade 1 is given if the country belongs to the group of countries "Conecon" and 0 if it does not belong to that group of countries

I = index of central bank independence

E = dummy variable that has the value 2.72 if the exchange rate is pegged and 1 if there is another regime

Y = GNP or GDP per capita

The input, number of employees in the central bank, is modeled as a function of its output, which is approximated with different variables: money supply, number of total population in the country, geographic size of the country, etc.

### 4.3    Pre/post crisis measuring the operational efficiency of a group of selected central banks

We have previously noted that several basic indices have been constructed for measuring the operational efficiency of the central banks. These indices can be used as a basis for improving the efficiency of central banks by adopting the good practices of those central banks that are deemed highly operationally efficient. To measure the operational efficiency of the NBRM, we will use the Hanke index and the Morgan Stanley index on several selected countries. The comparison is made with the countries that have passed the transitional process as Macedonia.

| Country | GNP in billion US dollars for 2012 | Number of employees in the central bank for 2012 | Hanke Index (Staff per Billion US dollars) |
|---|---|---|---|
| Macedonia | 22 | 433 | 20.06 |
| Armenia | 18 | 775 | 43.13 |
| Montenegro | 7 | 327 | 45.67 |
| Lithuania | 62 | 681 | 11.06 |
| Serbia | 79 | 2,136 | 27.12 |
| Latvia | 35 | 537 | 15.39 |
| Ukraine | 329 | 1,512 | 4.59 |
| Bosnia and Herzegovina | 32 | 354 | 11.21 |
| Hungary | 196 | 584 | 2.99 |
| Romania | 267 | 2 | 0.01 |
| Moldova | 12 | 466 | 38.83 |
| Georgia | 25 | 305 | 12.43 |
| Bulgaria | 101 | 860 | 8.51 |
| Croatia | 79 | 636 | 8.02 |
| Albania | 25 | 521 | 20.58 |
| Czech Republic | 285 | 1,398 | 4.91 |
| Belarus | 142 | 3,228 | 22.76 |
| Poland | 771 | 3,642 | 4.72 |
| Euro system | 11,258 | 47,567 | 4.23 |
| United States | 15,080 | 20,544 | 1.36 |
| United Kingdom | 2,288 | 2164 | 0.95 |
| Japan | 4,444 | 4,668 | 1.05 |

***Table 2.*** *Nominal GNP, number of Central Bank employees and Hanke index **Source**: Central bank web sites*

The gross national product of Macedonia as of 31.12.2012 amounted to USD 21.59 billion, and the number of employees in the NBRM at the end of 2012 was 433. The resulting index for the NBRM according to Hanke is 20.06. This shows that one billion US Dollars GNP accounts for 20.06 employees of the central bank. The Table 2, shows the rank of the NBRM regarding the operational efficiency, measured by the Hanke index, compared with the calculated indexes for operational efficiency of the central banks from a selected group of countries. The data lead to the following conclusion: out of the total number of 18 countries analyzed, Macedonia is ranked 12th. NBRM has greater operational efficiency than the following countries: Montenegro (45.67); Armenia (43.13); Moldova (38.83); Serbia (27.12); Belarus (22.76) and Albania (20.58). On the other hand, Macedonia has a lower operational efficiency than the following countries: Hungary (2.99); Ukraine (4.59); Poland (4.72); Czech Republic (4.91); Romania (6.74); Croatia (8.02); Bulgaria (8.51); Lithuania (11.06); Bosnia and Herzegovina (11.21); Georgia (12.43); Latvia (15.39).

For comparison, the operational efficiency of the Euro system is 4.23 (total GNP realized in the Euro system at the end of 2012 amounted to US Dollars 11,258,31 billion, while the total number of employees in the central banks of the Euro system is 47.567), compared with USA (1,36), UK (0,95) and Japan (1,05).

Below, we will determine the level of operational efficiency of the NBRM by using Morgan – Stanely index. The total population of Macedonia in 2012 amounted to 2,062,294 inhabitants, and the number of employees in the NBRM at the end of 2012, as we have already mentioned, was 433. So we obtain the following ratio: (433 / 2,062,294)*100.000 = 20.99.

Presented below is Table 3, which contains data for the Morgan Stanley index and its elements for the same group of countries, analyzed by using the Hanke index. The data contained in the Table 3. lead to the following conclusion: the NBRM has greater operational efficiency (lower value of the index) than the central banks of the following countries: Montenegro (49.74); Belarus (33.47); Serbia (29.35); Armenia (26.09) and Latvia (24.50); On the other hand, the NBRM has lower operational efficiency (higher value of the index) than the following transition countries: Ukraine (3.37); Hungary (5.86); Georgia (6.67); Romania (8.24); Bosnia and Herzegovina (9.13); Poland (9.48); Bulgaria (12.22); Moldova (12.74); Czech Republic (13.74); Croatia (14.20); Albania (17.35); and Lithuania (19.31).

So, out of 18 analyzed countries in transition, the NBRM is ranked 13th. This index, also as the Hanker index, provides a rough assessment of the operational efficiency of the central bank, but it is remarkable that in the analysis of a group of 18 countries using the two indexes, NBRM is ranked almost the same (12th and 13th). Of course, the precise determination of the operational efficiency requires other elements to be taken into account, both quantitative and qualitative.

The level of the operational efficiency of the Euro system using Morgan Stanly index is 14.29, USA (6.55), UK (3.43) and Japan (3.66).

| Country | Population | Number of employees in the central bank | Morgan Stanley index |
|---|---|---|---|
| Macedonia | 2,062,294 | 433 | 20.99 |
| Armenia | 2,970,495 | 775 | 26.09 |
| Montenegro | 657,394 | 327 | 49.74 |
| Lithuania | 3,525,761 | 681 | 19.31 |
| Serbia | 7,276,604 | 2,136 | 29.35 |
| Latvia | 2,191,580 | 537 | 24.50 |
| Ukraine | 44,854,065 | 1,512 | 3.37 |
| Bosnia and Herzegovina | 3,879,296 | 354 | 9.13 |
| Hungary | 9,958,453 | 584 | 5.86 |
| Romania | 21,848,504 | 1,800 | 8.24 |
| Moldova | 3,656,843 | 466 | 12.74 |
| Georgia | 4,570,934 | 305 | 6.67 |
| Bulgaria | 7,037,935 | 860 | 12.22 |
| Croatia | 4,480,043 | 636 | 14.20 |
| Albania | 3,002,859 | 521 | 17.35 |
| Czech Republic | 10,177,300 | 1,398 | 13.74 |
| Belarus | 9,643,566 | 3,228 | 33.47 |
| Poland | 38,415,284 | 3,642 | 9.48 |
| Euro system | 332,975,153 | 47,567 | 14.29 |
| United States | 313,847,465 | 20,544 | 6.55 |
| United Kingdom | 63,047,162 | 2,164 | 3.43 |
| Japan | 127,368,088 | 4,668 | 3.66 |

***Table 3.** Morgan Stanley index - number of employees in the Central Bank against the number of inhabitants*
***Source**: The Morgan Stanley "Central Bank Directory 2010"*

The Table 4 presents the changes in the staff number of the analyzed central banks from 2007-2012. Nine central banks, out of eighteen reduced the number of their employees from 2007 to 2012. Also, the Euro system reduced the number of employees for 3.13%. This was a central banks' reaction to the negative consequences of the crisis and their strong involvement in keeping the financial stability. This new role of the central banks has, of course, very negative impact of their operational efficiency. Hence, most of the analyzed central banks made appropriate reduction of their staff.

Unfortunately, eight of analyzed central banks have increased the number of their staff. Some of them very remarkably: Belarus (294.14%); Poland (83.57%) and Ukraine (47.22%). These countries will face high decrease of their operational efficiency and have to make additional extra efforts in the future.

In the analyzed period, the NBRM has increased the number of the employees for 8.25%. The main increase is done from 2007-2010. In 2011 and 2012 the number of employees decreased.

| Country | 2007 | 2012 | Change (%) |
|---|---|---|---|
| Macedonia | 400 | 433 | 8.25 |
| Armenia | 620 | 775 | 25.00 |
| Montenegro | 350 | 327 | -6.57 |
| Lithuania | 851 | 681 | -19.98 |
| Serbia | 2,521 | 2,136 | -15.27 |
| Latvia | 629 | 537 | -14.63 |
| Ukraine | 1,027 | 1,512 | 47.22 |
| Bosnia and Herzegovina | 315 | 354 | 12.38 |
| Hungary | 690 | 584 | -15.36 |
| Romania | 1,812 | 1,800 | -0.66 |
| Moldova | 445 | 466 | 4.72 |
| Georgia | 558 | 305 | -45.34 |
| Bulgaria | 928 | 860 | -7.33 |
| Croatia | 594 | 636 | 7.07 |
| Albania | 416 | 521 | 25.24 |
| Czech Republic | 1,480 | 1,398 | -5.54 |
| Belarus | 819 | 3,228 | 294.14 |
| Poland | 1,984 | 3,642 | 83.57 |
| Euro system | 49,103 | 47,567 | -3.13 |
| United States | 21,521 | 20,544 | -4.54 |
| United Kingdom | 1,789 | 2,164 | 20.96 |
| Japan | 4,912 | 4,668 | -4.97 |

*Table. 4* *Changes in Staff Numbers 2007-2012* **Source:** *The Morgan Stanley "Central Bank Directory 2010"*

We have previously pointed out that the operational efficiency of the central bank is on a high level if the central bank performs only those functions that are directly related to its primary objective - price stability. An imperative for the central bank is that the core functions have to be performed in accordance with best international practices and international standards. Does the NBRM perform additional functions, beside its core functions, that are not directly related to the primary objective? In the period from 2006 to the end of 2010, the NBRM conducted additional function - custodian of pension funds. Although the function of custodian was granted for a relatively short period of 5 years (according to the Law on the Fully Funded Pension Insurance), it was clear that its implementation is not directly related with the achievement of the primary goal and that will reduce the operational efficiency of the NBRM, as it takes effort, time and capital. Analyses show that, besides the NBRM, worldwide only the central bank of Chile performs this function. Certainly, increasing the level of operational efficiency of the NBRM is not an aim only for the central bank, but also for the society as a whole. Therefore, the joint commitment of the central bank and the other relevant factors in the country can contribute to the harmonization of the regulations for the central bank in this domain with the European standards, and make a step forward in bringing Macedonia closer to the European Union.

On the other hand, the purchase of the rare and the original coins from the territory of Macedonia, in terms of the accomplishment of the primary goal is not a core function of the NBRM. The question is whether the central bank should carry out this function. In this regard it should be emphasized that all central banks in the world, almost without exception, perform this function. Namely, the purchase of rare and the original coins incorporate the historical and educational point of monetary finance and it is an assessment of many experts that it should be carried out by the central bank.

In this regard it should be emphasized that an increasing number of central banks worldwide follow the trend of outsourcing of their functions that are not directly related to their primary objective or belong to the category of so-called support functions. Several central banks even entrust some of their functions which are not directly related to the primary objective, such as: human resources management, maintenance of the information system, etc. to specialized agencies outside of the central bank. However, the analyses that should be made in this regard will show whether the NBRM should follow this trend, viewed in a longer run. Here, besides the financial aspect, it is certainly important to bear in mind that outsourcing has to be cost effective and from qualitative aspect, that means to provide better and more efficient accomplishment of the central bank functions.

## 5   Conclusion

During the financial crisis, the central banks around the world activated a wide range of unconventional policy measures that were important element of their strategies for rescue of the financial system, for stabilizing the markets and encouraging the economic growth. These policies have changed the character and nature of the independence of the central banks. The pressures for overloading of the monetary policy with multiple goals,

although these goals are declared as temporary, given the potential risks for price stability, may adversely affect the credibility of the central banks. Furthermore, the measures taken during the crisis had a negative impact on the operational efficiency of the central banks, which contributed to a reduction of the number of employees in a large part of the analyzed central banks.

Looking further ahead, with gradual smoothing of the effects of the economic and financial crisis, central banks are at a crossroads: where should be directed to, i.e. what should be the role of unconventional monetary policy tools in post-crisis operational frameworks?

In our view, prolonged use of unconventional measures may cause problems in achieving the core central bank functions. The operational framework of the central bank should be primarily aimed at maintaining price stability and control over the short-term interest rates. This would provide enough room for reaction in extraordinary circumstances, which ensures the potential external or internal economic shocks to be easily overcome.

During the crisis, the monetary policy of the National Bank retained the concept of maintaining price stability and the stability of the exchange rate as the main priorities. However, faced with a decline in economic activity, the National Bank was triggered to introduce new measures and instruments to spur the revival of credit growth and to support certain systemic important sectors. Although these measures are unconventional because their implementations go beyond the usual range of the monetary policy, by maintaining price stability as the main priority and in coordination with other economic policies, the National bank contributed the internal and external economic shocks to be overcome easier and the macroeconomic stability to be maintained, without jeopardizing its independence.

# Features of Value Added Distribution of Gazprom Corporation in 2004-2012

Assoc. Prof. Dr. Dmitri Pletnev (Chelyabinsk State University, Russia)
Assoc. Prof. Dr. Ekaterina Nikolaeva (Chelyabinsk State University, Russia)
Zinfira Bitkulova (Chelyabinsk State University, Russia)

## Abstract

Searching for new indices of a modern corporation is one of urgent problems of modern economic science. In our opinion, there are good prospects of using "a value added" as an indicator. It reflects a corporation's ability of creating a new value, whereas its distribution between different players shows an ability of meeting their interests. The aim of the present paper is to propose a methodology and consider a calculation of the amount and distribution of values added between major groups of players on the basis of some financial statements of the Gazprom Corporation for the period of 2004-2012. The proposed methodology for estimating a value added is based on a Marxist interpretation of this concept. Such a value added can be calculated as a sum of elements that belong to different stakeholders. For our calculation, we have used data contained in the Gazprom Corporation's IFRS consolidated financial statements and quarterly reports for the period of 2004-2012. The main part of the value added of Gazprom was appropriated by the state through tax and customs systems. Its share is around 50% of the total value added. The second most important recipients of the value added are corporation owners. Their share just slightly fell short of 40% in 2010 and 2011, and in 2012 it was 33.8%. The third most important subjects in terms of value added assignments are workers. Their share has been steadily shrinking in the period from 2004 (13.8%) to 2012 (10.4%).

## 1 Introduction

In modern economic science, a discussion concerning the assessment of results of economic activity is going on. This problem is considered as one of central by experts of the World Economic Association – WEA, among which are J. Stiglitz, A. Sen and J.-P. Fitoussi (Stiglitz, Sen and Fitoussi, 2009). On the one hand, the criticism of macroeconomic indices, of a gross domestic product and other indicators of SNA *[system of national accounts]* becomes a banality. And various techniques of measuring "wellbeing" and "happiness" are offered to "support" the indices. At the microeconomic level itself, the existing system of assessing the efficiency of enterprises' activity, based on the simultaneous use of accounting and stock market data, is challenged. The first group of data is blamed for their "controllability", whereas the second one – by way of contrast - is critisised for its poor connection with a real situation. However, in our opinion, an inadequacy of the main indicators is yet a bigger problem. They are frequently employed by analysts, authorities and scientific community for assessing the overall performance of corporations. First of all, profit is at stake. Without going into details of contradictions of assessing profit as one of major economic categories, we will note that inherently it only gives some information regarding a corporation's activity efficiency - for the owners. All other concerned groups – managing directors, employees, the state, investors, suppliers, etc., even in case of a high profit may fail to satisfy their interests and expectations associated with the corporation. And a modern evaluation of the efficiency of a corporation has to consider not only interests of the owners, but also those of other stakeholders.

In these conditions, there arises a topical problem of a search for other more adequate index assessing a corporation. In our opinion, "a value added" shows some good prospects as an indicator. It reflects the ability of a corporation to create a new value, while the latter's distribution between various entities represents the ability to satisfy their interests. The purpose of the present work is to offer a methodology and consider the calculation of the size and distribution of a value added between major groups of entities by the example of the Gazprom Corporation's data for the period of 2004-2012.

## 2 Data and Methodology

The offered methodology of assessing the size of a value added is based on Marx's treatment of this concept as "newly created value" (for more details please see Pletnev, 2013). This attitude differs from the so-called "concept of an economic value added" gaining popularity, which has in reality little in common with a value added in its canonical understanding and which diverts one from the real range of problems to derivatives and particulars which only interest owners of corporations.

The value added thus understood can be calculated quite simply: as a difference between a sales revenue and material costs. However, in our opinion, it is more correct to calculate it as a sum of elements relating to various concerned entities. According to some reporting data (in the event of the JSC Gazprom it is a question of consolidated financial statements prepared according to IFRS (a regime of access to reporting data at the official website of the Company, Gazprom 2013a) and of a quarterly report of the Emitter for the 1-st quarter of the

subsequent year (the 1-st quarter of 2013 is available at the address, Gazprom 2013b), an assessment of elements of a value added at the disposal of various entities was carried out: concerning owners (a net profit, from a report on a total revenue in a IFRS consolidated statement), concerning employees (expenses on remuneration of labour, from the Note No. 26 to the IFRS consolidated statements), concerning managing directors (remunerations to members of the Board of Directors and those of the management, from Item 5.3 of a quarterly report of the Emitter), concerning the state (paid taxes, including those at the expense of employees, from Note No. 30 to the IFRS consolidated statements), concerning investors (the paid rate of interest from Note No. 27 to IFRS consolidated statements). And a sum of these elements forms the size of the Gazprom Corporation's gross value added.

## 3  Results

The gross value added of the JSC Gazprom shows steady positive dynamics. In the whole period considered it increased by 4.5 times and made 3580.2 billion rubles or 75.2% in 2012. Such a high share of a value added is explained by the character of the production activity of the Gazprom Corporation: because this is an instance of an extractive company, a value added is created due to the very fact of the production (extraction) and sale of extracted raw materials, i.e. natural gas. In this regard, there are still reserves for increasing the share of the value added: Gazprom have not yet been allowed to realize their product at retail in foreign markets, also there is a potential of the growth of the value added in the sphere of the high-level processing of natural gas. However, the share of the value added in the sales revenue of the Gazprom Corporation reduced from maximum 87.2 % in 2006 to 75.2% in 2012 in the considered period (Fig. 1).

*Figure 1. The dynamics of the gross value added and the share of the value added in the Gazprom Corporation's revenue in 2004-2012*

A detailed analysis of the structure of the value added has demonstrated that different parts of this value added falls to the share of its various entities (owners, the state, employees, managing directors, and investors). There has been obtained the following distribution of the value added with the Gazprom Corporation in 2004-2012 (Fig. 2)

*Figure 2. A distribution of the value added of the Gazprom Corporation between major entities*

The main part of the value added of the Gazprom Corporation, which belongs (for the most part) to the state, is appropriated by the latter by means of the tax and customs system (the share fluctuates around 50% of the whole value added), as well as through insurance premiums in the system of social insurance (earlier it was a unified social tax payment). Mainly, this takes place at the expense of customs payments, a severance tax and a value added tax (up to two thirds of the whole sum of taxes and customs payments). In absolute expression, the state received 10.47 trillion rubles from Gazprom - about 38% of the latter's consolidated revenues - in 2004-2012, i. e. about half of the whole created value added. And in this sense, Gazprom may certainly be called "a national property". In absolute expression, both the total amount of taxes and the sum of their separate types is steadily growing, the basic growth rate making 4.32, which corresponds approximately to a 20-percent average annual growth. At the same time, the revenue has been growing by 21.9% on an average yearly, whereas the value added has been increasing by 20.8%. Therefore, in relative terms - and this is confirmed by the further analysis - the share of the state is but insignificantly reducing. At the same time, a growth of the share of the state was observed in 2011-2012, which may signalise the beginning of a new tendency.

The dynamics of the structure of the Gazprom Corporation's tax burden can be observed in Fig. 3. As it is obvious from the figure, the state receives the major part of the value added through indirect taxation, i.e. these taxes are factually paid by consumers. It is a question of customs payments, a value-added tax and excise taxes (up to 35 percent of the value added, up to 70 percent of the whole tax burden). Also, a considerable part is made by a severance tax – a peculiar form of acquiring a land rent. In the figure, the latter tax "is embedded" in other taxes, making up to 80% in this group, and up to 23% of the whole tax burden. Also, along with the severance tax, this group includes a property tax, but its share in all paid taxes is insignificant – about 3.5%. A share of taxes paid "for employees" is also insignificant – this concerns an individual income tax and the payment of social contributions (this part approached 3% of the size of the value added by the end of the considered period or a little more than 6% of the share paid to the state). A profit tax, as contrary to a general opinion, does not occupy a considerable share in the total amount of the value added (in 2012 it was 7.9%). At the same time, the total amount of the paid profit tax is considerable – 301 milliard rubles. It may be noted that financial statements only disclose obvious contributions to the advantage of the state, alongside with that the Corporation itself was repeatedly used for political goals when various countries were periodically granted discounts for the gas, which were motivated by "political policy". A short-received income due to such actions may also be considered as a share of a "virtual" value added which is received by the state in the form of political capital. However, evaluations of such an income are a subject of a separate investigation. Also, we consider it important to emphasise that a considerable share of tax payments of the Gazprom Corporation may be invisible for the majority of researchers – a profit tax is only reflected in the traditional forms.

*Figure 3. The dynamics of the structure of the share of the Gazprom Corporation's value added, allocated to the advantage of the state in 2004-2012*

In more detail, the structure of the value added, which is at the disposal of the state, is presented according to types of taxes and payments in Fig. 4 (2004) and Fig. 5 (2012). It may be seen from the diagram, that the main share is occupied by customs payments (in 2004 – 42%, in 2012 – 36%), a share of VAT remained almost invariable – 15% in 2004 and 13% in 2012. A profit tax share increased from 11 to 15% and a severance tax share grew up from 13 to 22%. The last change is connected with an increase of a taxation rate, while the profit tax rate, on the contrary, decreased from 24 to 20%. Therefore, the growth of the share of this tax

(simultaneously, the absolute sum of the tax has also increased) may be explained by an essential growth of its base, that is to say, of profit. Changes in the share of other payments of the value added in favour of the state do not look considerable. Thus, the share of the state in the structure of the value added, if one speaks merely about taxes and customs payments, maintains steady positions - a steady level of 48%.

Owners of a corporation, among whom the central place is taken, again, by the state, appear to be second important "recipients" of a value added. In the present research, it is offered to abstract from the personification of owners and consider them as abstract entities with well-known interest in the form of maximising their share of a value added, i.e. their profit. During the whole considered period, despite a presence of some volatility, it is possible to notice a steady growth of owners' share. Beginning with 27% in 2004-2005, the owners' share fell just a little short of 40% in 2010 and 2011, while it made 33.8% in 2012 (Fig. 6). Simultaneously, one should note an insignificant growth of a share of part of the value added, consumed by owners, almost within the limits of a statistical error. However, in absolute terms, the sum of payments of dividends increased by 5 times – from 28.2 to 141.8 milliard rubles.

**Figure 4.** *The dynamics of the share of the Gazprom Corporation's value added, distributed in favour of owners in 2004-2012*

In addition, it should be noted that a consideration of a share received by the state as an owner of the Gazprom Corporation (50%), enables one to correct the above-given assessment of the share of the value added, appropriated by the state. In the aggregate, taxes, customs payments and a profit of a corporation permit the latter to derive up to 70% of a cumulative value added. And this share is practically invariable.

Employees of a corporation are a third important entity from the viewpoint of the appropriation of a value added. Their share is steadily reducing during the period from 2004 (13.8%) to 2012 (10.4%). In this respect, the share of managing directors increased from 0.028% (in 2004) to 0.040% in 2012 with an equal steadiness (Fig. 7). At the same time, an observed growth of an average salary is a consequence of both a reduction in the number of the employed, and a growth of the value added in absolute terms. The exposed reduction of a share of the employees in the gross value added of the Gazprom Corporation testifies to an alienation of the employees from the Corporation.

**Figure 5.** *The dynamics of the share of employees in the structure of the value added of the Gazprom Corporation in 2004-2012*

It is fair to say that "a peak" of the share of the value added at the disposal of managing directors already passed (in 2009), and a steady decrease of this indicator (from 0.055% to 0.040%) has been observed for 3 years. In absolute terms, the remuneration of managing directors grew during the considered period – from 0.22 to 1.43 milliard rubles a year. In this regard, in no one of the considered periods was a decrease of the sum of the remuneration observed, whereas in the recessionary 2009 a growth was by 20%. In addition, it should be noted that distinctions in the dynamics of shares of the remuneration of employees and managing directors permits to formulate a hypothesis of a strengthening of differentiation in payment for labour.

The smallest share (about 3%) falls on investors' share (primarily, banks), and in the "recessionary" years of 2008-2009 their share increased by more than twice, and then – it decreased again to 2.6%. The Gazprom Corporation do not stand in a great need of the use of loan capital (about 12.5% of the whole capital of the Corporation fell on its share in 2012, and in comparison with 2011 there occurs a decrease in this share).

## 4   Conclusions and Prospect Research

The presented conclusions only manifest the first view of the structure and distribution of the value added in the Gazprom Corporation. A more detailed analysis will permit to reveal in-depth contradictions between interests of various groups of the Corporation's entities, to understand the hidden mechanisms of the distribution of the value added as an objective characteristic of such a many-sided phenomenon in modern economy as the Gazprom Corporation. Moreover, the share of the value added at the disposal of one or another entity can show the real distribution of property rights better than other indicators. Proceeding from this statement, Gazprom belongs to the state in a scope of 70.05%; to private owners and institutional investors in a scope of 16.90%; to employees in a scope of 10.39%; to banks and other investors in a scope of 2.61%; and to top managers (managing directors) in a scope of remaining 0.05%. At first sight, a conclusion that employees' rights of the property of the Corporation by 200 times exceed those of its management, is absurd, but one should not forget that (a) the power of employees is diffused between them, and on the average less rights fall on one employee than on one top manager; and (b) theoretically, if one assumes an existence of the employees' integrated "intelligence" and their integrated volition, then, certainly, such intelligence and such volition will possess much bigger rights to the Corporation than its top management.

Some important advantages of the value-added-based indicator for such an investigation are its absence in data of accounting reports, and a present-day inattention to it on the part of investors, owners and other "controllers". For this reason, the calculation of the indicator in the course of an independent investigation gives the most objective picture which is not veiled by an aspiration for achieving a requisite result. In our opinion, this indicator should occupy a worthy place in scientific studies and expert estimates of the activity efficiency of managing entities.

# Does the Newly Shaping Structure in Energy Sector Mean a New Order for the World?

Asst. Prof. Dr. Onur Tutulmaz (Hitit University, Turkey)

## Abstract

The recent developments bring US to a major natural gas and oil producer position. The attempts in last 20 years to bring new horizontal drilling and hydraulic fracturing technologies together have developed a success in shale gas and oil production in US; the production volumes has reached to a position to redefine the market. Last estimations are bringing more information about the shale capacities of the major basins of the world. However, the estimates are based on a wide range of assumptions and consequently their results vary in a large scale. In any case, these developments have crucial economic, political and geopolitical consequences on the energy market, petroleum producer and consumer countries and regions. Despite the wide range of ambiguity of the estimated size of the resources, the estimations show US and North America has one of the biggest potential, already turning technology into the giant production numbers. Some of the estimations allege so big numbers can even mean to a new world order. The asymmetric nature of the potential, can also be said, increases some of the expected impacts too. In this study, basically, we want to supply an initial solid and economical evaluation to this ambiguity. We are trying to shape a frame for the new energy potential and to put it in a place in the current practice of the world. Secondly, in this context, we are underlying here some of the possible economic and geopolitical consequences each of which can constitute a subject of deeper study.

## 1    Introduction

When the reports of a 'new gold rush' started to be aired in 2011 (Economist, 2013, p.) it raised questions to what extent its size can reach. There are some voices that claim a big revolution for world economy with referencing the substantial oil and gas production rise has been experienced in USA (see, Morris, 2013; IEA, 2012). It is not easy to calculate how far the results of this new boom of energy production can be reach.

Energy has always been important for the economy and politics. There have been extensive political struggle for the energy reserves. The way of producing and consuming energy especially the fossil fuels which are highly dominant in the global economy and industry has been one of the important issues in this context. Economic development, technological innovations, industrialization and the new global issues (such as environmental issues) coming as its consequences have all mutual relationship with the energy concept; and make it more complicated and important for the current economic order of the planet.

Because the world economy is relying on mainly on the fossil fuels, the projection on its capacity or lifespan has been always important. Development and possible replacements of all other energy options, such as alternative and renewable energy, have been reckoned according to the availability and the capacity of the primary option.

Because of these reasons, any change in this structure will have butterfly effects to industries and economies. The production boom in US suggests that kind of change has been already happening right now. Its results are already started to change the energy structure in America. The projections show that USA is about to being the biggest oil producer in the world. This change came very fast. To that extend the ambiguity on the final shape of the changing picture is extremely large. For example, after seeing and evaluating the first years of the shale gas and oil boom, Lieber (2012) can foresee just a substantial reduction in oil imports of US; while, others such as EIA reports can mention about an energy independency or a net energy exporter status for US in near future (see, EIA, 2014). IER (2011) estimates even more excessive resources, extends this suggested energy independency up to the level of centuries. The one thing which is crystal clear is that the claims about the changing situation and its possible results need to be brought into academic discussion.

The mentioned estimates are not only to change the capacity profile of the primary energy source but also deem to change the whole energy perspective. To that extend it is expected to have most important effects on economic, political, geopolitical effects. In this paper, trying to draw a macro frame for the size of the new energy opportunity, we try to evaluate it in the present global energy picture and suggest or estimate an importance of it. Conducting this type of premier suggestion we also want to call for further studies on the very important sequential areas. Second section borders the global energy picture in which we will evaluate the importance of the new developments. Third section tries to give the notion on the origins of the new boom. Section four conducts the quantitative and economic evaluation. Fifth section concludes the paper.

## 2    Energy Structure of the World

The primal source of energy of the world comes from the sun. The total annual solar energy the earth is exposed to is approximately 5400 Q. The estimations about the amount of carbon processed via photosynthesis

show about 5x1010 tones equal roughly 20 Q energy. It equals roughly 0.4% of the earth's annual solar energy intake (Bolton, 1978, p.181).

Total world proved natural gas reserves have almost tripled (see, Figure) to 6793 tcf in last 30 years (OGJ, 2012). Similar discoveries have also happened for oil reserves updating the numbers upward in the history (for example US has so far consumed 2.5 times much of the oil that is predicted as its total reserves 30 years ago, see IER, 2011, p.1) Total world proved oil reserves are 1342 billion barrels (IER, 2011, p.2). We can add roughly 1000 billion short tons coal to this picture, almost half of the recoverable resources being in US. These reserves are predicted to have potential to enlarge from 2 to 70 times for the North America case (see, IER, 2011) using the new developing technologies; this last argument is rather disputable and is discussed in Section 4.

The world annual primary energy usage is over 500 quadrillion Btu for the year 2010 (EIA, 2012); with almost 1/5 of it belonging to US consumption alone. About a 4/5 of the primary energy consumption is met by fossil fuels.

*Figure 2. Variety in energy production in US, 1960-2040 (quadrillion Btu) **Source:** EIA, 2014*

As the numbers show that there is a big potential in terms of alternative energy resources. The environmental issues, national and international regulations will be the determining factor for this potential. On the top of that, there is technological factor changing all parts of this equation. It is highly possible that the increasing usage of the alternative and renewable energy sources might trigger further new technological developments in these areas. However, as can be seen in Figure 2, a dramatic change is not expected in energy production scales in 30 years.

In this global picture, a quick macro level calculation will show that the world's proven reserves can supply energy roughly for 40-50 years, without taking the new potential capacity into account. However, especially the short-term technical constraints and the 'peak oil' discussion on rising demand of oil shows the biggest pressure will be on oil supply part (for different views of discussion, see Hoong, 2012, pp.231-33; JFCOM, 2008, p.28; IEA, 2008). Regarding to that aspect, as Figure 2 and EIA predictions suggest, it can be expected a natural gas replacement to certain degree (see EIA, 2014, p.12-13).

## 3 Where Does Boom Come From?

Fossil fuels derive from decayed plant and animal matter trapped within the earth for hundreds of millions of years (Morris, 2013, pp. 18-19). Dead organic material accumulated under water and forms mud. Mud was compressed into sedimentary shale rock in time. This geologically slow process leads a transformation of the organic material to hydrocarbons, chains of carbon and hydrogen atoms.

Conventional oil reservoirs form if the liquid or gaseous hydrocarbons pass, by time, from the shale to a reservoir medium (or in some cases directly to the surface of the world). Shale rocks have been, however, stayed as unfeasible to exploit so far because they are generally formed as thin layers situated very deep in the earth.

The technological advancement to change this fact came by the private American engineering attempts that unite the new technological developments of directional drilling and hydraulic fracturing into a replicable final engineering solution for shale well drilling. An important stimulus for this success can be proposed as the private mineral right ownership in America: in America, different from the most of the countries, mineral rights are associated to the land and belong to landowners. As a result of this technology becoming available we have been experiencing a substantial increase in shale oil and gas production in America. Moreover, in the light of the new developments.

The similar technological developments also bring 3 other potential sources of unconventional gas and oil to the agenda: coalbed gases, oil sands and tight oil (oil shale). Some of them already started to be processed; however, they are not consisting comparable volumes as shale gas and oil is. Therefore, they are not assumed to either to have capacity to change the general picture of the global energy, nor are they calculated in the forecasts regarding to reckoning the new potential.

## 4   Evaluations of Potential

How big units we are talking about? What can be the economic value of this new imminent energy production boom? Of course, these questions depend on the quantitative estimations about the geological reserves and the qualitative estimations of these reserves. The quantitative estimations are not consistent and give a very cloudy picture us for the moment. In this scarcity of reliable data, for example, US Energy Information Administration's (EIA) estimations in same year, 2012, could be %50 different from each other. Having this in mind, we need to draw a quantitative and economic borders for the new energy opportunity we are being faced.

### 4.1   Technical Evaluations

The primary energy consumption of US is 95 quadrillion BTU per year and is predicted to grow 12% by the year of 2040. 82% of that consumption is coming from the fossil fuels and this proportion is expected to change by only a 2% decrease in next 30 years (EIA, 2014). The world's total primary energy consumption in 2010 is over 500 quadrillion BTU and almost the half of this consumption belongs to OECD countries. This consumption is predicted to increase to 820 quadrillion BTU and about 85% of it comes non-OECD countries, specifically China consists 40% of the total increase of primary energy consumption (EIA, 2013, Table A1).

So far, the consumption predictions are stable and seem having reliable projections in a viable range. The problem part lies in the resources part: the new shale drilling and fracturing technology created a new opportunity but the size of this potential is highly ambiguous. Below, we gave some examples of that variety.

**Figure 3.** *Natural Gas by Country (trillion cubic feet)* **Source:** *EIA, 2014*

**Figure 4.** *Oil by Country (billion barrels)* **Source:** *EIA, 2014*

Starting with the global proven capacity we pictured in section 2, we see that the world proved natural gas and oil reserves have reached the level of 6793 tcf  and 1342 billion barrels  respectively (see Section 2; Figure 3 & 4). USA had a 20 billion barrel proven oil reserves until a few years ago. After the new technology comes into the scene, IER calculates that the technically recoverable natural gas and oil resources of US are 2744 tcf and 1442 billion barrel respectively. ARI (2011) estimated the world recoverable resources of shale natural gas as 5760 tcf; ARI (2013) updated it to 6634 tcf for natural gas and 335 billion barrels for shale oil. EIA (2013) estimated 7299 tcf of gas and 345 billion barrels of oil. ARI (2013) estimates the US will have biggest share for

natural gas and second biggest share of oil in this total world potential: for shale natural gas and oil are 1161 tcf and 48 billion barrels respectively.

As we can see in a first glance, the capacity numbers for this new energy potential could by a factor of 2.5-3 times for gas and 28-30 for oil. The estimates and predictions are based on various assumptions. Therefore, this difference causes from several assumptions that the institutions take to conduct the estimations and predictions. First of all, based on the basin information institutes make a total resource potential prediction mainly based on assumptions. Secondly, the institution has to make an assumption on the percentage of this potential can be recoverable. These critical points seem to cause this wide range of variation in predictions. EIA's another assumption depending on the current technology is also shaping the forecasts by giving the advantage on the gas production side. Therefore, it seems that unless another technological development changes the situation, the gas production with shale production will be the dominant component in the energy forecasts.

Over 72% of petroleum are used in transportation vehicles and heating. Coal, natural gas and petroleum are currently responsible for 67% of global electricity production (ETC, 2011, p.59). These a few numbers can show how the current structure of the economy is directly depended to the fossil fuels. To change this dependency is the most important motive for the research and development activities on the alternative energy issues. However, the quick shifting efforts needs tremendous human intellectual capacity and come with the huge financial costs. Therefore, related with the new developments, a possible change in the perception of the emergency level of the need of any structural transformation will be crucially important for the future of all energy sectors.

### 4.2 Economic and Political Consequences

We can expect that there will be important consequences of any major technological shift in an important sector of the economy, especially if it contributes to understructures of other industries such as the energy sector. The most important results of the latest technological developments in the fracking and multidimensional drilling techniques can be pin down as economic, political and geopolitical. As for economic perspective, first of all, a huge economic potential has been revealed. It has already changed the macroeconomic calculations and predictions for USA economy. Just it was struggling the aftermath difficulties of the 2008 crisis, intellectual climate changed now calling to prepare itself to the next economic boom. This might continue in other geographies of the globe as the world's resources are being reevaluated; and also the updates in the prediction of the future of the world's biggest economy will change the predictions and near future plans of the other economies.

Another important economic change has come in terms of a change in comparatives in the energy economics. It is well known the reason that why hydrocarbons are being used as primary resource is their comparative cost advantage (Figure 5). The stimulus and investment budgets for alternative energy production have been based on mainly the idea of imminent scarcity of the fossil fuels as well as their adverse effects on environment primarily as carbon emissions. Therefore, any change in this perspective will change the projection on the spectrum once again.

**Figure 5.** *Total Levelized Cost by Energy Source*

As the determination of energy spectrum is based on national and central decisions, the new projections on the primary energy resources will change the all plans and projections on the other energy tools. Because energy

constitutes the main input of the manufacturing and transportation sectors, a change in energy macro-policies will also affect the investment decisions of these industries.

Another important effect can be classified as geopolitical change. The shale gas shift has not been obviously affect the other part of the world but even the changes have been happening (as well as the ones being projected) are enough to lead unprecedented changes in the international relations. America's imminent takeover the lead position in the energy production will make the continent energy independent. The shift of the world's biggest economy into the energy independent position means also a shift to political and geopolitical independencies because the relations of energy supply have been thought as the main factor in the geopolitics and international dependencies.

## 5  Conclusion

Some of the technological developments are brought together to shape this unconventional gas production boom we have been experiencing lately. The biggest effects so far have been in US energy production and US economy which was the start-off point itself; and it seems to continue growing. The predictions about the size of new potential vary from a capacity enough for few decades' consumption to one enough for more than century`s annual energy consumption of US. It apparently implies that a big change is imminent in a lot of area starting from the energy economics and comparatives to energy politics and geopolitics.

The wide range of the projections about its possible effects will be clearer with coming information. Hovewer, the situation especially in US seems the action speaks first, production numbers rise and the predictions come later following the new numbers and discovered potentials. In this situation, a possible cost-benefit evaluation for the other producers and potential investors stays ambiguous and not feasible forcing them to a waiting position in the reshaping market.

There is bigger uncertainty about the direct and indirect results of this new imminent boom on the other part of the globe. In this aspect, we can evaluate that the biggest effects will be on the Middle East and Central Asia that include the other main oil and gas producers.

# Decomposition Analysis of CO$_2$ Emissions for Turkey and Iran over 1990-2010

Ph.D. Candidate Hasan Rüstemoğlu (Eastern Mediterranean University, Cyprus)
Assoc. Prof. Dr. Sevin Uğural (Eastern Mediterranean University, Cyprus)

## Abstract

There exists an important awareness for reduction of CO2 emissions to obtain a sustainable world. Together with this, there is a great deal of interest for decomposition analysis to see the accelerating and decelerating factors of CO2 emissions. The aim of this project is to decompose CO2 emissions in economic sectors for the two superpowers of Middle East, Iran and Turkey, over the time period between 1990 and 2010, for Turkey obtained a rapid growth performance in recent years and Iran which is the energy superpower of the world. Refined Laspeyres Index decomposition method and a consistent data gathered from the World Bank's and UN's databases have been used during the analysis. Five main sectors (agriculture, manufacturing, transportation, construction and other service sectors) and four main impacts (scale effect, composition effect, energy intensity effect and carbon intensity effect) have been considered to see the increasing and decreasing factors of CO2 emissions. Various interesting results are observed for both of the countries, for each of the economic sectors. Generally scale effect and energy intensity effect are the dominant impacts for all sectors of both countries. However composition effect and carbon intensity effect are also important contributors for economic activities of these two countries. Overall, our analysis showed that these two countries should pay attention for energy intensity and sustainable economic growth.

## 1 Introduction

Environmental sustainability has been one of the most important issues on the world's agenda since the universe started to give the destruction signal. World population doubled in only 50 years. In 1960, it was around 3 billion; however, in 2005 it exceeded 6.5 billion. The world population increases, thus the need for water, food, energy supply and technical supply will also continue to increase. It is expected, by the end of 21$^{st}$ century world population will reach to 15 billion. Together with the rapid population growth, urbanization and industrialization will continue to increase. Therefore if serious environmental measures are not taken into consideration, it is possible to state that sustainability of the world will be in danger.

Together with the urbanization, energy demand will also continue to rise. In 2030, world electricity need expected to double as compared with today. Seventy eight percent of electricity consumption of the world still is generated by fossil fuels (WB, 2011). Fossil fuels are pollutant to environment and they are increasing the amounts of CO$_2$ emissions. CO$_2$ emissions are the main reason of global warming and the global warming is the greatest environmental problem of the world which creates danger for all living organisms.

Since the economic growth, environmental sustainability and energy efficiency are connected subjects, some of the developed countries being aware about this connection and they began to make huge investment on renewable energy sources. Despite, most of the developing countries still ignore the environmental sustainability. These countries are not voluntary to interrupt their economic growth by using renewable energy sources. Since renewable energy sources are relatively expensive than the fossil fuels, countries do not prefer to use them. Some of the developing countries (for instance, Iran) are very rich in terms of liquid and gas fuels and they use these fuels for their energy demand. However, some of the developing countries (for instance, Turkey) are located on the transition hub of these energy sources and they use these types of fuels, since these fuels are relatively cheaper than the renewable sources and they are also portable.

The cases of Iran and Turkey are quite interesting since Iran is an energy superpower in the world and carefully monitored by other countries. Furthermore, Turkey is located on the energy transition hub between Europe and Middle East and Caspian Region. Both of the countries obtained remarkable growth performance in the last two decades. For instance, Iranian GDP is 4.4 times greater than in 2011 ($514 billion) as compared with 1990 level ($116 billion). Correspondingly, Turkey's GDP is 5.1 times greater in 2011 ($774 billion) as compared 1990 level ($150 billion). During the last twenty years both the countries showed rapid population growth. In 2011, Iran's and Turkey's population reached to 75.4 million and 73 million, respectively. Another important basic economic indicator is GDP per capita and it is approximately equivalent to $6800 and $10600 for Iran and Turkey, in 2011, respectively.

Iran is a huge energy consumer, located at position 12 of World Bank's energy consumption ranking. According to the same database, the recent overall energy consumption of country is approximately 211 thousand kt of oil equivalent and this value is 3 times greater than 1990 consumption level. On the other hand, Turkey is located at position 23 of World Bank's energy consumption ranking. Turkey's overall energy consumption is estimated around 105 thousand kt of oil equivalent in 2011. This energy consumption amount is

almost twice if one compare with 1990 level. Both Iran and Turkey are certain electricity consumers of Middle East. Iranian electricity production is estimated as 233 billion kwh and electricity consumption is estimated as 196 billion kwh (WB, 2010). For Turkey, overall electricity production and consumption values are estimated as 211 billion kwh and 180 billion kwh, respectively. Iran is able to meet its domestic electricity demand and also exports electricity to its neighbor countries. The customers of Iranian electricity are Armenia, Iraq, Afghanistan, Pakistan and Turkey. Approximately 95 percent of electricity in Iran is generated from thermal electricity sources and remaining 5 percent is generated from hydro and renewable sources. Seventy four percent of electricity in Turkey is generated from thermal electricity sources and remaining 26 percent is generated from hydro and renewable sources (WB, 2010). In the light of this information $CO_2$ emissions are on an incredible level, especially for Iran. In 2010, overall $CO_2$ emissions of Iran are more than 571 thousand kt and country located at position 7 in the world $CO_2$ emissions ranking. For Turkey, in the same year overall $CO_2$ emissions are estimated as 298 thousand kt and the country is located at position 21 in the same ranking. Accordingly, $CO_2$ emissions metric ton per capita is equivalent to 7.67 and 4.13 for Iran and Turkey, respectively. Overall, it is possible to state that Iran is a serious pollutant for the world. Turkey is not at the same level but its environmental damage is also increasing.

Iranian economy suffers from the sanctions of the world countries. However, external dynamics are not the only problems of Iranian economy. Internally, country has a serious energy efficiency and wastage problem. Together with this, high subsidies on energy sources create problems on Iran. Iran is a very rich country in terms of energy sources, however plenty number of years it had to import sources from other countries in order to meet high energy demand. Energy prices (especially for gasoline) are generally subsidized and this resulted the over use of energy sources. For the next following years government plans to decrease the amount of subsidies to discourage wage. Reduction of subsidies contains both petroleum and natural gas.

Turkey's importance in the energy markets is growing, both as a regional energy transit hub and as a growing consumer. Turkey's energy demand has increased rapidly over the last few years and likely will continue to grow in the future (EIA). During the recent years Turkey showed fastest increase in energy demand in OECD countries. Turkish economy has avoided from the long stagnation that affected negatively the European OECD countries. Real GDP growth rate for Turkey is estimated as 9.2%, 8.5% and 2.6% for the years 2010, 2011 and 2012, respectively. In the last two decades Turkey suffered from four different economic crises. These crises happened in the years 1994, 1999, 2001 and 2008 respectively. Turkey's energy use is still relatively low, despite it is growing at a very fast pace. Since the domestic energy sources are very limited Turkey mostly relies to the imports of these sources. Turkish government is voluntary to use nuclear sources to reduce the dependence of country. However, there is a debate about the nuclear sources since the sources are risky.

For the internal energy and related $CO_2$ emissions dynamics, doing a decomposition analysis might be helpful in terms of environmental sustainability and efficient energy use. Both of the countries have the potential to solve their energy over use problems and reduce the $CO_2$ emissions. This type of decomposition analysis will also emphasize the energy intensive and carbon intensive sectors of Iran and Turkey. A decomposition analysis also gives valuable insights for solving the energy concerned issues of these two countries.

In this project the main purpose is making a decomposition analysis for Iran and Turkey between 1990 and 2010, according to five main economic sectors, agriculture, manufacturing, construction, transportation and other services. Refined Laspeyres Index decomposition method and a consistent data set gathered from World Bank and United Nations energy databases have been used. Four main effects have been considered to see the accelerating and decelerating factors of $CO_2$ emissions. These effects are, scale effect, composition effect, energy intensity effect and carbon intensity effect.

## 2 Literature Review

For the concern of decomposition analysis, researchers generally followed two different ways. Some of them either did a comparison analysis between the decomposition methods or they computed some extensions according to available methods to minimize the residual terms and obtain a better approach. Furthermore, in the second category, some researchers used the available decomposition techniques to analyze the increasing and decreasing factors of $CO_2$ emissions of countries according to economic activities.

Ang et al. (2003) discussed the perfect decomposition techniques for energy and environmental issues. The authors clearly stated that they extended the work of Albrecht et al. (2002) by giving a more complete and up to date overview of perfect decomposition techniques and their role in energy demand and related analysis. The main reason behind of their work is there has been a great deal of interest in decomposition analysis in energy policy studies.

Ang et al. (2004) obtained a general Fisher index approach to energy decomposition analysis by extending the conventional two-factor fisher index decomposition approach to n factors. After their work the authors obtained a complementary approach for the current methodology. The new approach possesses some desirable properties

and it may used for some important analysis in energy studies. The authors also emphasized that the new formula is more complicated than the other commonly used Index Decomposition Analysis (IDA) approaches.

Liu (2006) did a comparison analysis for methodologies related with the decomposition approach based on energy consumption. Considering the size of residual term as a comparison tool, Liu concluded the adaptive weighting Divisia index method and simple average Divisia index method show the most robust and smallest residual term.

Paul & Bhattacharya (2003) analyzed the factors that are accelerating or decelerating $CO_2$ emissions emitted from the energy use of India between 1980 and 1996. The authors used decomposition method and they analyzed four main impacts such as, pollution coefficient, energy intensity, structural changes and economic activity to describe the changes in $CO_2$ emissions. Using the decomposition method authors proved that economic growth has the largest positive impact on $CO_2$ emissions change, for all important economic activities. There exists a decline for $CO_2$ emissions obtained from industrial sectors and transportation because of the increasing energy efficiency and fuel switching. The authors also emphasized the decrease due to the pollution coefficient and energy intensity effect for agriculture can be ignored. They finally concluded that the energy intensity has had a greater impact on energy induced $CO_2$ emissions compared with the pollution coefficient.

Comille & Frankhauser (2004) decomposed the energy data to determine the main factors (contributors) behind the improvements in energy intensity. They concluded that energy prices and progress in enterprise restructuring are two more important factors for more efficient energy use. The authors also emphasized that the economies of Central and Eastern Europe and the former Soviet Union countries are very energy intensive. They also clearly stated that there exists a decline for energy intensity during the period of transition. However, the transition countries are still highly energy intensive.

Kawase et al. (2005) examined the long-term scenarios for other countries and the medium-term scenarios for Japan in order to construct Japan's long-term climate stabilization scenario. Using the extended Kaya Identity the authors decomposed the $CO_2$ emissions according to following indexes: $CO_2$ capture and storage, carbon intensity, energy efficiency, energy intensity and economic activity. They also evaluated a Reduction Balance Table for $CO_2$ emissions. The authors also calculated the necessary improvement for energy intensity and carbon intensity decline to reach the goal, i.e. obtaining 60-80 percent reduction for $CO_2$ emissions.

Ma & Stern (2007) used the logarithmic mean Divisia index method to analyze the factors related with changing energy intensity trends of China for the time period between 1980 and 2003. They reported that the technological change is the major factor for decreasing energy intensity. Together with this the structural change for industry sector increased the energy intensity during the same period. Structural change considers shifts of production between sub-sectors and it represents a declining trend for energy intensity. They also stated that the reason of increasing energy intensity after the year 2000 is the negative technological progress. Finally, the inter-fuel substitution is a small factor for changes in energy intensity.

Vinuya et al. (2010) decomposed the $CO_2$ emissions growth in US according to states between the years 1990 and 2004. The authors used the logarithmic mean Divisia index (LMDI) method to decompose the emissions according to five impacts. These effects are emissions per unit of fossil fuel, share of fossil fuel in total energy consumption, energy intensity, gross state product per capita and population. Their analysis proved that, during the research period there is an increase in energy efficiency. Together with this, lowering the share of fossil fuels in overall energy consumption and lowering the emissions intensity, balances the increasing impact of GDP per capita and population growth on carbon emissions for US.

Kumbaroglu (2011) made a decomposition analysis about $CO_2$ emissions for Turkey for time period 1990-2007 according to main economic activities, agriculture, manufacturing, electricity, residential buildings and transportation. The author analyzed four main impacts on $CO_2$ emissions by using the refined Laspeyres index method (RLI). The analyzed impacts are, scale effect, composition effect, energy intensity effect and carbon intensity effect. The author clearly stated that various interesting results on the underlying effects of economic activities emission data are found. Kumbaroglu also stated that valuable insights that are gained into $CO_2$ impacts of sector policies including energy and emission intensities, fuel switching and activity changes.

The purpose of this study is to analyze the major and minor impacts of $CO_2$ emissions for Iran and Turkey between 1990 and 2010 according to five main economic sectors. These sectors are agriculture, manufacturing, construction, transportation and other services. Four main effects, namely, the scale effect, energy intensity effect, composition affect and the carbon intensity effect will be considered. For the decomposition analysis Refined Laspeyres Index Method and a consistent data that is gathered from World Bank's and United Nation's databases will be used.

## 3   Data and Methodology

Structural Decomposition Analysis (SDA) and Index Decomposition Analysis (IDA) are the two widely used methods for decomposing the indicator changes according to sectors. SDA is related with the input output

model of quantitative economics and its theoretical foundations and major properties are discussed by Rose and Casler (Kumbaroglu, 2011). For decomposition analysis IDA methods are generally used. Because of this it is possible to apply IDA methods for any data at any level of aggregation. The well known Laspeyres index method isolates the impact of a variable by letting that specific variable to change between two years while holding other variables constant at their base year values (Kumbaroglu, 2011). Various methods have been developed and employed under IDA methodology (Kumbaroglu, 2011). In 2000, Ang and Zhang provided a survey about the index decomposition analysis. Refined Laspeyres Index (RLI) method is derived from Laspeyres Index Method by Ang and Zhang. The main feature of method is, it distributes the residual term evenly to each variable. The RLI method has some advantages such that, it is not difficult to apply and understand. Ang and Zhang did some comparison about the IDA methods and they stated that RLI method is time reversal, factor reversal and it also passes from the zero value robustness test. For this study we used the RLI method to decompose the CO2 emissions of Iran and Turkey. The method is based on the Kaya Identity, which is mainly used to analyze the role of different factors, which also influences the CO2 emissions. The Kaya Identity defines carbon emissions (C) as the multiplication of four different effects: population (POP), carbon intensity of energy use (C/E), energy intensity of production (E/P) and per capita production (P/POP). Mathematically, it is represented as,

$$C = POP * \frac{C}{E} * \frac{E}{P} * \frac{P}{POP}$$

For this study our aim is to show the impacts at subsectors level, therefore, $CO_2$ emissions are represented as the multiplication of the sub-sectored total of four effects such that:

$$CO_{2i}^t = P_i^t * \sum_j \frac{CO_{2j}^t}{E_j^t} * \frac{E_j^t}{P_j^t} * \frac{P_j^t}{P_i^t}$$

where $\frac{co_{2j}^t}{E_j^t}$ shows the carbon intensity of energy use in subsector j at time t, $\frac{E_j^t}{P_j^t}$ is the energy intensity of production in subsector j at time t, and $\frac{P_j^t}{P_i^t}$ is the share of subsector j within sector i, at time t and it is possible to denote the carbon intensity by CI, the energy intensity by EI and the sectors share by SS. Then the previous equation can be written as;

$$CO_{2i}^t = P_i^t * \sum_j CI_j^t * EI_j^t * SS_j^t$$

The effect of changes in production activity which is referred to as scale effect and it can be calculated as:
Scale Effect ($P_i^t$)

$$= \Delta P(i) \sum_j \left\{ SS(j)EI(j)CI(j) + \frac{1}{2} * \left( \Delta SS(j)EI(j)CI(j) + SS(j)\Delta EI(j)CI(j) + SS(j)EI(j)\Delta CI(j) \right) \right\}$$

$$+ \Delta P(i) \sum_j \{ \frac{1}{3} * \left( \Delta SS(j)\Delta EI(j)CI(j) + \Delta SS(j)EI(j)\Delta CI(j) + SS(j)\Delta EI(j)\Delta CI(j) \right) + 1/4$$

$$* \left( \Delta SS(j)\Delta EI(j)\Delta CI(j) \right) \}$$

First effect is the scale effect and it shows the change in $CO_2$ emissions are resulted from the changing activity levels. According to the scale effect, the increase of activity levels increases the amount of $CO_2$ emissions and the decrease of activity levels decreases the amount of $CO_2$ emissions.

Composition Effect ($SS_j^t$)

$$= \sum_j \Delta SS(j)\{P(i)EI(j)CI(j) + \frac{1}{2} * \left( \Delta P(i)EI(j)CI(j) + P(i)\Delta EI(j)CI(j) + P(i)EI(j)\Delta CI(j) \right)\}$$

$$+ \sum_j \Delta SS(j)\{ \frac{1}{3} * \left( \Delta P(i)\Delta EI(j)CI(j) + \Delta P(i)EI(j)\Delta C(i) + P(i)\Delta EI(j)\Delta CI(j) \right) + 1/4$$

$$* \left( \Delta P(i)\Delta EI(j)\Delta CI(j) \right) \}$$

Composition effect shows the change of emissions resulted from the changes in the composition of sector. A structural change toward less carbon intensive subsectors decreases $CO_2$ emissions and a structural change toward more carbon intensive subsectors increases $CO_2$ emissions.

Energy Intensity Effect ($EI_j^t$)

$$= \sum_j \Delta EI(j)\{P(i)SS(j)CI(j) + \frac{1}{2} * \left( \Delta P(i)SS(j)CI(j) + P(i)\Delta SS(j)CI(j) + P(i)SS(j)\Delta CI(j) \right)\}$$

$$+ \sum_j \Delta EI(j)\{ \frac{1}{3} * \left( \Delta P(i)\Delta SS(j)CI(j) + \Delta P(i)SS(j)\Delta CI(j) + P(i)\Delta SS(j)\Delta CI(j) \right) + 1/4$$

$$* \left( \Delta P(i)\Delta SS(j)\Delta CI(j) \right) \}$$

Energy intensity effect suggests an indication for efficiency of energy process, conversion technologies and energy conservation. Energy saving activities, reducing the use of fossil fuels and use of renewable technologies increases the energy efficiency. Energy efficiency will reduce the amount of $CO_2$ emissions.

Carbon Intensity Effect ($CI_j^t$)

$$= \sum_j \Delta CI(j) \left\{ P(j)SS(j)EI(j) + \frac{1}{2} * \left( \Delta P(i)SS(j)EI(j) + P(i)\Delta SS(j)E(j) + P(i)SS(j)\Delta EI(j) \right) \right\} +$$

$$\sum_j \Delta CI(j) \{ \frac{1}{3} * \left( \Delta P(i)\Delta SS(j)E(j) + \Delta P(i)SS(j)\Delta EI(j) + P(i)\Delta SS(j)\Delta EI(j) \right) + \frac{1}{4} * \left( \Delta P(i)\Delta SS(j)\Delta EI(j) \right) \}$$

Carbon intensity effect is used to show the impact of fuel substitution on $CO_2$ emissions. For instance, if the share of renewable resources increases or if people use natural gas instead of coal, there will be a certain decline in overall $CO_2$ emissions. The change of $CO_2$ emissions between two time periods is the sum of these four effects.

$$\Delta CO_2(i) = Scale\ Effect\ (i) + Composition\ Effect\ (i) + Energy\ Intensity\ Effect\ (i)$$
$$+ Carbon\ Intensity\ Effect\ (i)$$

For the detailed analysis about the RLI method it is appropriate to follow the work of Ang and Zhang, called Methodological Issues in Cross-Country/Region Decomposition of Energy and Environment Indicators.

## 4   Empirical Results for Iran

### 4.1 Agriculture

For the agriculture sector of Iran, the most determining effect appears to be the scale effect. In the early 1990s scale effect shows a negative impact for overall agricultural emissions. Because of this, there was a decline on overall GDP of country, just after the Iraq war. After 1993, generally the scale effect shows a positive impact on $CO_2$ emissions. Around 2009 and 2010, scale effect shows a declining trend because there are heavy sanctions on Iranian economy. Energy use for agriculture sector, increased rapidly during the research period. In 2010 the total energy use in agriculture is 4.4 times greater than 1990 level. Energy intensity generally declines for agriculture while scale effect increases. However, on average energy intensity is positive for agriculture. Carbon intensity effect generally shows a negative trend for agriculture.

*Figure 1. The decomposition of agriculture sector for Iran between 1990 and 2010*

*Figure 2. The decomposition of manufacturing sector of Iran between 1990 and 2010*

### 4.2 Manufacturing

For manufacturing, scale effect and energy intensity effects are the two major impacts that are affecting $CO_2$ emissions. Scale effect generally shows a positive impact on emissions except the years 1991, 1993, 1997, 1999 and 2009. Manufacturing GDP of Iran increased by 114% during the research period. Energy intensity effect is on the opposite direction with scale effect. On average it shows a negative impact on emissions. Despite its slow

growing technology, negative energy intensity impact implies that Iran obtained some energy intensity. Composition effect is a minor positive contributor of emissions, since the share of manufacturing GDP increased slightly in secondary industry. The negative minor impact of Carbon intensity effect for manufacturing also can be ignored.

### 4.3 Construction

The scale effect shows a positive impact on overall emissions, except the years 1991, 1993, 1997, 1998, 2000 and 2009. Overall construction GDP declined in these years. However, on average, scale effect is positive. Construction GDP is almost 4.1 times greater than 1990 level, in 2010. Energy intensity effect is negative for construction sector. However, it is positive on the years when GDP for construction decreased. Despite the energy use of construction sharply increased, it is possible to state that in the periods of recession, the resource management is also a problem for country. Carbon intensity effect is also an important contributor of $CO_2$ emissions for construction and it shows a negative trend on average. The share of construction GDP slightly decreased in secondary industry; however the small implication of composition effect can be neglected.

*Figure 3. The decomposition of construction sector for Iran between 1990 and 2010*

### 4.4 Transportation

During the twenty years of research, scale effect has a positive trend for transportation. This result is not a surprising result, since the GDP for transportation 4 times greater than its 1990 level, in 2010. Energy intensity effect is negative on average. However in most of the years the impact of energy intensity is positive, since the overall energy use of transportation sector is 12.4 times greater than 1990 level, as of today. Transportation is one of the most energy intensive sectors of Iranian economy. Carbon intensity effect is a minor determinant of the sector. Therefore its relatively small negative impact can be ignored. The share of transportation GDP increased between 1990 and 2010 through tertiary industry, thus the composition effect is positive for the sector.

*Figure 4. The decomposition of transport sector for Iran between 1990 and 2010*

*Figure 5. The decomposition of other services for Iran between 1990 and 2010*

### 4.5 Other Services

For the service sector, energy intensity effect and scale effect are the main determinants of increasing $CO_2$ emissions and they are both positive on average. GDP of other services is 2.3 times greater in 2010 as compared with the 1990 level. Overall energy use increased amazingly during the research period. It increased by 792 percent between the years 1990 and 2010. This is due to the huge consumption of electricity and heating in residential buildings in Iran. Carbon intensity effect shows a remarkable negative impact on overall emissions and it has a negative trend almost in every year of last two decades. There is a small negative composition effect of other services since the share of sector slightly decreased in tertiary industry.

## 5    Empirical Results for Turkey

### 5.1 Agriculture

For the agriculture sector of Turkey, dominant effects are the energy intensity effect and scale effect. Scale effect (also we can call it as GDP effect) is generally a positive contributor for CO2 emissions of agriculture, except the years 1994, 1997, 1999, 2001 and 2009. In these years there exists a decline on agricultural GDP. These years are also the years that country faced with recession. Therefore a negative scale effect is expected and it is consistent. Energy intensity effect is generally positive for agriculture during the first decade. Energy Intensity effect is negative except only some of the years of the second decade. However, on average energy intensity effect is positive. Carbon Intensity effect has some minor contributions to overall estimated CO2 emissions, if one compare with the other effects and these contributions are mostly negative during the research period. There is no composition effect since we considered the agriculture sector as a whole of primary industry.

*Figure 6. The decomposition of agriculture for Turkey between 1990 and 2010*

### 5.2 Manufacturing

Since Turkey has a great manufacturing capacity, then a positive and huge scale effect is not a surprising result. Except the years of crises (1994, 1999, 2001 and 2009) Turkey's manufacturing GDP just increased in every year between 1990 and 2010. Therefore, a positive scale effect from manufacturing is expected and it is consistent. Overall; the manufacturing GDP is almost 4 times greater in 2010, as compared to 1990 level. Energy Intensity is the second dominant factor for manufacturing emissions. However, on average, it shows a negative trend during the last two decades. Especially on these years that scale effect is positive, then energy intensity has a negative impact on overall emissions. Overall energy consumption for manufacturing industries is approximately 3 times greater in 2010, as compared with 1990 level. Therefore it is possible to state that GDP increased with a faster pace if we compare with energy increase for manufacturing. Compared with the total energy use of manufacturing, $CO_2$ emissions increased with a slower pace. Especially in the second decade, Turkey began to use gas fuels with an increasing rate, thus, Carbon Intensity effect generally shows a negative impact on $CO_2$ emissions. Since the share of manufacturing showed a small decrease in secondary industry, a minor negative composition effect is expected and it is observed.

*Figure 7. The decomposition of manufacturing for Turkey between 1990 and 2010*

### 5.3 Construction

During the last two decades, construction GDP of Turkey, showed a remarkable increase and in 2010 it is estimated at 4.26 times greater than 1990 level. Generally, the scale effect has a positive contribution to overall emissions, except the years of crises. Recessions showed their negative impact on construction sector profoundly. Although energy intensity is mostly negative, in the years of crises (when GDP decreases, sharply) there exists a positive energy intensity effect. The positive energy intensity effect also proves that in recession periods certain energy wastage occurs. For construction a positive composition effect has been observed during the studies. Because of this the share of sector increased in secondary industry. Finally the carbon intensity effect has some negative minor impacts on emissions for construction sector of Turkey.

*Figure 8. The decomposition of construction for Turkey between 1990 and 2010*

### 5.4 Transportation

Scale effect represents a positive contribution to $CO_2$ emissions derived from transportation, since the GDP for transport sector in 2010, is nearly 6.6 times greater than its 1990 level. Only in some years (1994, 2001 and 2009) scale effect for transportation is negative because these years country faced with crises. The other economic activities affected negatively in 1999 crises, because in that year an earthquake happened. However, the earthquake did not affect transportation sector abnormally. Energy intensity effect is generally negative, because people started to use more economic cars as technology improved. Another main reason for negative energy intensity is that as the gasoline and diesel prices increased rapidly, people started to use alternative ways of transportation especially in the large cities. Carbon intensity effect is generally negative since people started to use less consuming LPG cars. Finally composition effect is small and positive for transportation, since the share of this sector increased in tertiary industry, especially in the first decade.

*Figure 9. The decomposition of transportation for Turkey between 1990 and 2010*

*Figure 10. The decomposition of other services for Turkey between 1990 and 2010*

**5.5 Other Services**

Scale effect is positive for other services, on average. This is not a surprising result since the GDP for other services is 6.3 times greater in 2010 if one compare with the 1990 level. GDP declined in the years 1994, 2001 and 2009 therefore in those years scale effect is negative. Second dominant contributor is the carbon intensity effect. Because by starting mid 90s Turkey began to use natural gas instead of coal for domestic heating purpose. Carbon Intensity is negative on average, since natural gas is relatively a cleaner fuel than coal. Energy Intensity is the third greatest contributor to emissions obtained from other services, and it is positive on average. This also proves that country has some energy wastage issues on service sector. Finally there exists a minor contribution from composition effect of service sector to emissions, which can be ignored.

# 6 Conclusion

For this project, the $CO_2$ emissions of two super powers of the Middle East, Iran and Turkey, are decomposed according to five main economic activities, namely, agriculture, manufacturing, construction, transportation and other services. Four main impacts (scale effect, composition effect, energy intensity effect and carbon intensity effect) and refined Laspayres index method has been considered during the analysis. Various interesting results and remarkable insights are observed.

Iran is an upper middle income developing country and at the same time it is the energy superpower of the world. The country relies on the revenue that gathers from energy sources. However, international sanctions show their negative impact on country's energy sector and after 2008 Iranian economic growth slowed down. Moreover, in 2012 country faced with a recession. Despite external problems, Iran has a certain energy wastage problem. Since the huge amount of energy is subsidized by government, then the overall energy use of Iran is high and this lead to an increase on $CO_2$ emissions. Together with this, country is very rich in terms of energy sources; therefore the citizens are not voluntary to use renewable energy sources. In the winter months, the natural gas demand reaches its peak and in order to meet with this high demand Iran imports natural gas from its neighbors. Iran also has a controversial nuclear energy program.

Turkey obtained a significant economic growth performance especially in the last decade. Therefore country's energy use increased very rapidly. Since the domestic energy sources are very limited, Turkey is a huge importer of oil and natural gas. Mainly, Turkey imports its energy from Russia and Iran. However, Turkish government plans to reduce the energy dependence of Turkey, therefore the new aim is generating electricity from nuclear sources. Furthermore, there is a debate on Turkish public about the riskiness of nuclear energy. Instead of nuclear energy most of the authorities suggest renewable energy sources such as wind and sun. Especially Turkey has some wind and solar energy potentials as a result of its geographic location.

Our study showed that scale effect and energy intensity effect generally plays an important role of emissions decomposition, for both of the countries, almost for all the economic activities. Since the GDP of both countries showed a remarkable increase, a dominant scale effect and energy intensity effect are expected. Carbon intensity effect plays a minor role for decomposition of emissions. The composition effect also plays a minor role about the decomposing the emissions for secondary and tertiary industries. Manufacturing, transportation and other services are the sectors that have leadership about the huge scale effect and energy intensity effect. Therefore, increasing energy efficiency (i.e. being more productive with less energy) in manufacturing, fuel switching for transportation (i.e. using electricity cars instead of gasoline and diesel cars) and generating residential electricity from sun and wind instead of natural gas and coal will be an efficient energy policies to reduce the carbon emissions. For Iran, it will be also beneficial if the government reduces the energy subsidies.

# Recent Energy Policy Regulation on Solar Energy Systems in Turkey: Impact on the Economy and the Environment

Mehmet Güneş (Adana Science and Technology University, Turkey)
Asst. Prof. Dr. Mustafa Güneş (Adana Science and Technology University, Turkey)

## Abstract

The main objective of this report is to give detail information regarding the capacity of Turkish electricity market as well as taking into consideration the country's economic situation all over the world. Following by this, the demand and consumption of Turkey's electricity capacity is given by associated with its economical growth and dependence on energy from abroad. It is pointed out that Turkey is the one of the biggest fossil fuel consumers. The fact of the time line of Turkey's energy status is highlighted by given actual data comparing last three decades. The effect of utilizing of fossil energy source on country's economical and environmental welfare is discussed. There is a wide consensus on existing un-reversible climate change due to increased $CO_2$ emissions so in order to reduce emission the benefit of utilizing solar energy system is explained in accord with country's solar energy policy up to date as well as additional incentives granted by Turkish government for installation. The country great solar energy potential and installed photovoltaic capacity are also given by comparing other countries.

## 1   Introduction

Turkish electricity market is one of the most promising markets in Europe. Turkey's economy has been developing significantly for the last years. From economical point of view Turkey is considered to be 17th biggest economy all over the World and as given in Figure 1 (Arıkanlı Holding Presentation, 2012). Next 15 years with 6.7 % GDP (Gross Domestic Product) growth forecast Turkish Economy will be the fastest growing economy among the OECD (Organization for Economic Co-operation and Development) countries (see Figure 2). According to report published in 2012, it is the fastest growing third economy following China and Argentina, the sixth biggest economy of Europe, the biggest sixth electricity market of Europe. The demand on annual electricity has been increasing 6-7 % every year and 4.6 % average demand since 1990 which is 3 times more than Europe's average 1.6 %. It has been anticipated that by 2020 the demand on annual electricity will be increased by 7.5 % (Chamber of Mechanical Engineering Overlook of Turkey's Energy Profile, 2012). In the current situation, Turkey is one of the biggest fossil fuel consumers. The rank of consumptions can be given as follows; the seventh biggest coal, eight natural gas and twenty-fifth petroleum importation of the World. Consumption in fossil fuels induces two negative effects on economy and environment. From economical point of view energy imports of Turkey in 2012 amounted to $ 60 billion which corresponds to 2/3 of the country's current deficits, and is estimated to reach U.S. $ 120 billion in 2023. 2011 to 2012 has been an increase of 12.3 % in the cost of imported energy. Investors and governments which play important role in directing the economic growth especially in developing economies neglect the environmental issue as a result of using fossil fuels (Alawaji, 2001). There is a wide consensus on existing about un-reversible climate change due to use of classical energy resources (Badran, 2001).

*Figure 1: World's Biggest Economies GDP Millions of '000 USD*
*Figure 2: Annual Average Real GDP Growth (%) Forecast in OECD Countries 2011-2017*

The new policy should be introduced in order to regulate $CO_2$ emission (World Bank Annual Report, 2013). Otherwise releasing emission will lead to global temperature increases that are measured about of 3.6 $^0$C for this century as well as sera effect, acid rain and dirty fogs (Lehtovaara, et. al, 2013). These issues can be solved by shifting use of sustainable renewable energy resources limiting the global warming and countries' deficits. Huge amounts of investments for energy production has been made between 2004 and 2011 reaching USD 260 billon with 30 % annual increment (World Bank Annual Report, 2013).

In this work, the case study has been conducted on renewable energy potential of Turkey as well as how the diffusion of solar energy efficiently promoted in Turkey. The main focus of the study is on recent and future expectation of solar power that is expected to contribute the biggest share of the increase of renewable energy in Turkey. Turkey's solar power production and installation performance is determined and is compared with the other countries.

## 2 The Timeline of the Turkey's Energy Status

Turkey is a founding member country of International Energy Agency (IEA) among 28 member countries. To be a member country of the IEA, a country must be a member country of the OECD. However, membership in the OECD does not automatically result in membership in the IEA. For instance, Chile, Estonia, Iceland, Israel, Mexico and Slovenia are OECD Member countries but currently not IEA Member countries. Chile and Estonia, however, are currently candidate countries of the IEA. The main benefit of being part of such organization is to create sufficient condition in energy sectors and obtain sustainable economic development and environment. To achieve such goals and enter international energy markets, IEA ministers congregate once every two years at IEA Ministerial Meeting. During the IEA Ministerial meeting the issues come along according to the member country's priority about energy and ideas for existing or new work programmers (Energy Policy Highlights, 2013).

Improving energy efficiency is essential for responding to Turkey's energy policy challenges and considerable potential in all sectors. In a country like Turkey where private sectors are rapidly becoming more common and where significant new construction is foreseen, transport and buildings related energy consumption is significantly increased inducing $CO_2$ emissions. Energy-related $CO_2$ emissions in Turkey have more than doubled since 1990 and are likely to continue to increase rapidly over the medium and long term, in parallel with energy demand. The IEA urges Turkey to intensify efforts to further develop its approach concerning its post-2012 regime to combat climate change, and to consider setting a quantitative overall target for limiting emissions. Table 1 shows present and future estimated energy balances and key statistical data in Turkey between 1973 and 2020. In the same table, the amount of each production supply such as coal, oil, gas are compared to show tendency of usage trend. As it is seen that the total energy productions in Turkey are estimated to be 65.99 Mtoe by the year 2020. However, total energy consumptions are estimated to be 163.26 Mtoe by the year 2020 as seen in Table 2.

Total net imports compared to exports in coal, oil, gas are significantly increased year by year which makes Turkey energy depend country. Turkey depends on imports for 72 % of its total primary energy supply (TPES) that can be accounted as mainly oil and natural gas and coal. Oil, coal and natural gas together held 30 % of the total while renewable energy sources is less than 10 %. According to IEA report regarding Turkey's energy potential, the increase in TPES more pronounced by only two fuels; natural gas and coal which are 18 Mtoe and 7 Mtoe, respectively since 2000 (International Energy Agency Report, 2009). However, the other energy sources have not showed significant change although the economic development. Since natural gas and coal are used as

one of main sources for power generation for last two decades, 48 TWh which corresponds to 72 % of total power generation between 2000 and 2010 while 17 TWh are provided from coal. Energy production based on oil-fired has been steadily decreased since 2002 while Hydropower generation tends to increase by 5 TWh from 2000. Turkey has made huge investment on nuclear power so the total energy production form nuclear sources are going to be increased by 2020 up to 8 Mtoe. On the other hand, renewable energy sources such as wind, solar energy production are expected to increase by 3.64% and 4.28% which is not enough to provide Turkey's energy demand as it is estimated to be 250 Mtoe (International Energy Agency Report, 2009).

***Table 2**: Final Consumption By Sector (Unit: Mtoe)* **Source***: International Energy Agency*

Turkey's total final consumption of energy (TFC) is increased by 86 % between 1990 and 2008 and intend to increase by 2020 reaching 163.26 Mtoe. According to IEA Turkey report published in 2009 (International Energy Agency Report 2009) Industry and the residential sector is the leading sector in energy consumption. Transportation and the other sectors consume around 17 % of the total. However, oil is served as 37 %, electricity and natural gas 18 %, coal 17 %, biomass and waste 7 % and the other sources 3 %. The share of natural gas has an incredibly demand since 1990. Electricity has grown 10% since 2000. The final consumption of energy in Turkey is expected to be two fold of TFC compared to 2008.

## 3   Solar Energy Potential and Installed PV Capacity of Turkey Along With the Recent Energy Policy

Turkey is considered as a non-industrialized country among the EU countries for that reason energy demand of the country much more than the others. The consumption of electricity has been increased two fold between 2001 and 2012 as compared with 1999-2001. In 2012 total energy demand became 241.9 TWh (Trends 2013 In Photovoltaic Applications, 2013). In another word, each decade the demand of the electricity increases 2 times compared to previous decade. By 2030, the estimated demand of the electric energy will be 600 TWh. Turkey has a great potential of indigenous and renewable energy sources such as solar energy with fantastic solar radiation that goes up to 2000 kWh/m$^2$-Year as well as 7.2 hours average daily sunshine duration. Turkey is a powerful candidate for exploiting photovoltaic technology with 4800 km$^2$ feasible area and average 2738 hours capacity sunny days in a year. According to the recent report published by Ministry of Energy and Natural Resources, the country's feasible photovoltaic power is 450-500 GW which approximately fulfills the demands of Turkey's 2030 need itself (Mersin Chamber of Mechanical Engineering Presentation, 2013).

However, a total capacity of 600 MW solar power plants is going to be licensed by the end of 2013 that corresponds to 1/10 of the annual electric energy capacity of Turkey. The MW-scaled plants will be applied by 2015. In the first application to Energy Market Regulatory Authority (EPDK), the capacity is exceed 15 times to proposed capacity with 8.9 GW and 496 applicants. The Energy and Natural Resources Ministry is expected to determine the new capacity as soon as a total capacity of 600 MW is scheduled as planned. The ministry intends to increase the share of renewable energy sources up to 30 % by 2023. However, in practice Turkey imports 71.5-72.4 % of energy sources from abroad which makes itself energy-dependent country ranking seventh biggest coal, eight natural gas and twenty-fifth petroleum importer of the World. With Turkey as of 2011 to 91 % of the oil it consumes (51% from Iran), to 98% of natural gas (55% from Russia) is imported (Kaya and Kılıç, 2012). Solar energy along with wind, geothermal, hydropower, biomass and indigenous lignite resources obtainable from electrical energy and current installed power facilities well by evaluating foreign energy dependence sensible reduction will come up. Turkey does not have remarkable solar electricity generation. The installed PV grid-connection is about 2.5 MW and 6 MW off-grid applications in 2012. The amount of installed capacity in last years is not enough to be part of a competitive energy market. Thus, the government must take serious steps and launch radical regulation in the energy policy to abolish discrepancy between energy need and production. This is a must in order to keep the energy corridor in secure. The most positive application made by Turkish government is not to require production license under 1 MW production capacity. Additionally, The Renewable Energy Law 6094 has introduced to explain the purchase guarantee of 13.3 USD cent/kWh (9 Euro cent/kWh) for solar electric energy production for ten years while this period is 20 years in EU countries (Grand National Assembly of Turkey, 2010). In case of the use of local components for the PV system, additional incentives can be granted as following; PV module installation and mechanical construction, (0.8 USD cent /kWh), PV modules (1.3 USD cent/kWh), PV cells (3.5 USD cent/kWh), Inverter (0.6 USD cent /kWh), the focusing material on PV modules (0.5 USD cent/kWh) (Trends 2013 In Photovoltaic Applications). Table 3 shows the installed PV capacity of some countries including Turkey. As it can be seen in Table 3 Turkey has the lowest installed PV capacity among the other countries. However, it is worth noting that although the installed PV capacity of Turkey is only limited 8.5 MW in 2012, minimum price of renewable electricity tariff determined by Turkish Electricity Transmission (TEIAS) varies between 5 and 5.5 Euro cent/kWh while it ranges from 6.2-8.5 Euro cent/kWh in Germany with 32461.6 MW installed capacity in the same year. Intense discussion has been made by many years regarding production and usage of renewable energy resources in Turkey, there has not been much progress due to lack of incentives and legal arrangement by authorities. Figure 3 shows the annual Global Radiation Values (kWh/m$^2$-day) and sunshine duration in an hour unit. Most part of Turkey have a great potential of solar radiation values along with sunshine duration time which goes up to 11.31 hour a day in July and 1800 hours/year in total (Turkish State Meteorological Service Report 2013). However, the global radiation is below 900 hours/year in Germany. There is an enormous discrepancy between the installed solar power capacity and solar radiation values in a year. The discrepancy is not only limited by solar radiation values but also the investments have been made by governments. Germany has been invested 17520 ('000) million USD in 2012. However, the investment on solar power generation is made by Turkey is only 4 million USD in 2012 (Trends 2013 In Photovoltaic Applications, 2013).

## 4 Conclusion

In this study, the timeline of Turkey's energy status is given by tabulating present and future estimated energy balances and key statistical data in Turkey for last three decades to show Turkey's energy dependence to abroad as well as increased energy demand as a result of its growing economy. The negative effect of usage of fossil energy sources are briefly discussed. Following by this, the importance of usage of renewable energy especially solar power generation has been determined in Turkey. The production, consumption, global radiation values, sunshine duration and installed PV capacity of Turkey are tabulated by comparing with the other countries. The recent regulation regarding subsidies are also given. It can be concluded that the current amount of investment and incentives in Turkey are not sufficient to provide energy need for now and the future. To encourage the

photovoltaic installation, the legacy barriers should be removed and investors have to be encouraged to set up grid-connection which will help reduce economic dependence. Last but not least, the world faces a long way to go before it reaches a low-carbon energy system. Private sectors, investors academicians can suggest possible routes to get there, but governments are driving forces to provide energy security thus world's economic and environmental stability and protect ability. It is worth nothing that by 2030 easily accessible supplies of oil and gas probably will no longer keep up with the demand, so there is no other choice than using all renewable energy sources.

# Tarihi ve Kültürel Perspektifte Türkiye-Makedonya İlişkileri

# Turkey-Macedonia Relations from Cultural and Historical Perspective

Ph.D. Candidate Tevfik Orçun Özgün (Hacettepe University, Turkey)

Ph.D. Candidate Onur Koçak (Başkent University, Turkey)

## Abstract

Balkans can be defined as a region which had been under different cultures' and civilizations' reign, and experienced different nations, religions and cultures. It is likely possible to see the effects of these multicultural and multinational structure on international politics and economy. In that sense, Macedonia is inevitably placed in an important point for Balkan and Ottoman history, and even for international politics. It is very possible to see Turkish influence on Macedonia, which -ruled by Ottoman for 542 years- has gained its independence, as a result of disintegration of Yugoslavia in 1991.When we take a look at condensing political and economic relations between Macedonia and Turkey, the effect of shared cultural and historical heritage on regional and wide economic development and cooperation can be seen with no huge effort. From that point of view, Ottoman Empire's historical, sociological and cultural effect on sustainable and improvable economic relations are a topic of discussion. If we focus on the changing balance in Europe, resulted by disintegration of Yugoslavia, and developing approaches towards Macedonia, Turkey's relations with Greece and other regional countries become very important, which are still being operated in terms of development and sustaining. In this study, Turkey's attitude in recognition of Macedonia, and structure of Turkic population in Macedonia will be inspected and from Macedonia perspective, international politics and economic cooperation will be examined with historical, political and cultural emphasis.

## 1 Giriş

Tarihi ve Kültürel Perspektifte Türkiye Makedonya İlişkilerinin bir bildiri konusu olarak ele alınmasının zorluğu yüzyıllara dayanan bir geçmiş göz önüne alındığında açık bir şekilde karşımıza çıkmıştır. Bu bildiride ele alınan konuların genişliği ve detayları ayrı birer çalışma olarak kabul edilebilir. Bunun farkında olarak yalızca önemli görülen birçok noktayı nazardan yola çıkılarak ve belli başlı tarihi olaylar, hadiseler, güncel konular üzerinde durulmaya çalışılmıştır. Bunlar arasında dahi fazla ayrıntıya girmekten sarf-ı nazar edilmiştir.

## 2 Eski Makedonya Tarihi

Bugünkü Makedonya Cumhuriyeti'nin eski tarihiyle ilgili ayrıntılı bilgilere Joseph Roisman, Ian Worthington'nun A Companion to Ancient Macedonia (2010), Susan Wise Bauer'ın The History of the Ancient World: From the Earliest Accounts to the Fall of Rome (2007) ve John Willkes'ın The Illyrians (1996) adlı eserlerinden ulaşmak mümkündür. Milattan Önce 356 yılına kadar dayandırılan tarihlerde II. Filip, sınırları halefi III. Aleksandros (Büyük İskender) tarafından Makedonya'dan Mısır, Suriye'nin bir kısmı ve Hindistan'a kadar genişletilecek olan krallığın temellerini atmıştır. Tarihteki en büyük imparatorluklardan biri olan Makedonya yine başka bir yayılmacı güç Roma tarafından ilhak edilmiş ve M.Ö. 146 yılında Makedonya için Roma Dönemi başlamıştır. Daha sonra Makedonya eyaleti adı verilen bu yeni idare altında, Bulgar Krallığı'nın hâkimiyeti ve etkisi altında bulunmuştur. Doğu Roma İmparatorluğu'nun giderek zayıflaması ile Balkan toprakları tedricen Osmanlı hâkimiyeti altına girmeye başlamıştır.

## 3 Osmanlı Hâkimiyetinde Makedonya

Sırp Krallığı'nın 14. yüzyılda Osmanlı akınlarıyla yıkılması ve 1430'da Sultan II. Murad tarafından Selanik'in alınması, 1444'de Varna ve 1448'de Kosova zaferlerinden sonra Makedonya bir Osmanlı toprağı haline geldi. Osmanlı İmparatorluğu'nun Balkanlara ilerleme yolundaki hareketleri neticesinde bundan sonraki yüzyıllar, Balkan milletleri ve Makedonya açısından siyasi ve kültürel olarak yeni bir dönem olarak kabul edilmektedir. Osmanlılar Balkanların fethiyle, 14. yüzyılda Makedonya'nın da içinde olan Rumeli Eyaleti'ni kurmuşlardır. Makedonya'yı da bu eyalete bağlı olarak Paşa Sancağı, Köstendil Sancağı, Ohri Sancağı ve daha sonra eklenen Üsküp sancaklarına ayırarak Osmanlı yönetim sistemini uygulamışlardır. 16. yüzyılda yapılan idari ve mülki yeniliklere göre tekrar düzenlenene kadar Makedonya topraklarının en fazla idari birimlerini Paşa Sancağı muhafaza etmiştir. Osmanlı İmparatorluğu için Vilayet-i Selâse olarak adlandırılan Makedonya, Selanik, Manastır ve Kosova vilayetlerinden meydana gelmektedir (Nedzıpı, 2006).

Osmanlı Hâkimiyetinde ortaya çıkan kültür, tüm Balkanları içine alan yerel yaşayış ve inançlarla meydana gelen birlikte yaşama, ortak iklimi ve coğrafyayı paylaşma olarak algılanmaktadır. Bu bağlamda Makedonya üzerinde Osmanlı etki ve tesiri bölgede kurulan vakıflar, medreseler, inşa edilen camiler ve hamamlar, tekke ve

zaviyeler ile sağlanmıştır. İmparatorluğun en uzun yüzyılına kadar devam eden bu durum 19. yüzyılda yerini bazı siyasi değişimlere bırakacaktır. Daha önce yukarıda bahsedildiği gibi Makedonya ismi Osmanlı idare sistemi içerisinde vilayet-i selase denen Selanik, Kosova ve Manastır içerisinde kalmaktaydı. Kosova vilayetinin merkezi Üsküp ve güney bölgeleri eski Makedonya'nın sınırları içerisine dâhil olmaktaydı.

Manastır ise batı sınırındaki Arnavut şehirlerini içermekteydi. Bu bağlamda Makedonya adıyla anılan bölgeleri ve sınırları kısaca açıklamak gerekirse: Ege denizi ve Aliakmon (Bistrica) nehri, kuzeyde Şardağı, Üsküp Karadağı (Skopska Crna Gora), Kozjak ve Osogovo dağları, doğuda Mesta (Nestos) nehri ve batıda Korab, Jablanica, Mokra ve Pindos dağları olarak tanımlanabilir. Siroz (Serres), Drama, Kavala, Petric, Menlik (Melnik), Nevrekop (Goce Delcev), Razlog, Cum'a-i Bâlâ (Blagoevgrad), Ustrumca (Strumica), Doyran, Kukus, Gevgeli, Vodina (Edessa), Karaferya (Veroia), Katerine, Selfice (Serbia), Kozani, Kesriye (Kastoria), Florina, Ohri, Pirlepe (Prilep), Debre (Debar), Köprülü (Veles), İştip (Stip), Koçana, Kratova, Kumanova, Kalkandelen, Gostivar gibi kaza ve sancak merkezleri de önemlidir. 19. yüzyılda yoğun bir Müslüman nüfus bulunurken Bulgarca konuşan Slavlar, Rumlar, Arnavutlar, Sırplar, Yahudiler, Ortodoks ve Katolik Hıristiyanlar, Çingeneler gibi çok farklı milletler, farklı din ve mezheplere ait topluluklar vardı (Hacısalihoğlu, 2003).

Bu bölgelerde yaşayan milletlerin nüfusları hakkında kesin bilgiye sahip olmak oldukça güç bir meseledir, zira 19 ve 20. yüzyıllarda belirtilen nüfus verilerinde propaganda yapıldığı gibi gerçeği yansıtmayan rakamların yayınlandığı görülmektedir. Zira Büyük Güçlerin müdahaleleri ve milliyetçilik hareketleri, zaten karmaşık olan nüfus yoğunluğunu çarpıtarak Osmanlı İmparatorluğu aleyhine kullanmak maksatlı eylemler sergilenmesini beraberinde getirmiştir. Örneğin Bulgarların yaptığı nüfus sayımında Türk olmayan Müslüman gruplar dahil edilirken Arnavutlar ayrı tutulmuştur. Buna karşılık 14 Zilkade 1298/8 Ekim1881 tarihinde yayınlanan Sicil-i Nüfus Nizamnamesi'nin birinci fasıl mevadd-ı umumiyesinde Osmanlı İmparatorluğu'nda yaşayan her milletten ahalinin kendini sicil-i nüfusa kaydettirmesini belirtirken kişinin tüm kimlik bilgilerinin de beyan edilmesini ve bunların Müslüman ve Gayr-i Müslim olarak ayrı ayrı kayıt altına alınması bildirilmiştir (Ademi, 2006). Nüfus tetkik sorunlarının karmaşık hale gelmesinin nedenleri bu dönemde artan milli kiliseler, milliyetçi duyguların tetiklediği ulusal bağımsızlık mücadeleleri için kendini hazır hisseden nesiller, artan silah üretimi olarak sıralanabilir. Balkan milletlerinin bu denli kendi milli şuurlarını oluşturmaları Osmanlı Hâkimiyetinde yaşayan diğer milletleri de etkileyecek ve bu giderek savaşa dönecektir.

### 3.1 Makedonya Meselesi

Türk Tarih yazıcılığında, Makedonya ve Balkanların eski tarihine dair fazla çalışma yer almazken 19. yüzyılda elde tutması bir sorun haline gelen Balkanlar ve "Makedonya Sorunu" adıyla kendine yer bulan olaylar hakkında yapılan çalışmalara sıkça rastlanmaktadır. Osmanlı tarihi çalışmalarında mühim bir öneme sahip olan Makedonya Sorunu Osmanlı İmparatorluğu'nun bir iç meselesi olduğu kadar uluslararası siyasette Büyük Güçlerle olan mücadelesidir. Bu sebeple Makedonya Sorunu ve bu meselenin ardındaki olaylar Osmanlı tarihçileri ve Yakınçağ ile ilgilenenler kadar II. Abdülhamit dönemi Balkan politikaları, Jön Türklerin örgütsel gelişimi, siyasi etkileri, Makedonya üzerindeki Bulgar, Sırp, Yunan etkileri ve buna karşı geliştirilen siyasetle ilgilenenler açısından da önem arz etmektedir.

Fransız İhtilali'nin getirdiği milliyetçi hareketler Balkanlarda ulus-devlet modelinin ortaya çıkması bu kadar fazla etnik kültürü bir arada barındıran Balkanlarda çatışmayı beraberinde getirmiştir. Dolayısıyla bu mesele de Bulgaristan'ının, kendi sınırlarını tanıyan Büyük Güçlerin iradesine dayanarak Balkanlarda işgal ve genişleme hareketlerine girişmesiyle başlamıştır.

Osmanlı ve Rus Harplerinin Osmanlı aleyhine neticelenmesi ve Rusya'nın bir diğer geleneksel imparatorluk İngiltere'nin dış politikası gereği Osmanlı İmparatorluğu toprak bütünlüğünü koruma politikası Kırım Savaşında kendini göstermiş İngiltere ve Fransa Osmanlı'nın Rus işgaliyle karşı karşıya kalmasına imkân vermemiştir. Doğu Sorunu adı altında Yunan ve Sırp İsyanlarında aynı tepkiyi göstermeyen Büyük Güçler Bulgaristan Prensliği'nin kurulmasında da Osmanlı yanında yer almamışlardır.

93 Harbi olarak da bilinen 1877-1878 Osmanlı Rus Harbinden sonra St Stephanos (Ayestefanos) Anlaşmasıyla kurulan Büyük Bulgaristan Berlin Anlaşmasıyla üçe bölünmüştür. Gül Tokay'a göre Makedonya Sorunu'nun nedenlerinden biri St Stephanos Anlaşmasıyla Bulgar Prensliği'ne katılan Makedonya topraklarının Berlin Anlaşmasıyla Osmanlı topraklarına tekrar dâhil edilerek bölgedeki Hıristiyanlar lehine Reformlar yapma kararlarının alınması olabilir (Tokay, 1996). Bulgaristan Prensliği, 1885'te Doğu Rumeli Vilayeti'ni işgal ettikten sonra Makedonya üzerindeki amaçlarını kültürel ve aidiyet mevhumlarını çeteler marifetiyle kullanarak göstermişlerdir. Buna karşı Sırp ve Yunan Hükümetleri de aynı temalarla ve yöntemlerle Makedonya üzerinde mücadelelerine hız vermişlerdir. Yukarıda bahsedildiği üzere Makedonya'da daha fazla nüfusa kendilerinin sahip olduğunu iddia eden bu devletler Balkan Yarımadasının kavşağı konumunda olan bu stratejik bölgeyi ilhak etmek istemişlerdir.

1893 yılında Bulgaristan Sofya'da bulunan İç Makedon İhtilâl Örgütü, yukarıda bahsedilen çetelerden biridir. 1895 yılında Yüksek Makedonya Komitesi gerçekleştirdiği Melnik İsyanıyla adını duyurmuştur. Bulgaristan destekli bu örgütler, özellikle İç Makedon İhtilal Örgütü etkili silahlı faaliyetlere başladı, 1902 yılında Cum'a-i Bâlâ'da gerçekleştirdiği isyan, Almanya ve Avusturya'nın özerk Makedonya oluşumunu desteklememesi ve

Osmanlı'nın bu isyanı bastırması, Rusya ve Avusturya hükümetlerinin Osmanlıya eyaletin idaresi hakkında reform uygulamasını talep etmesiyle son bulmuştur. Ancak Büyük Güçlerin müdahalesi devam etti ve İngiliz Dışişleri Bakanı Lord Landsowne'un eyalete Hristiyan bir valinin atanması, Hristiyan subayların bulunması, Osmanlı kuvvetlerinin ger çekilmesini önermesiyle durum yeniden ele alınmak durumunda kaldı (Anderson, 2010). Mürzsteg Konferansı meydana geldi ve Makedonya reform sistemi hazırlandı, Büyük Güçlerin Makedonya'nın Bağımsızlığını tam olarak desteklememekle beraber Rusya ve Avusturya'nın Fransa ile İngiltere'nin birbirlerini denetleyerek ya da kontrol altında tutarak hareket ettikleri söylenebilir.

Makedonya, 20. yüzyıla hükümdarlığının son yıllarına yaklaşan II. Abdülhamit tarafından eyaletin iktisadi durumunu denetlemek üzere bir komisyon kurulmasına izin vermesiyle girdi. 1908 yılında İsvolski-Harding projesi olarak adlandırılan ve Makedonya valisinin Osmanlı tebaası olması ancak Büyük Güçlerin onayı ile atanması ve idarede Avrupalı memurların bulunması olarak tanımlanan yeni durum kabul edildi. Bu sırada II. Abdülhamit'in tahttan indirilmesi ve Jön Türklerin idareyi ele almasıyla uluslararası mali komisyon kapandı, Avusturya ve Rusya'nın danışmanları geri çektirildi, bunun yanında genel seçimler yapıldı ve Türk, Arnavut, Rum, Bulgar-Makedon, Sırp, Ulah ve Yahudi mebuslar Osmanlı Meclis-i Meb'ûsanı'na girdi. Ancak milliyetçiliği bırakmayan gruplar ile merkezî anlayıştan vazgeçmeyen İttihat ve Terakki arasındaki uçurumun açılması bu girişimin başarısız olmasındaki en büyük etkenlerden biridir (Anderson, 2010, Adanır, 1996).

1912 yılında Rusya'nın desteklediği Bulgaristan ve diğer Balkan Devletleri, Osmanlı İmparatorluğu'na savaş ilan etti. 1913'te savaş sona erdiğinde Makedonya tamamıyla elden çıktı. Makedonya'nın taksimatı konusunda anlaşmazlığa düşen devletler II. Balkan Savaşını da hazırladı. 1913 Bükreş Anlaşmasıyla Makedonya'nın büyük kısmı Yunanistan ve Sırbistan devletlerine dâhil oldu. Bulgaristan'ın, ancak Pirin Makedonya'sına sahip olması I. Dünya Savaşında, Sırbistan'ın elinde bulunan Vardar bölgesini işgal etmesine yol açtı ancak I Dünya Savaşı Yunanistan ve Sırbistan ve İtilaf devletlerinin lehine sonuçlandı ve Makedonya için Bükreş Antlaşması kabul edildi.

### 3.2 Makedonya'da Osmanlı Mirası

Makedonya'da Osmanlı etkileri 14 ve 15. yüzyıllarda Osmanlı Hâkimiyetinin artmasıyla İslami mimariye uygun olarak gelişmiştir. Bu devirde İslam'ın ve yerel halkın kaynaşması tekke ve zaviyeler aracılığıyla gerçekleşmiştir. Bunlar arasında İshak Bey, İshak Çelebi, Kaçanikli Mehmet Zaviyeleri, İsa Bey Hanikahı, İplikçi Hasan Efendi, Emir Hoca, Veliyuddin Vardar Tekkeleri ve Hacı Ayşe Hatun Zaviyesi sayılabilir. Bunlar haricinde toplumun sosyal hayata bağlanması ve şehirleşme açısından oldukça mühim olan vakıflar, kendilerine bağlı olarak cami, medrese, han, hamam, külliye gibi hayır kuruluşları yapmışlardır. Makedonya'da eğitim diğer Osmanlı kentlerinde olduğu gibi medreseler aracılığıyla sağlandı. Makedonya için ise Sahn-ı Semân önemli bir örnek olarak karşımıza çıkmaktadır. Medreselerin yanında Sıbyan Mekteplerinin de açılması ve yaygınlaşması artan nüfusun eğitim ihtiyacını karşılamaya yöneliktir. Üsküp'te Koca Mustafa Paşa, Ohri'de Ohri Zade Mektebi ve Ağa Mektebi bunlara örnek olarak verilebilir (Nedzıpı, 2006).

Tüm bunların yanında İshak Bey ve İshak Çelebi Kütüphanelerini de belirtmek gerekmektedir. Makedonya'daki en yaygın Osmanlı yapılarından, camilerden başlıcaları Sultan Bayezid Camii, II. Sultan Murad Camii, İshak Bey Camii sayılabilir. Tüm bunlar gibi Hanlar ve Hamamlar da hem Müslüman Türk toplumunu oluşturan hem de Osmanlı kent mimarisinin önemli yapılarındandır. Bunlar için de Sulu Han, Sinan Bey, Karakadı ve Çömlekçi-Zade örnek olarak verilebilir (Nedzıpı, 2006). Su kemerleri, çeşmeler ve köprüler de bölgenin İmparatorluk için önemi ve yapılan yatırımlar hakkında bilgi vermektedir. Osmanlı mirasının bu denli hala günümüzde görülebildiği Makedonya'nın II. Dünya Savaşından sonra girdiği Yugoslavya idaresinden sonra karşılaştığı sıkıntılar ve Türkiye ilişkilerine değinmenin uygun olduğunu düşünüyorum.

## 4 Türkiye –Makedonya İlişkileri

### 4.1 Makedonya'nın Bağımsızlığı

I. Dünya Savaşı sonrasında Yunanistan, Sırp, Hırvat, Sloven Krallıkları ve Bulgaristan arasında paylaşılan Makedonya II. Dünya Savaşı sonrasında Yugoslavya Federasyonu'nu oluşturan devletlerden biri haline gelmiştir. 1974 ve 1989 yıllarında Makedonya Anayasasında yapılan değişikliklerle Kosova özerk bir bölge olarak kabul edilirken Arnavutlar, Makedonlar ve Türklerden oluştuğu belirtilmişti ancak daha sonra Makedonya, "Makedonya ulusunun" devleti olarak tanımlanmıştır. Yugoslavya'da başlayan iç savaş ve Yugoslavya'nın bölünmesi Makedonya'nın da 17 Kasım 1991 tarihinde bağımsızlığını kazanmasına yol açmıştır. Makedonya 6 Şubat 1992 tarihinde Türkiye tarafından tanınmıştır.

Makedonya yaşadığı büyük sıkıntılar, çatışmalardan sonra Yugoslavya'dan ayrıldıktan sonra ekonomik olarak da zorluklar çekmeye devam etmiştir. Küçük ölçekli bir ekonomiye sahip olan Makedonya üretim teknolojisi modern olmayan düzeyde, girişimci gücü zayıf, sermayesi ise yetersiz konumdadır. Şarap üretimi ve küçükbaş hayvancılık iyi olmakla beraber tekstil işletmeleri de nispeten hareketlilik göstermektedir (Babalı, 2012).

### 4.2 Yeni "Makedonya Meselesi"

Türkiye, Makedonya'yı anayasal adıyla "Makedonya Cumhuriyeti" olarak tanıyan ilk ülkelerden biri olmuştur. Yunanistan ile mevcut sorunlarına rağmen Makedonya'nın Avrupa-Atlantik yapılarına üyeliği ve ülke bütünlüğünü koruması Türkiye açısından önem arz etmektedir. Makedonya'nın NATO üyesi olması, ülke için istikrarı da beraberinde getireceği için Türkiye Birleşmiş Milletler aracılığıyla bir problem olarak devam eden isim meselesine kalıcı bir çözüm getirme çabası içerisinde olmuştur.

2008 yılında NATO Bükreş Zirvesinde Yunanistan'ın engellemesi ile üyeliğe davet edilmiştir. Sebep olarak ise Yunanistan ile devam eden isim sorunu ortaya atılmıştır. 2010 yılında Lizbon NATO Zirvesinde 2008 yılında alınan karar tekrar edilmiş, NATO üyeliğinin Yunanistan ile olan sorunun çözülmesiyle gerçekleşebileceği belirtilmiştir.

Avrupa Birliği süreci ise 2005 yılında Makedonya'ya tanınan aday ülke statüsü ile başlamıştır, AB ülkeleri tarafından gerekli görülen reformların yapılmasının yanı sıra isim sorununun çözümü için hamleler gerçekleştirilmesini beklemektedir. 2011 yılındaki AB İlerleme Raporunda siyasi kriterlerin yerine getirilmeye devam edildiği, iyi komşuluk ilişkilerinin geliştirilmesinin gerektiği belirtilmiştir. Bunun yanında belirtilmelidir ki 1995 yılında geçici olarak da olsa Makedonya, "Eski Yugoslavya Cumhuriyeti Makedonya" adı ile uluslararası örgütlere üye olmasını mümkün kılan bir anlaşmayı kabul etmiştir. Yunanistan geçerli ve coğrafi bir tanımlama arz eden bir isim üzerinde durmakta iken Makedonya ise ikili ilişkilerde ulusal ismin, uluslararası olarak da Yunanistan ile anlaşmaya varılacak bir ismin kullanılmasını desteklemekte ve en önemlisi Yunanistan'ın aksine Makedon dili ve ulusal kimliğinin müzakere edilemeyeceğini savunmaktadır.

Bulgaristan da bazı sorunlarla komşuluk ilişkilerinin gelişimini engellemektedir. Makedon etnik kimliğini ve Makedoncayı tanımayarak Yunanistan ile aynı siyasi hamleleri uygulamaktadır. Bulgaristan'daki Makedon azınlık da sorunlardan bir tanesidir. Sırbistan ile ekonomik ve siyasi ilişkilerin iyi şekilde devam ettiğini söylemek mümkündür. Arnavutluk ile olan ilişkiler ise geçmişe nazaran iyileşmeye yönelik bağlarla sürdürülmektedir (Babalı, 2012).

### 4.3 İlişkilerin Siyasal, Ekonomik ve Kültürel Boyutu

Yukarıda bahsedildiği üzere Türkiye bağımsızlığını kazandığından beri Makedonya Cumhuriyeti'nin ulusal bütünlüğünü, sınırlarını kabul etmiş, çok kültürlü mozaik yapısının muhafazasını desteklemiştir. Üsküp'e Büyükelçi gönderen ilk devlet olan Türkiye aynı zamanda anayasal adıyla "ulus" olarak tanıyan ilk devlettir. Daha önce bahsedilen 2008 yılındaki Bükreş NATO Zirvesinde Arnavutluk ve Hırvatistan ile beraber Makedonya'nın NATO üyeliğini desteklemiştir. 2008 tarihinde Makedonya ve Türkiye arasında imzalanan İkili İlişkilerin Güçlendirilmesine Yönelik Strateji Belgesi" ile ileriye yönelik ilişkilerin güçlendirilerek geliştirilmesi yönünde karar alınmıştır. Bunu 2010 yılında "Türkiye Cumhuriyeti Milli Savunma Bakanlığı ile Makedonya Cumhuriyeti Savunma Bakanlığı Arasındaki Nakdi Yardım Protokolü"nün imzalanması takip etmiştir. Makedonya'ya doğrudan yatırım yapan birçok Türk firması ekonomik ilişkileri sıcak tutarken ticaret hacmini de sürekli arttırmaktadır. Türk sermayeli Ziraat ve Halkbankası, THY'nin Üsküp'e İstanbul ve İzmir'den yaptığı seferleri arttırması da ikili ilişkilerin önemini ortaya koymaktadır.

2005 yılında TİKA'nın Üsküp'te şube açmasıyla bölgede Türk toplumuna yönelik yatırımlar yapılması mümkün hale gelmiştir. Makedonya'da bulunan Türk-İslam eserlerini korumaya yönelik eylemleri de olmuştur. Türk Tarih Kurumu, Devlet Planlama Teşkilatı ile birlikte Makedonya'daki Türk eserlerinin envanterini çıkarma çalışmasını yürütmüştür. Rumeli Türkleri Kültür ve Dayanışma Derneği'nin bölgedeki faaliyetleri de kültürel ilişkilerin geliştirilmesi adına önemli adımlardır (Babalı, 2012).

## 5  Sonuç

Tarihi ve sosyo-kültürel bağlarla Türkiye'nin Balkanlarda en önemli müttefiki olmaya aday olan Makedonya, Türkiye ile Balkanların güvenliği, ekonomik gelişme ve refah için gerekli olan istikrar ortamını oluşturma ve gerçekleştirme maksatlarını taşıdığını tarafımızca taşımaktadır. Makedonya ile ikili ilişkilerin geliştirilerek çok yönlü bir şekilde diğer Balkan devletlerinin de dahil edilmesi bölge için önem arz etmektedir.

Makedonya ve Türkiye'deki üniversiteleri arasında gerçekleştirilecek işbirliği, akademik düzeyde karşılıklı alışveriş ya da verilecek destekler bu aşamada ön plana çıkarılabilir. Makedonya'daki üniversitelerin bünyesinde Türkoloji Enstitülerinin yaygınlaştırılması ve desteklenmesi, Türk tarihi, dili ve sosyolojik yapısının gelişim süreçlerinin araştırılması ve bölgede etnik yapıların oluşumu ve birbirleriyle etkileşimi ve sorunlar üzerine çalışmalar yapılmasının oldukça gerekli olduğunu düşünmekteyiz.

Batıya açık, dünya ile temaslarını her düzeyde ve seviyede geliştirmeye müsait bir Balkan ülkesi olduğuna inandığımız Makedonya'nın bölgesel iktisadi temaslarını geliştirerek ekonomi hacmini arttırmasının çevre ülkeleriyle olan etnik ve tarihe dayalı sorunlarının net olarak tanımlanması ve çözümü ile mümkün olduğu saptamalarımızdan biridir. Ancak bu, bağımsızlığını kazanmasının üzerinden 13 yıl geçen Makedonya'ya komşu ülkelerin de ulusal kimlik, dil ve kültür yapısına saygı göstermesiyle mümkündür. Bu aşamada vazgeçilemez ve

müzakereye dahi konu edilemez milli değerlerin uluslararası platformlarda sahip çıkılması ve korunması gerekmektedir.

# Türkiye ve Avrupa Birliğine Aday Geçiş Ekonomilerinde Uluslararası Göç Trendleri

# International Migration Trends in Turkey and European Union Candidate Transition Economies

Prof. Dr. Nuray Gökçek Karaca (Anadolu University, Turkey)
Asst. Prof. Dr. Semra Saruç (Anadolu University, Turkey)

## Abstract

In this study, international migration trends were evaluated in Turkey and European Union (EU) Candidate Transition Economies by means of data obtained from HDI Report developed by UNDP. The aim of this study is analyzing international migration trends in relation with other dimension of integration such as economics, social protection and social policy. In this study, the subject was carried out through comparative relation scanning model and literature model, the sample group was established EU candidate transition economies (Montenegro, The Former Yugoslav Republic of Macedonia, Serbia, Albania, Bosnia and Herzegovina) with Turkey. The research data was collected by means of data from HDI Report developed by UNDP. The findings from this study revealed that the population of Montenegro and Serbia among EU candidate transition economies less emigrated and more immigrated than other countries. It can also be concluded that the emigration trend of Turkey presents similar tendency with Montenegro and Serbia whereas immigration rate of Turkey is lower than the other countries except for Bosnia Herzegovina.

## 1 Giriş

Siyasal, ekonomik, sosyal ve kültürel öğelerin karşılıklı etkileşimlerini içeren çok boyutlu bir olgu olarak ifade edilen göç olgusu, günümüzde bilgi ve sermaye akışı gibi küreselleşme deyince ilk akla gelen kavramlardan biri olmuştur. Zira bugün dünya nüfusunun önemli bir kısmını göçmenler oluşturmaktadır. Nitekim tüm dünyada 214 milyon uluslararası göçmen olduğu tahmin edilmektedir. Bu rakamlar her 33 kişiden birinin göçmen oluğunu ve dünyada göçmenlerden oluşan bir ülke olsaydı, dünyanın en çok nüfusa sahip 5. ülkesinin göçmenler ülkesi olacağını ortaya koymaktadır. Dünyadaki mülteciler ve yasa dışı göçmenler de dahil 214 milyon olan göçmen sayısının teknolojik değişim, ekonomik entegrasyon, şehirleşme oranlarındaki artışlar ve küreselleşmenin ekonomik ve sosyal sonuçlarına bağlı olarak artacağı tahmin edilmektedir.

2013 UNDP İnsani Gelişme Raporuna göre daha önce gelişmekte olan ülkelerden gelişmiş ülkelere doğru yönelen uluslararası göçün yerini, gelişmiş olan ülkelerden başka bir deyişle güney ülkelerinden güney ülkelerine yönelen göç almıştır. Hatta yakın dönemde gelişmekte olan ülkeler arasındaki göç, gelişmekte olan ülkelerden gelişmiş ülkelere (güneyden-kuzeye) yönelen net göçü aşmıştır.

Son dönemde uluslararası göçün göçmen işgücünün havaleleri, yatırımları ve beyin göçünün geri dönüşüne bağlı olarak göç veren ülkelerin kalkınmasında olumlu etkiler yaratacağı konusunda UNDP'nin de içinde yer aldığı uluslararası kuruluşların gündeminde artan bir uzlaşının bulunduğu görülmektedir (Gökbayrak, 2008). Ancak bu olumlu etkilerin hem göç biçimlerine, hem de ülkelerin ekonomik, siyasal ve sosyal ortamlarındaki farklılıklara bağlı olarak değiştiğinin göz ardı edilmemesi gerekir. Zira Türkiye'de dâhil olmak üzere birçok göç veren ülkenin beyin göçünden olumlu bir dışsallık sağlama potansiyeli bulunmakla birlikte, bu potansiyel tek başına anlam taşımamakta, bilinçli kamu politikaları kapsamında gerekli ortamın sağlanması durumunda potansiyel olumlu etkilerin ortaya çıktığı görülmektedir (Gökbayrak, 2008).

2013 İnsani Gelişme Raporuna göre göç konusu, ticaret ve iklim değişikliği gibi uluslararası toplumun çözüm bulması gereken, çok taraflı işbirliği modelleri ile değerlendirilmesi gereken küresel bir konudur.

Bu çalışmada, uluslararası toplumun çözüm bulması gereken küresel konulardan biri olarak uluslararası göçün Avrupa Birliğine aday geçiş ekonomilerinde ve Türkiye'de trendleri bağlamında ülke kalkınmasına katkısı bakımından karşılaştırmalı bir değerlendirme yapılacaktır.

## 2 Göç ve Uluslararası Göç Kavramı

Literatürde tam bir kavram birliğinden söz edebilmek mümkün değilse de, insanlık tarihi kadar eskiye dayanan bir insanlık fenomeni olan göçü, insanların daha iyi hayat şartlarına kavuşmak üzere geçici bir süre için veya kalıcı olarak bir yerden bir yere gitmesi şeklinde tanımlamak mümkündür. Göçün tanımlanmasında olduğu gibi, literatürde göçün sebepleri konusunda da tam bir görüş birliğinden söz etmek mümkün değildir. Ancak günümüzde savaşların, doğal afetlerin, nüfus artışının, dinsel, kültürel, ekonomik (küresel ticaretin), siyasi (insan hakları ve demokratikleşme), jeopolitik (sınır bölgelerinde sığınmacı olma zorunluluğu) ve ailevi faktörlerin

göçe neden olduğu genel kabul görmektedir (Werner, 1996; Gençler, 2002). Söz konusu nedenlere bağlı olarak göç olgusu, ulusal sınırlar içerisinde gerçekleşebileceği gibi uluslararası nitelik de kazanabilir.

Genel olarak uluslararası göç altı kategoride incelenmektedir (De Tapia, 2003. Akt. Aksoy, 2012). Bunlar şu şekilde sıralanabilir:

- Sürekli yerleşenler
- Süreli sözleşmeli işçiler
- Süreli profesyonel çalışanlar
- Gizli veya yasa dışı çalışanlar
- Sığınmacılar
- Mülteciler

Birleşmiş Milletlere göre göçün uluslararası göç kategorisinde değerlendirilebilmesi için, ülkesinden ayrılan kişinin başka bir ülkede en az bir yıl süre ile yaşaması gerekmektedir (Gençler, 2004). Bu ölçüt bağlamında Birleşmiş Milletler tarafından saptanan uluslararası göç verilerine göre 2010 yılında dünya nüfusunun %3,1'i göçmendir. Göreli olarak dünyanın gelişmiş bölgelerindeki göçmen sayılarının toplam nüfusa oranı 10,3; daha az gelişmiş bölgelerindeki göçmen sayısının toplam nüfusa oranı ise 1,5'tir. Dünyadaki toplam göçmenlerin % 32, 6'sı Avrupa'da, %23,4'ü de Kuzey Amerika'dadır. Kuzey Amerika'daki göçmenlerin %20'si ise ABD'de yaşamaktadır. Dünya Bankası'nın 2011 verilerine göre ise, Dünyadaki göçmen stoğu 215 milyon 763 bin 515'tir. Bunun 107.878.427'sini OECD tanımlamasındaki yüksek gelirli ülkelerdeki göçmenler oluşturmaktadır. Yine uluslararası göç istatistikleri incelendiğinde, göçün yönünün değiştiği de görülmektedir. Nitekim UNDP İnsani Gelişmişlik Raporunda da ifade edildiği üzere, daha önce az gelişmiş ülkelerden gelişmiş ülkelere doğru yönelmiş olan uluslararası göçün yönü, şimdilerde gelişmekte olan ülkelerden gelişmekte olan ülkelere doğru yönelmiştir.

## 3   Türkiye'de Uluslararası Göç Trendleri

Türkiye'de uluslararası göç verilerinin derlenmesine ilişkin düzenli bir kayıt sistemi bulunmamaktadır. Uluslararası göç istatistikleri konusunda veri kaynakları; nüfus sayımları, sınır istatistikleri, idari kayıtlar ve araştırmalardır. İdari kayıt olarak oturma izinleri, sığınmacı ve mülteci kayıtları ile pasaport ve yasa dışı göç bilgileri Emniyet Genel Müdürlüğü tarafından; çalışma izinleri ve yurt dışında yaşayan Türk vatandaşlarına ait bilgiler Çalışma ve Sosyal Güvenlik Bakanlığı tarafından; vatandaşlık bilgileri Nüfus ve Vatandaşlık İşleri Genel Müdürlüğü tarafından derlenmektedir. TÜİK Başkanlığı tarafından yapılan nüfus sayımlarıyla ise yurt dışından Türkiye'ye göç eden nüfusun büyüklüğü ve niteliği ile ilgili bilgiler derlenmektedir. Değinilen kurumların idari çalışmaları doğrultusundaki derledikleri bu veriler, göç istatistiklerinin karşılaştırılabilirliği ve ölçülebilirliği açısından uluslararası tanımlamalara ve sınıflamalara uygun değildir.

Türkiye'de uluslararası göç istatistiklerinin kapsamını; "yurt dışından gelenler, yurt dışına gidenler, oturma ve çalışma izni alan yabancılar, sığınmacı ve mülteciler, yasa dışı göç edenler, vatandaşlığa girenler, vatandaşlıktan çıkanlar, yabancı nüfus ve yurt dışında yaşayan Türk vatandaşlarına ilişkin bilgiler" oluşturmaktadır.

Çalışma ve Sosyal Güvenlik Bakanlığı verileri yurt dışına gönderilen işgücü göçü akımının 2010 yılı 2011 yılı arasında % 2 artarak 53.800'e yükseldiğini göstermektedir. Türk taşeron işçilerinin ana varış yerleri incelendiğinde ise orta doğu (28300) ve bağımsız devletler topluluğu (18200) ülkelerinin ilk sıralarda yer aldığı görülmektedir (International Migration Outlook, 2013).

2010 yılı verilerine göre Türkiye'de yasal olarak ikamet eden 220.000 yabancı bulunmaktadır. Bu yabancıların % 11'i çalışma iznine bağlı olarak, % 17'si ise eğitim nedeniyle yasal göçmen statüsündedir. 2011 yılı içinde 11.800'den fazla kişiye çalışma izni verilmiş ve 2010 yılıyla karşılaştırıldığında çalışma izinlerinde % 25'lik bir artış olmuştur.

Türkiye'de yabancı sayısındaki artış gibi, uluslararası öğrenci sayısında da artış yaşanmaktadır. 2011-2012 öğretim yılında 8400 yabancı öğrenci Türkiye'deki üniversitelere kayıt yaptırmış olup, bu öğrencilerle birlikte yabancı öğrenci sayısı 31.900'e ulaşmıştır.

Türkiye'de yasal olarak ikamet eden yabancılar dışında, yasa dışı olarak ikamet eden yabancı sayısında da ciddi bir artış olduğu görülmektedir. Nitekim yakalanan yasa dışı göçmenlerin sayısı 2010 yılı ile 2011 yılı arasında % 31'lik bir artışla 42.800'e ulaşmıştır. Türkiye'de yakalanan yasa dışı göçmenlerin 1/3'ünün Türkiye'ye çalışma iznine sahip yasal göçmenlerin misafiri olarak giriş yaptıkları, 2/3'ünün ise Türkiye'ye yasa dışı ya da kaçak yollardan giriş yaptıkları saptanmıştır.

Türkiye'ye giriş yapan sığınmacıların oranında da son yıllarda ciddi bir artış görülmektedir. Nitekim sığınmacıların sayısı da 2010 yılı ile 2011 yılı arasında % 74'lük bir artışla 16.000'e ulaşmıştır. 2011 yılında sığınmacı olarak başvuranların yarısı Irak'tan, % 21'i ise İran'dandır. Sığınmacıların önemli bir çoğunluğunu ise Avrupa'ya gitmek için Türkiye'yi transit ülke olarak kullananlar oluşturmaktadır (International Migration Outlook, 2013).

Türkiye'de göç hareketini üç başlık altında toplamak mümkündür:

***Transit Ülke Olması Nedeniyle Kaçak Nüfus Hareketi:*** Türkiye, Afganistan, Pakistan, Irak, İran, Bangladeş gibi ülke vatandaşlarının Avrupa ülkelerine geçişi bakımından transit ülkedir. Sahra güneyinden gelen göçmenler için de Kuzey Afrika, Türkiye ve Balkan ülkeleri transit geçiş noktaları olmuştur.

***Ekonomik Nedenlerle Gelen Yabancı Nüfus Hareketi:*** Türkiye'de bugün 2 milyon civarında göçmen işçi bulunduğu, bunun en az yarısının kaçak olduğu tahmin edilmektedir. Ulaşım ve iletişim teknolojisindeki gelişmeler, küreselleşme ve işgücü hareketliliği Türkiye'ye olan göçü etkilemektedir.

***Çeşitli Bölge Ülkelerinden Gelen Zorunlu Göç Grupları Mülteci/Sığınmacı Hareketi:*** Türkiye'ye yönelen sığınmacı hareketinde özellikle son yıllarda yaşanan bölge ülkelerdeki siyasi istikrarsızlık önemli bir etkendir. Nitekim 2011 yılında yaklaşık 18.000 Suriyeli ülkelerindeki siyasi istikrarsızlık nedeniyle Türkiye'ye giriş yapmıştır. 2012 yılı sonunda ise Türkiye'de yerinden edilmiş Suriyeli sayısı 140.000'e ulaşmıştır. Günümüzde Suriye'den gelen sığınmacıların sayısının 400.000'i geçtiği tahmin edilmektedir. Türkiye Suriyeli sığınmacılara konaklama, geçici koruma ve insani yardım sağlamıştır. Türkiye açık sınırlarını korumuş ancak Suriye vatandaşlarını zorla ülkelerine geri dönmeye zorlamaktan kaçınmıştır (İçduygu ve Aksel, 2012).

Değinilen üç göç hareketi bağlamında yurtdışından Türkiye'ye yönelen göçlerin ülkelere göre dağılımı incelendiğinde, 1995-2000 döneminde ülkemize göç eden toplam 130.762 erkek nüfusun; %31,1'i Almanya'dan, % 9,9'u Bulgaristan'dan, % 6,7'si Kuzey Kıbrıs Türk Cumhuriyeti'nden, % 3,5'i Azerbaycan'dan göç edenlerdir. Aynı dönemde ülkemize göç eden 103.349 kadın nüfusunun da; % 32,0'sı Almanya'dan, % 14,0'ı Bulgaristan'dan, % 4,9'u Kuzey Kıbrıs Türk Cumhuriyeti'nden, 4,4'ü de Azerbaycan'dan göç edenlerden oluştuğu görülmektedir. Ülkemize göç eden erkeklerde oran olarak en yüksek değere % 92,1 oranı ile Bangladeş, en düşük değere de %15,1 oranı ile Moldova Cumhuriyeti sahiptir (TOBB, 2012). Söz konusu istatistiklerden de anlaşılabileceği üzere, Türkiye'ye en çok göç veren ülkeler Bulgaristan, Almanya, Yunanistan, Makedonya, Hollanda, Romanya, Rusya, Birleşik Krallık, Azerbaycan, Fransa ve son dönemde Suriye'dir.

Türkiye'de uluslararası boyutta ilk göç hareketi 1950'li ve 60'lı yıllarda Almanya'ya yoğun olmak üzere doğudan batıya doğru gerçekleşmiştir. Temel nedeni ise ekonomik sorunlardan kaynaklıdır. Bugün Türkiye nüfusunun % 6'sının dünyanın farklı ülkelerinde yerleşmiş olduğu görülmektedir (İçduygu, 2009). Dünya Bankası (2011) verilerine göre Türkiye'nin yurtdışındaki toplam göçmen sayısı 4.261 milyon, yurtdışındaki göçmenlerin toplam nüfustaki payı % 5,6'dır. Türkiye'nin en çok göç verdiği ülkeler ise Almanya, Fransa, Hollanda, Avusturya, ABD, Bulgaristan, Belçika, Suudi Arabistan, Birleşik Krallık, İsviçre'dir (World Bank, 2011).

Türkiye'de göçü etkileyen üç temel etken vardır. Bu etkenler "Türkiye'nin ekonomik çekim merkezi olması", "Türkiye'de göçü kolay kabul eden ve kolaylaştıran yasaların varlığı" ve "Türkiye'nin transit geçiş ülkesi olması" şeklinde sıralanabilir.

1960'lardan itibaren yurt dışına göç veren Türkiye ekonomik değişim ve küreselleşme ile birlikte başka ülkelerden göç almaya başlamıştır. Yukarıda da değinildiği üzere, aynı zamanda Türkiye'nin transit bir geçiş ülkesi olması da göç alışını kolaylaştıran önemli bir etkendir. Dünyadaki göç hareketlerinin önümüzdeki yirmi yıl içinde büyük ölçüde artacağı düşünülmektedir. Yine eskiden göç veren ülkelerin gelecekte göç alan ülkeler haline gelebileceği de öngörülmekte ve Türkiye'nin göç alan ülkeler kategorisinde yer alacağı tahmin edilmektedir.

## 4  Geçiş Ekonomilerinde Uluslararası Göç Trendleri

### 4.1  Bosna Hersek'te Uluslararası Göç Trendleri

İnsan Hakları ve Mülteciler Bakanlığı tarafından yapılan tahminlere göre Bosna Hersek 2011 göç profiline göre, Bosna Hersek toplam nüfusunun % 43,4'ü (1.669.000 kişi) yurt dışında yaşamaktadır. OECD verilerine göre ortalama olarak 2000 yılından beri her yıl 15.000 ile 20.000 arası Boşnak AB'ye göç etmektedir. Kupiszewski ve arkadaşlarının (2009) göç alan ülkelerin istatistiklerini kullanarak yaptığı tahminlere göre, Bosna'dan tahmini göç 2001'de 49.000 iken 2007'de 30.000'dir. 2000-2007 dönemi için Bosna'dan yurt dışına yönelen net göç oranı yaklaşık olarak 63.000'dir.

Günümüzde Bosna'dan göç edenlerin geleneksel hedef ülkeleri; ABD (350.000), Hırvatistan (300.000), Almanya (240.000), Sırbistan, Avusturya ve Slovenya (her biri için 150.000)'dır. Özellikle 1990'lardaki savaş sırasında önemli sayıda Boşnak mülteci bu ülkelere giriş yapmış ve bu ülkelerde güçlü diaspora toplulukları kurmuşlardır. Dolayısıyla Bosna'dan göç edenlerin geleneksel hedef ülkelerinin gelecekte de hedef ülke olma özelliğini koruyacakları tahmin edilmektedir.

Bilindiği üzere Bosna Hersek savaş ve savaş sonrası ile karakterize bir ülkedir. Kuşkusuz bu durum Bosna Hersek'in göç yaklaşımı ve politikalarına da yansımaktadır. Nitekim geleneksel olarak göçe eğilimli bir ülke olmakla birlikte Bosna Hersek'te en önemli göç akımları "savaş ve savaş sonrası dönem" olarak ifade edilen son yirmi yılda gerçekleşmiştir.

Son yirmi yılda Bosna Hersek'te birbirinden farklı özellik gösteren göç hareketleri üç dönem açısından ayrı ayrı incelenebilir (Kacapor ve Oruc, 2012):

***Çatışma Kaynaklı Göç Dönemi:*** Çatışma kaynaklı göç, Bosna Hersek'in eski Yugoslavya'dan ayrılarak bağımsızlığını ilan etmesiyle başlayan savaş dönemine rastlayan 1992-1995 yılları arası gerçekleşen göçtür. Bu dönemde ülkenin toplam nüfusunun yaklaşık yarısı yer değiştirmiş ve yaklaşık 105.000 kişi ölmüştür. Toplam nüfusunun % 25'i yerinden edilirken, diğer % 25'i başka ülkelere sığınmıştır. Sonuç olarak nüfusun neredeyse tamamında etnik bölünme yaşanmıştır (Kacapor ve Oruc, 2012). Tabeau ve Bijak (2005), UNCHR verilerini kullanarak yaptığı tahminde, 1992 yılı sonunda Bosna'dan giden mülteci sayısının yaklaşık 1.8 milyon olduğunu belirtmiştir. Yerinden edilenlerin sayısı ise 810.000 olarak tahmin edilmektedir. Mültecilerin en yoğun çıkışı ise 1995 yılında "Srebrenica katliamı"ndan sonra olmuştur. Ibrelyic ve arkadaşları (2006), UNECE raporlarını kullanarak 1996 yılında Bosna'dan giden mültecilerin varış ülkelerini sıralamıştır. Buna göre komşu ülkeler mültecilerin ilk varış yeridir. Fakat çoğu 1992 ve 1996 yılları arasında başta Batı Avrupa ve ABD olmak üzere uzak ülkelere taşınmıştır. Bu insanların ilk önce komşu ülkelere sığınması genellikle "zorunlu göç" desenleri ile uyumludur. Daha sonra komşu ülkelerdeki beklentilerin eksikliği (itici nedenler) ya da ekonomik fırsatların çekiciliği (çekici nedenler) nedeniyle daha uzak hedefleri seçmişlerdir.

***Geri Dönüş Göç Dönemi:*** 1996-2000 yılları arası gerçekleşen geri dönüş göçü savaş sonrasına rastlar. Bu dönem 1995 yılı sonunda savaşın sona ermesiyle birlikte mültecilerin kitlesel halde geri dönüşü ile karakterize edilir. Zira bu dönemde mültecilerin yaklaşık %40'ı geri dönmüştür. Örneğin sadece Almanya'dan 194.000 geri dönüş olmuştur.

***21. Yüzyılın Gönüllü Göç Dönemi:*** Mültecilerin Bosna'ya geri dönmesi ile karakterize edilen ve pozitif net göç dengesi yaratan ikinci dönemin ardından yeni yüzyılın başından günümüze kadar süren üçüncü dönem göç; işçilerin, öğrencilerin ve göçmenlerin aile üyelerinin gönüllü göçü ile karakterize edilir. Mültecilerin dönüşündeki azalma nedeniyle bu dönemde göç dengesi yeniden negatif hale gelmiştir. Bu dönemde özellikle ABD'ye dış göçte önemli azalma olmuş, öte yandan Slovenya'ya göç artmıştır. Bosna Hersek'in gelecekteki göç eğilimleri ile ilgili olarak AB'ye ve ABD'ye dış göçün artacağı beklenmektedir (Kacapor ve Oruc, 2012).

Bosna Hersek Doğu ve Batı Avrupa arasında bir geçiş kavşağında yer almaktadır. Bosna Hersek'in AB'ye yakınlığı, çift devlet sistemi, genç göç yönetim yapısı, gözenekli sınırları, esnek vize rejimi ve sınırlı kaynakları bu ülkeyi düzensiz göç, insan ticareti ve kaçakçılığı için bir kaynak ve transit ülke yapmıştır. Ancak Bosna Hersek son dönemde, IOM (Uluslararası Göç Örgütü)'nün de destekleriyle AB standartlarına uygun biçimde yaptığı yasal düzenlemelerle göç yönetim kapasitesinde önemli iyileştirmeler gerçekleştirerek göçü yönetebilir hale gelmiştir.

### 4.2 Makedonya'da Uluslararası Göç Trendleri

Genel olarak Makedonya dış göç alan ve dış göç veren bir ülke konumunda değildir. Ancak AB'ye geçiş açısından transit bir göç ülkesidir. Zira Transit göçün önemli bir oranını, AB ülkelerine girebilmek için Makedonya'ya yasa dışı girişler oluşturmaktadır. Yasa dışı olduğu için transit göçle ilgili güvenilir veri bulunmamaktadır.

Makedonya, Eski Yugoslavya'nın ekonomik yönden en az gelişmiş Cumhuriyetlerinden biridir. Makedonya'da istihdam ve yatırımların yetersizliği, alım gücünün düşüklüğü, işsizlik oranının yüksekliği gibi etkenler yurtdışına yönelen göç hareketinin önemli belirleyicileridir. Bağımsızlığını kazandığı günden bu yana, sosyal ve ekonomik geçiş sürecinde olan bir ülke olarak Makedonya'nın ekonomideki zayıflığı, organize suç ve yolsuzluk sorunları, her şeyden önce transit bir geçiş ülkesi olması, bu ülkeyi insan kaçakçılığı için verimli hale getirerek insan tacirleri açısından hedef ülke konumuna getirmiştir.

AB ülkelerine geçmek için yasa dışı yollarla giriş yapılan Makedonya'da, Makedon vatandaşların kendileri de yasa dışı yollardan Batı Avrupa ülkelerine ve Amerika'ya göç etme mücadelesi vermişlerdir. Özellikle Meksika üzerinden ABD'ye yasa dışı göç esnasında yaşanan olaylar, Makedonların göç hareketlerinin medyada yoğunlaşmasına yol açmıştır (Republic of Macedonia State Statistical Office, 2014). Yaşanan bu gelişmelerin ardından Makedonya'da göç eğiliminde bir azalma olduğu görülmektedir. Nitekim 2006 yılında EWR tarafından yapılan bir çalışmada, Makedonlara yurt dışında çalışmak için gelecek 1 yıllık süre içinde ülkeyi terk etme planları olup olmadığı sorulmuş ve önemli bir çoğunluğun (% 83,5) göç etme eğilimi olmadığı saptanmıştır. Araştırma bulguları göç etme eğiliminde olanların (% 8,2) 25-34 yaşlarında, ortaöğretimini tamamlamış, kentlerde yaşayan erkeklerden oluştuğunu ortaya koymuştur. Ayrıca araştırma bulgularına göre göç etme eğiliminde olanların % 5,5'i de kalıcı göçmen statüsüyle değil, mevsimlik işçi olarak geçici göçmen statüsüyle göç eğilimi taşıdıklarını ortaya koymuştur. Makedonya'dan mevsimlik göçün ise daha çok Yunanistan ve Bulgaristan'a yöneldiği bilinmektedir (Migration Policy Institute, 2007).

Dış göç alma ve dış göç verme oranı yüksek olmamakla birlikte, Makedonya'da kırsal-kentsel göç oranı yüksektir. Bu bağlamda en yüksek göçü Üsküp almıştır. Nitekim almış olduğu iç göç nedeniyle ülke nüfusunun dörtte biri başkent Üsküp'te yaşamaktadır.

Makedonya'dan yurtdışına yönelen göçte 1960'lı yıllarda ülkenin ekonomik olarak yoksul olması etkili olmuştur. Bu dönemde Makedonların göç ettikleri başlıca hedef ülkeler; Almanya, Belçika, İsviçre, İtalya, İsveç,

Avusturya, Danimarka, Hollanda ve Norveç'tir. Aynı şekilde 1990'lardaki zayıf ekonomik performans, Kosova (Sırbistan ili) krizi ve 2001 iç güvenlik krizi de Makedonya'dan yurtdışına yönelen göç oranında artışa yol açmıştır (IOM, 2007a). Bu dönemde Makedonların tercih ettikleri hedef ülkelerin ise Kanada, Avustralya ve bazı Batı Avrupa ülkeleri olduğu görülmektedir. Vatandaşlığa geçiş politikaları farklı olmakla birlikte Kanada ve Avustralya'ya göç edenlerin bu ülkelerin vatandaşı olma eğiliminde oldukları, buna karşın Batı Avrupa ülkelerine göç edenlerin ise bu ülkelerin vatandaşı olma eğiliminde olmadıkları görülmektedir (Migration Policy Institute, 2007).

Son döneme ilişkin veriler sınırlı da olsa, Makedonya İstatistik Ofisi'nin 2005 yılı verilerine göre sadece yasal yollardan göç ettiği saptanan 1282 Makedon'un 518'inin eğitim fırsatları için, 420'sinin ailevi nedenlerden, 85'inin evlenmek için, 41'inin eğitim olanaklarından yararlanmak için ve 218'inin de diğer nedenlerle göç ettiği görülmektedir (IOM, 2007a).

### 4.3 Arnavutluk'ta Uluslararası Göç Trendleri

Doğu Bloğunun çöküşü ve Yugoslavya'nın dağılışı sonrası AB'nin Batı Balkanlara yönelik politikası bölgeye barış, istikrar ve refah getirilmesi amacını taşımaktadır. 1999'dan bu yana izlenen İstikrar ve Ortaklık Süreci (İOS) olarak adlandırılan bu politika bölge ülkelerinin AB'ne tam entegrasyonunu hedeflemektedir (T.C. Ekonomi Bakanlığı, 2011).

Komünizmin yıkılmasından sonra ekonomik ve siyasi çalkantılar Arnavutluk'tan kitlesel göçü körüklemiştir. 1990'lardan itibaren Arnavutluk'un işgücünün % 15-20'sinin Yunanistan ve İtalya başta olmak üzere çoğunlukla komşu ülkelere yasa dışı yollardan kaçak olarak giriş yaptığı tahmin edilmektedir. Bu ülkelerdeki yasa dışı Arnavut göçmenlerin gönderdikleri dövizler halen Arnavutluk'un en önemli döviz girişi olma özelliğini korumaktadır.

Göç kararı çok sayıda ekonomik, psikolojik ve sosyal faktörlere dayalı olmasına rağmen ekonomistler işsizlik ve ücret farklılıklarına odaklanmışlardır. Riskten kaçınan işçiler için en azından kısa vadede hedef ülkedeki istihdam olasılıkları, ücret oranlarından daha önemli bir göç belirleyicisi olabilir. 1990'larda Arnavutluk, Yunanistan ve İtalya'da resmi işsizlik oranları benzer eğilimlerde iken ücret farklılıkları çok fazladır. 1996 yılında tam zamanlı çalışan işçilerin aylık kazançları Yunanistan'da 1800 Dolar ve İtalya'da 2600 Dolar iken Arnavutluk'ta yaklaşık 200 dolardır. Satın alma gücü paritesindeki bu farklılıklar, Yunanistan ve İtalya'nın coğrafi yakınlığı, esnek sınır kontrolleri ve Arnavutların önemli bir çoğunluğunun İtalyanca bilmesi, büyük göçü yaratmak için psikolojik engellerin üstesinden gelmiştir. Yapılan açıklamalar bağlamında Arnavutların göç kararlarının ekonomik olarak akılcı olduğu söylenebilir. Ancak 1995 yılından itibaren bütün olumlu gelişmelere rağmen Arnavutluk büyük bir ekonomik kriz yaşamaya başlamıştır. Kuşkusuz bu krizin yaşanmasında finansal sektörün yeterince gelişmemiş olması, artan hayat standardının yurtdışında yaşayan Arnavut işçilerin dövizlerinden sağlanması, kaçakçılık ve kara para aklama ile kısa dönemli kâr beklentili yatırımlar gibi sorunlar etkili olmuştur (T.C Ekonomi Bakanlığı, 2013).

Arnavutluk ekonomisinde doğrudan yabancı sermaye yatırımında ilk iki sırada Yunanistan ve İtalya vardır. Dış ticaretinde de İtalya hem ihracat hem de ithalatta ilk sırada yer almaktadır. Diğer taraftan her iki ülkeye de Arnavutluk'tan önemli bir iş gücü akımı mevcuttur. Diğer AB ülkeleri, ABD, Avusturya ve Kanada gibi ülkelerde de önemli bir Arnavutluk vatandaşı yaşamakta ve buralardan gönderilen işçi dövizleri ülke ekonomisi açısından önemli bir kaynak niteliği taşımaktadır.

Arnavutluk ile ilgili bir başka önemli veri ülkeye gelen turist sayısıdır. 2010 yılında Arnavutluk'a gelen turist sayısının yaklaşık olarak 3,5 milyon olduğu tahmin edilmektedir. Yabancı ziyaretçilerin en büyük grubunu % 37'lik bir oranla Kosova'dan gelenler oluştururken, bu sıralamayı Makedonya ve Karadağ'dan gelen turistler takip etmektedir (T.C. Ekonomi Bakanlığı, 2011). İstatistikler kayıtlı ziyaretçilerin yüzde 89'unun Arnavutluk'a sadece tatil ya da aile veya arkadaşlarını görmek için geldiklerini göstermektedir. Geri kalanlar ise ülkeye iş için geldiklerini beyan etmişlerdir.

### 4.4 Karadağ'da Uluslararası Göç Trendleri

AB'ye aday diğer geçiş ekonomileri gibi Karadağ Cumhuriyeti'nde de göç istatistikleri ile ilgili düzenli kayıtların olmadığı görülmektedir. Kuşkusuz bu durumda Karadağ'ın bağımsızlığını henüz 2006 yılında ilan etmesinin de önemli bir etkisi vardır. Bu yüzden kurumsal yapılanması oldukça yeni olan bu ülkede göç istatistiklerinin olmaması çok da yadırgayıcı bir durum değildir. Bağımsızlığını ilan ettiği günden bu yana AB'ye katılımı siyasi bir öncelik haline getiren, AB ile entegrasyon beklentileri olgunlaşmış bir ülke olarak Karadağ için AB Göç Müktesebatı uyum için önemli bir ihtiyaçtır.

Karadağ, öncelikle Güney Doğu ülkelerinden Batı Avrupa'ya doğru yönelen yabancı mağdurlar açısından düzensiz göç için transit ve hedef ülkedir. Karadağ sınır kapısından giriş yapan düzensiz göçmenlerin kesin sayısı mevcut değildir. Ancak düzensiz göçmenlerin çoğunun Karadağ aracılığıyla Batı Avrupa'ya geçtiği tahmin edilmektedir. Devlet sınırı arazisinin %92'si dağlık alanlar üzerinde uzanan Karadağ'ın, yasa dışı geçişler için elverişli koşullar sağladığı bilinen bir gerçektir. Ancak Karadağ'da düzensiz göçe ilişkin veri olmamakla birlikte düzensiz göçmenlerin önemli oranda Balkan kaynaklı olduğu tahmin edilmektedir. Nitekim Karadağ, "Balkan Rotası" içinde yer alan transit Balkan ülkelerinden biridir. Karadağ İçişleri Bakanlığına göre Karadağ,

çoğunlukla Arnavutluk ve Sırbistan vatandaşlarının AB'ye geçmek için kullandığı transit göç yolu ile karakterize edilir (IOM, 2007b).

Karadağ, göç veren ülke konumundan, ihtiyaç duyulan politikaların uyarlanması sayesinde göç alan ülke konumuna gelmiştir. Karadağ'ın elde ettiği son makro-ekonomik istikrar ve yabancı yatırımların artması ülkeye gelen göçmen işçi sayısının artmasına yol açmıştır. Göçmen işgücünün % 90'ının ekonomik nedenlerle Karadağ'a geldikleri düşünülmektedir.

Karadağ'daki göçmenlerin çoğunluğunu "Batı Balkanlar" bölgesi kaynaklı diğer ülkelerden gelen göçmenler oluşturmaktadır. Karadağ İstihdam Kurumuna göre, göçmen işçilerin %56'sını Sırbistan'dan, %27'sini Bosna ve Hersek'ten, %11'ini Kosova'dan %3'ünü Makedonya Eski Yugoslav Cumhuriyeti'nden gelenler oluşturmaktadır. Geriye kalan % 3 oranındaki göçmen işçinin ise geldikleri ülkeler bilinmemektedir.

Günümüzde Karadağ işgücü piyasasının önemli bir özelliği de mevsimlik göçmen işçilerin yoğunluğudur. Bu yoğunluk daha ziyade turizm, gıda ve tarım sektöründe görülmektedir (IOM, 2007b).

Karadağlıların göç ettikleri başlıca hedef ülkeler ise Kanada, Fransa, Almanya, Lüksemburg, İsveç, İsviçre ve ABD'dir.

### 4.5 Sırbistan'da Uluslararası Göç Trendleri

Dünya Bankası 2010 verilerine göre Sırbistan'ın uluslararası göçmen stoğu 7.21 olarak ölçülmüştür (525.388'dir). Sırbistan Nüfus Bürosuna göre 2010 yılında net göç hızı 0'dır. Ancak Güney-Doğu Avrupa Çalışma ve Sosyal İşler İnceleme 2005 Raporu sonuçları Sırbistan'da öğrencilerin yaklaşık % 70'inin daha iyi eğitim ve olanaklar için ülkeyi terk etme planlarının olduğunu ortaya koymaktadır.

Son tahminlere göre Sırbistan sınırları dışında yaşayan Sırp asıllı kişilerin 3,2 milyon ile 3,8 milyon arasında olduğu tahmin edilmektedir.

Batı Avrupa'ya giderken transit bir ülke olarak kullanılan Sırbistan açısından dış göç, farklı göç dalgaları ile karakterize edilebilir (IOM, 2008):

- 19 yüzyılın sonundan 1941'e kadar ekonomik dış göç,
- Anti Komünist rejim üyelerinin siyasal göçü (1941-1947),
- Çoğunlukla eğitim düzeyi düşük olan işçilerin 1960-1980'lerdeki ekonomik göçü ve
- 1990'larda eğitim düzeyi yüksek olan bireylerin beyin göçü ile sonuçlanan ve Eski Yugoslavya'dan çok sayıda mültecinin siyasi-ekonomik dış göçü.

Sırbistan, dışa göç veren ülkeler konumundan göç alan ülke konumuna dönüşen, bölge ülkeleri arasında yer almaktadır. Son dönemde AB'ye düzensiz giren Sırp vatandaşların sayısında da bir azalma görülmektedir. Sırbistan'daki göçmen işgücünün dağılımı incelendiğinde, Sırbistan'a en çok göç veren ülkelerin Çin, Romanya, Makedonya, Bulgaristan ve Slovakya olduğu; buna karşın Sırbistan'ın en çok göç verdiği ülkelerin ise Almanya, Avusturya, İsviçre, ABD, Türkiye, Hırvatistan, İsveç, İtalya, Kanada ve Avustralya olduğu görülmektedir (IOM, 2008).

## 5 Geçiş Ekonomilerinde ve Türkiye'de Uluslararası Göç Trendleri Karşılaştırması

Geçiş ekonomilerinde göç verilerinin başlıca kaynakları nüfus kayıtları, ikamet veya çalışma izinleri, nüfus sayımları ve bazı durumlarda özel anketlerdir. Doğrudan göç verilerinin yer aldığı göç kayıtları hemen hemen hiçbir geçiş ekonomisinde tutulmadığı gibi göç verilerinin elde edildiği tüm kaynaklarda, gizli ve yasal olmayan yollardan yapılan göçlere ilişkin hiçbir veriye de yer verilmemektedir.

İnsani Gelişme Raporu'nda (2013) ise uluslararası göç trendleri bazı kavramlar çerçevesinde değerlendirilmektedir. Uluslararası göç trendlerinin değerlendirilmesinde başvurulan bu kavramlar şu şekilde sıralanabilir:

*Uluslararası Göçmen Stoğu:* Uluslararası göçmen stoğu, mültecileri de içeren yaşanılan ülke dışında doğan insan sayısını ifade eden bir kavramdır. Uluslararası göçmen stoğunu tahmin etmek için belirli bir zamanda kullanılan nüfus sayımları esas alınır. Tahminlerde yabancı ülke doğumlu nüfus verilerinden yararlanılır.

*Net Göç Oranı:* Bir ülkede belirli bir dönemde her 1000 kişide gelen göçmenlerle giden göçmenler arasındaki farkın oranıdır. Net göç oranının hesaplanması için yaygın olarak kullanılan veriler; sınır istatistikleri, idari kayıtlar, anketler ve sayımlardır.

*Uluslararası Gelen Turist:* Bir ülkede oturma hakkı olmayan ziyaretçilerdir. Uluslararası gelen turist kavramı turistleri, günübirlik gelenler ile gezi amacıyla gelenleri kapsamaktadır.

UNDP İnsani Gelişme Raporuna (2013) göre hazırlanmış Tablo 1'deki uluslararası göçmen stoğu verileri incelendiğinde, göreli olarak yabancı ülkelerde yaşayan göçmen stoğunun en yüksek olduğu ülkelerin sırasıyla Arnavutluk, Bosna Hersek ve Makedonya olduğu görülmektedir. Buna karşın gelen göçmen stoğunun en yüksek olduğu ülkeler ise Karadağ ve Makedonya'dır.

UNDP İnsani Gelişme Raporuna (2013) göre hazırlanmış Tablo 1'deki net göç oranı incelendiğinde ise Sırbistan ve Makedonya dışında tüm ülkelerde net göç oranının negatifleştiği görülmektedir. Bu durumun söz

konusu ülkelerin transit geçiş ülkeleri olmasından kaynaklandığı söylenebilir. Ayrıca net göç oranının negatifleşmesinde bu ülkelerin göç veren ülke konumundan göç alan ülke konumuna geçmeleri de etkili olmuştur.

| Ülkeler | Göçmen Stoğu (Giden) | Göçmen stoğu(Gelen) | *Net Göç Oranı* | Uluslararası Gelen Turist | Gelen 2005-2010 | Giden 2005-2010 | İşçi Dövizleri girişi | İşçi Dövizleri Çıkışı |
|---------|------|------|------|--------|--------|------|-------|------|
| Karadağ | 0.0 | 6.8 | -0.8 | 1,088 | … | … | 7.32 | 0.67 |
| Makedonya | 21.9 | 6.3 | 0.2 | 262 | … | 23.3 | 4.25 | 0.25 |
| Sırbistan | 2.0 | 5.3 | 0.0 | 683 | 104.4 | 32.1 | 8.72 | 0.18 |
| Arnavutluk | 45.4 | 2.8 | -3.0 | 2,417 | 224.3 | 23.6 | 9.75 | 0.20 |
| Bosna Hersek | 38.9 | 0.7 | -0.5 | 365 | 213.8 | 49.6 | 11.44 | 0.33 |
| Türkiye | 5.6 | 1.9 | -0.1 | 27,000 | 57.8 | 43.4 | 0.12 | 0.02 |

**Tablo 1.** *Uluslararası Göç ve İşçi Dövizleri Trendleri* **Kaynak:** *Human Development Report, 2013. HDR.*

Tablo 1'de de görülebileceği üzere, AB'ye aday geçiş ekonomileri ile karşılaştırıldığında Türkiye'ye gelen uluslararası turist sayısının yüksekliği dikkat çekicidir.

Uluslararası Para Fonuna göre Bosna Hersek'te diaspora gelirlerinin ülkenin GSYİH'si içindeki payı oldukça yüksektir. Nitekim Tablo 1'de de işçi döviz girişinin en yüksek olduğu ülke Bosna Hersek'tir.

Bosna Hersek'ten sonra işçi döviz girişinin en yüksek olduğu ülkenin Arnavutluk olduğu görülmektedir. Göç ve işçi dövizlerinin oranları Arnavutluk'u Doğu Avrupa'da benzersiz kılmakta ve göçmenlerden gelen işçi dövizleri Arnavutluk ekonomisi açısından hayati bir önem arz etmektedir. İşçi dövizleri komünizmin çökmesinin ardından Arnavutluk'un ekonomisinde önemli bir etken olmuştur. İşçi dövizleri ekonomik kriz döneminde hem piyasadaki talebi destekleyerek hem de özel sektörün gelişimini teşvik ederek yaşam standartlarını korumada önemli bir rol oynamıştır. Aynı zamanda göç ve yurt dışından gelen işçi dövizleri, işgücü arzında azalmaya bağlı olarak işsizlik oranının azaltılmasında da etkili olmuştur. Arnavutluk'ta ortalama olarak işçi döviz gelirleri ülkenin GSYİH'sinin % 10'u ile % 15'ini oluşturmaktadır. Sonuçlar, göçmenlerin varlığının veya yurt dışından gelen işçi dövizlerinin erkeklerin işgücüne katılımını etkilemediğini, buna karşın kadınları daha az çalışır hale getirdiğini ortaya koymaktadır. Nitekim Arnavutluk'ta kadınların işgücüne katılım oranı 1991 yılında % 84 iken, 1996 yılında % 59'a düşmüştür. Bu düşüş hanelere büyük oranda işçi dövizlerinin girmesiyle açıklanmaktadır (Konica ve Randall, 2005).

2013 Yılı İnsani Gelişme Raporu'na göre Arnavutluk'tan sonra işçi dövizleri girişinin en yüksek olduğu ülke Sırbistan'dır. Dünya Bankası 2004 yılında işçi dövizlerinin değeri açısından 11 Güney Doğu Avrupa ülkeleri arasında en yüksek sıraya Sırbistan'ı yerleştirmiştir. İşçi dövizlerinin geldiği ülkeler önem sırasına göre; Almanya, İsviçre, ABD, Avustralya, Hırvatistan ve Rusya Federasyonu'dur.

Karadağ'da da işçi dövizleri girişi dikkat çekici orandadır. Karadağ Merkez Bankasına göre işçi dövizleri dış finansman içinde önemli bir kaynak ve ekonomik kalkınma üzerinde olumlu bir etkiye sahiptir. Karadağ'a gelen işçi dövizlerinin oranı son 6 yılda artmış ve bugün GSYİH'nin % 7,3'ünü oluşturur hale gelmiştir. Benzer şekilde Makedonya'da da işçi dövizlerinin oranı GSYİH'nın % 4,2'si civarındadır ve bu ülkede göreli olarak işçi döviz çıkışı oranları diğer ülkelere göre düşüktür.

2013 yılı İnsani Gelişme Raporu'na göre AB'ye aday geçiş ekonomileri içerisinde işçi dövizlerinin GSYİH içindeki oranının en düşük olduğu ülke Türkiye'dir. Türkiye'de işçi dövizlerinin GSYİH içindeki payı % 0.12'dir. Aynı şekilde Türkiye'de işçi döviz girişi gibi, işçi döviz çıkışı da AB'ye aday geçiş ekonomilerinden daha düşüktür.

Göçmen işçiler tarafından genelde göç veren ülkede kalan çekirdek aile bireylerine gönderilen döviz havaleleri, göçün en dolaysız yararlarından biridir ve yerel ekonomilere yayılarak kazanımın yaygınlaşmasını sağlamaktadır. Göç veren ülke için de döviz geliri işlevi görmektedir. Ancak göçmen döviz havalelerinin dağılımları eşit değildir. Örneğin 2007 yılında dünya genelinde göç veren ülkelere gönderilen toplam 370 milyar ABD doları tutarındaki göçmen işçi dövizlerinin yarısından çoğu orta insani gelişme düzeyindeki ülkelere, % 1'inden daha azı da düşük insani gelişme düzeyindeki ülkelere gitmiştir. Aynı yıl Türkiye'ye 1.209 milyar ABD doları göçmen işçi döviz havalesi yapılmıştır. Türkiye'de kişi başı ortalama havale ise 16 ABD dolarıdır. Buna karşın Orta ve Doğu Avrupa ile Bağımsız Devletler Topluluğu ortalaması 114 ABD dolarıdır (UNDP, 2009).

## 6   Sonuç

AB'ye aday tüm geçiş ekonomilerinde göç istatistikleri ile ilgili düzenli kayıtlar yoktur. Göreli olarak dış göçün en iyi şekilde Bosna Hersek'te kayıt altına alındığı görülmektedir. Bu yönüyle Türkiye ile AB'ye üye geçiş ekonomileri arasında önemli bir benzerlik olduğu söylenebilir. İç göç açısından Türkiye'nin en çok

benzerlik gösterdiği ülke Makedonya'dır. Zira Makedonya'nın başkenti Üsküp'te ülke nüfusunun önemli bir çoğunluğunun yaşaması gibi Türkiye'de de nüfusun önemli bir çoğunluğu İstanbul, Ankara ve İzmir gibi metropol kentlerde yaşamaktadır.

AB'ye aday tüm geçiş ekonomileri ile Türkiye'nin bir diğer ortak yanı, hepsinin transit geçiş ülkesi olmasıdır.

İşçi gelirleri, alıcı ülkenin döviz kazanımını arttırırken, gelir seviyesini de yükseltmektedir. Ancak ekonomik kalkınmaya ne ölçüde katkısı olduğu belirsizdir. Göç, kaynak ülkelerin kalkınmasına önemli bir katkı sağlasa da gelişmekte olan ülkelerin büyüme ve refah politikalarına bir alternatif değildir. Bu bağlamda AB'ye aday geçiş ekonomileri ve Türkiye'de işçi dövizi girişinin GSYİH içindeki payı ne olursa olsun, büyüme ve refahı tek başına arttıramayacağı, ancak diğer sosyal ve ekonomik ölçütlerle birlikte kalkınmaya katkısı olacağı ifade edilebilir. Kalkınmaya ne ölçüde katkısı olduğu belirsizse de, işçi dövizi girişlerinin geride kalan ailelerin gelir seviyesinin yükselmesine ve insan sermayesinin gelişimine katkıda bulunduğu açıktır.

# Avrupa Birliği Göç İlişkileri: Makedonya Odaklı Bir Analiz

# European Union Migration Relations: An Analysis Focused on Macedonia

Assoc. Prof. Dr. İlyas Sözen (Beykent University, Turkey)

Ph.D. Candidate Fatih Çam (Beykent University, Turkey)

Asst. Prof. Dr. Volkan Öngel (Beykent University, Turkey)

## Abstract

In the research, the process of the European Union, a candidate, a new member and a negotiating country's migration experiences are compared (Macedonia, Bulgaria and Turkey). The results of this study are thought to be very important for Macedonia, which is not already negotiating for EU membership, in that it presents the difficulties Macedonia is facing on the way to EU membership. As for the methodology, after the theoretical descriptions which define the borders of the subject are done, economic, politic-legality and social dimensions of international migration are examined. Looked from this point of view, in this study, it is foreseen that becoming an EU member can be a solution to primarily migration "issues" and ethnic conflicts. In the evaluation of the findings which seem to support this hypothesis, the changes seen in the immigration and emigration dynamics of Bulgaria after it was admitted to EU are accepted as valuable data which determine the motivation of this study.

## 1 Giriş

Uluslararası göç hareketleri, son yarım yüzyıl boyunca tüm dünyayı etkileyecek biçimde, farklı etkenlere dayanan ve sosyal açıdan yüz milyonlarca insanı ilgilendiren bir konu olmaya devam etmektedir. Göç konusu kimi zaman devletler kimi zaman da sivil toplum örgütleri ve sosyal bilimciler tarafından ele alınmış, kuramsal açıdan değerlendirilmiştir. İlgili devlet ya da toplumun gelecek ile alâkalı beklentilerine hizmet edecek biçimde çözümler üretilmektedir. Bu sebeple, bu çalışma içerisinde özellikle İkinci Dünya Savaşı sonrasında hızla gelişen uluslararası göç, sosyal bilimlerin çeşitli disiplinleri tarafından ve kuramlar temelinden incelenmeye çalışılmıştır.

Bu çalışmada, göç olgusu, Makedonya, Bulgaristan ve Türkiye kökenli toplulukların soğuk savaş sonrasından günümüze kadar gerçekleşen ulusaşırı göçlerin nedenleri ele alınmıştır. İkinci Dünya Savaşı sonrasında Batı Avrupa gibi homojen bir demografik yapıya ulaşamamış, kısmen komünizm etkisinde ve/veya çok etnikli yapıya sahip ya da dağılmış bir büyük devletin mirası üzerine kurulmuş Doğu Avrupalı üç ülkenin göç hareketlerinin nedeni Makedonya analizi üzerinden değerlendirilmiştir. Tarih ve etnisite bağlamında reel kök ilişkileri bulunan üç ülkenin seçilmesinde özellikle komünizmin çöküşünden sonra hızlanan göç hareketlerinin Balkanlar'da değişen dengeler üzerinde hassas bir işleve sahip olması gerçeği yatmaktadır. Bu bağlamda Makedonya'nın göç olgusunun iktisadi, sosyolojik ve mevzuat bağlantılı sebep ve sonuçları araştırılmaya çalışılmıştır.

## 2 Göç Hakkında Paradigmalar

Uluslararası politik ekonomi içerisinde göç olgusunu "teoriler temelinde" birçok açıdan ele almak mümkündür. Bu sebeple tarihi gelişim içerisinde günümüze kadar uluslararası politik ekonomide ulus devletlerin göç ve güvenlik ile ilgili davranışlarını açıklamakta en çok başvurulan yaklaşımlara değinilecektir. Sosyo-ekonomik odaklı dünya sistemi parametrelerinin belirlediği ve günümüzde yaygın olarak kabul edilmiş olan göç kuramlarından kısaca bahsedilmiştir.

Dünya üzerinde özellikle Soğuk Savaş döneminin sonuna kadar hakim olan Realist yaklaşım, olayları açıklamaya çalışan en yaygın teorilerden biridir. Ancak "realizm ekolü, gerek devlet dışındaki aktörlerin varlığını reddetmesi dolayısıyla çağdaş sistemin doğrularıyla çelişmesi, gerekse de devletlerin yekpare birimler olarak ele alınması yolu ile devlet içerisinde yer alan siyasal farklılıkları gözardı etmesi sebebi ile eleştirilmektedir" (Sönmezoğlu 2005, 555). Realist bakış açısının temel argümanını oluşturan "güç" kavramı, bireyin ve toplumun ihtiyaçlarını yok sayma eğilimdedir. Realistlere göre, uluslararası ilişkilerde asıl belirleyici olan "karşılıklı çıkar mekanizması" diyalektiği içerisinde birey, göç olgusunun yalnızca bir öznesi konumunda değerlendirilmektedir. "Ulusal güvenliğe tehdit olarak görülebilen unsurların küreselleşme sürecinde toprak bütünlüğü ya da siyasal bağımsızlığın dışında ekonomik bağımsızlık, kültürel kimlik veya toplumsal istikrar gibi yeni değerlerin korunması gerekliliği artık kabul görmüştür" (Kicinger ve Katarzyna 2004).

Uluslararası sistemi ekonomik ve ticari faaliyetlerle bağlantılı kavramlar ile açıklayan Dünya Sistemi'ni anlamak için onun tarihi gelişimine bakılmalıdır. Modern Dünya Sistemi olarak tanımlanan uluslararası sistemin temel özelliği kapitalist olmasıdır. Modern Dünya Sistemi anlayışı küresel yapıyı merkez ve çevre (*periferi*) olarak iki gruba ayırmaktadır. Bu yapıda yoksul ülkelerden sürekli olarak zengin ülkelere bir artı değer transferinin (kısaca ticaret) varlığı, zenginleri daha zengin yaparken yoksullar giderek daha da yoksullaşmaktadır (Arıbaş 2007, 785). Modern Dünya Sistemi, politik-ekonomik bir etkinliğe dikkat çekmesi açısından göç ile

bağlantılı hareketlerin açıklanmasında temel araç olabilir. Ancak, dünya üzerindeki ticari ağların varlığı göç için tek sebep sayılamaz.

Özellikle, Soğuk Savaş sonrası dönemde Doğu-Batı ayrımının yerine Kuzey ülkelerinin kendi aralarındaki ekonomik rekabetinden dolayı Kuzey-Güney ayrımı meydana gelmiştir (Arı 2002, 270). "Küreselleşmenin hangi nedenlerle ortaya çıktığı, bu süreçte hangi güçlerin etkili olduğu, bu süreçten hangi toplumsal grupların en fazla yararlandığı" gibi bir dizi soru çıkmaktadır. Küreselleşmenin en önemli sonuçlarından biri uluslararası göçlerin yeni kimlikleri, bölünmüş kişilikleri ortaya çıkmasıdır (Abadan-Unat 2006, 7). Merkez-çevre arasında cereyan eden ticari ilişkiler üzerinden de ele alınan göç olgusu, Globalist görüşe göre küresel mobilitenin en büyük gerekçesi olarak değerlendirilmektedir. Sayılarla ifade etmek gerekirse, Uluslararası Çalışma Örgütü'nün (*ILO*) göç istatistikleri incelendiğinde 98 ülkenin 24'ünün hem göç veren hem de göç alan, 31'inin sadece göç veren, 43'ünün ise sadece göç alan ülke konumunda olduğu görülmektedir. Böylesine geniş bir mekânsal varlık gösteren göç olgusunun küreselleşme ile ilişkisini ortaya koyan şu tespitleri yapmak mümkündür (ILO 2012, 4);

- Emek göçmenlerinin yarısından fazlası, mültecilerin ise bundan daha yüksek bir oranı; Asya, Afrika ve Latin Amerika menşeilidir.

- Dünyada seksenli yıllarının sonundan itibaren değişen siyasi, ekonomik ve toplumsal yapı; eski sosyalist ülkelerin nüfuslarını da gelişmiş kapitalist ülkelerin kullanımına hazır bir işgücü rezervuarı haline getirmiştir.

Kapitalist düşüncenin dayandığı felsefi temel liberalizmdir. Liberalizm, insanların diledikleri gibi hareket etmeleri ve ekonomik alanda tam bir serbestliğe sahip olmaları gereğine olan inancını açıklamaktadır. Ancak klasik liberalizm ekonomik anlamda, girişimci sınıfın çıkarlarını koruyup geliştirmeyi amaçlar. Dolayısıyla, işgücü göçüne ihtiyaç duyan sermaye sahiplerinin çıkarlarının maksimize edilmesine hizmet etmektedir. Politik anlamda da, "gece bekçisi devlet anlayışını" savunur. Bu özellikleriyle de "sosyal liberalizm" ve "yeni liberalizm'den" ayrılmaktadır. Sallan-Gül, son otuz yılın hâkim yaklaşımı olan yeni liberalizmin sakıncalarını söyle açıklamaktadır. "Yeni liberal yaklaşım, bireylerin sahip oldukları özgürlükleri kullanabilmeleri için eylem, yetenek ve güçlerinin artırılmasının, bireyin özgürlüklerinin artması anlamına gelmeyeceğini iddia etmektedir. Bu yaklaşımda özgürlük, siyasi otoritenin ya da egemenin iznine ve değerlerine bağlı olarak geliştirilen objektif bir ilke etrafında şekillendirilebilir" (Sallan-Gül 2009, 91). Sallan-Gül, yukarıdaki açıklamalarıyla, yeni liberalizmin de klasik liberalizm gibi bireyin mobilite özgürlüğünü kısıtlarken sermaye hareketlerinin serbestliğini savunmaktadır.

Neoklasik Ekonominin Makro Kuramı, uluslararası göç hareketlerinin ekonomik gelişim parametreleriyle açıklamaya çalışan en eski kuram olarak kabul edilir. Kuram göçleri emek arzı ve talebi arasındaki coğrafi farklılığa dayandırmaktadır. Sjaastad ve Borjas tarafından geliştirilen göç modellerinde ise, akılcı düşünce sistemleri kullanılarak maliyet/kâr hesabı yapılmalı ve sonucunda göçe karar verilmelidir. Todaro- Harris ise göçün temel nedenini verimlilik farklılığı üzerine kurmuştur. Yeni Ekonomi Kuramlarına göre, önceki kuramlara karşıt olacak biçimde "göç etme kararı tek tek bireyler tarafından değil, bir hane halkının tüm fertleri hatta bazen bir topluluğun tümü gibi birbiri ile ilintili çok sayıda kişi tarafından alınmaktadır". (Abadan-Unat 2006, 22-24) Özellikle etnik çatışma yaşanan bölgelerdeki bireylerin yabancı bölgelere göçte aile bağları güçlü yerleri tercih etmektedirler.

İkiye Bölünmüş Emek Piyasası Kuramı göç hareketinin modern sanayi toplumlarının işgücü talebi doğrultusunda meydana geldiğini savunur. Bu teorik yaklaşımın öncülerinden Michael J. Piore, uluslararası göçün, sürekli işgücü talebinden kaynaklanan ekonomik temelli olduğu iddiasındadır. Dünya Sistemleri Kuramı'na göre "geçime dayalı tarım yerini nakit karşılığında üretilen mahsullere bırakınca, birçok tarım işçisi işsiz kalmaktadır. Böylece yerel tarımsal topluluklar da zayıflamaktadır. Küresel pazarlarda satışa çıkan hammaddelerin üretimi, ücretli emeğe dayalı sınai yöntemler gerektirmektedir. Bu süreç bölgeler arasındaki nüfus akışkanlığını, dolayısıyla göç etme hevesini de artırmaktadır" (Abadan-Unat 2006, 31). Eleştirel teori realistlerin aksine, "Uluslararası göçü, 'merkez-yarı çevre-çevre' şeklindeki Dünya Sistemleri Teorisi gibi bir yaklaşımla açıklanmak yerine, göçmenlerin göç sürecinde geliştirdikleri sosyal, siyasal, ekonomik ve ticari ağların ışığında mikro düzlemlerde" açıklamaktadır (Kaya ve Şahin 2007, 25).

İlişkiler Ağı Kuramı, göçe neden olan faktörleri açıklamaktan ziyade "zaman-mekân" açısından devam etmekte olan göç olgusunun ortak köken, soydaşlık veya dostluk bağlarıyla oluşan kişiler arası ilişkileri inceler. Bu ilişkilerin varlığı göçü özendiren, kaynak mekân ile hedef mekan arasında eskilerle yenilerin bir tür yazılı olmayan antlaşması olarak değerlendirilir (Massey ve Garcia Espana 1987). Kümülatif Nedensellik Kuramı ise, göç olgusunu çok çeşitli boyutlarıyla ele alır. Özellikle işaret ettiği nokta ise göç alan hedef ülkelerdeki bazı iş alanlarının uzun süreçler sonunda göçmen işi olarak tanımlanmalarıdır. Yerel halk tarafından bu iş alanlarının hor görülmesi dolayısıyla göç akımlarının güçlenmesi ve beslenmesi sonuçlarını doğurur. Yüksek sayıda göçmenin bir iş kolunda istihdam edilmesi halinde bu işin türü "göçmen işi" olarak nitelendirilmekte ve söz konusu iş, yerliler tarafından benimsenmemektedir. Hedef ülkelerdeki belirli işlerin (temizlik işleri, çocuk bakıcılığı, hasta bakıcılık), akrabalık veya hemşehrilik ilişkileri kapsamında parsellenerek sahiplenilmesi buna örnek gösterilebilir. (Böhning 1994, 1492).

Uluslararası göç hareketlerini açıklamak için oluşturulmuş kuramlar birçok farklı sebebe dayandırılmaktadır. Bu nedenle kuramsal alt yapının incelenmesi hususunda, benzer gerekçelerle sınırlılıklar meydana gelmektedir. Örneğin, her kuramın içerdiği hipotez ve önermeler farklı göç politikalarının meydana gelmesine neden olabilir. Bu çalışmada tartışılan kuramlar göç kuramlarının tamamını yansıtmamaktadır. Çalışamda genel anlamda globalist yaklaşım ele alınacaktır.

## 3 Uluslararası ve Yasadışı Göçe Neden Olan Faktörler

Afoloyan, göçün sebepleri; nüfus artışı ve nüfus yoğunluğu, ekonomik kırılganlık ve borç, sosyokültürel meseleler, çevre felaketleri, sosyal ağlar, hükümetlerin göç politikaları ve bölgesel ekonomik entegrasyonlar olarak kabul eder (Afoloyan 2001, 10). Afrika örneğinde Adepojou, göç faktörlerini; işgücü artışı, ekonomik düşüş ve borç, etnopolitik çatışmalar, ekolojik bozulmalar başlıkları altında toplar. Bu bağlamda göç, bireyler ve aileler için bir hayatta kalma stratejisi olarak görülebilir (Adepojou 2004, 65). Aile yapısının kırılgan ve çevresel koşullara olan bağımlılığı göç ilişkileri kuramları içerisindeki farklılıkların meydana gelmesinde başlıca etken olarak gösterilebilir.

Uluslararası göçte artış nedenleri olarak; gelişmekte olan veya geri kalmış ülkelerdeki hızlı nüfus artışı, buna bağlı olarak gelişen olumsuz ekonomik koşullar, işsizlik, iletişim ve ulaşım olanaklarının artması, iç savaşlar, siyasi istikrarsızlıklar, terörizm, küresel pazar haline dönüşmüş olan insan ticareti, yasadışı göçmen kaçakçılığı ile mücadelede fiziksel/ yasal engellerin yetersizliğidir. Listenin bütününe bakıldığında düşük gelir veya diğer bir ifadeyle yoksulluk içerisindeki insanların büyük umutlar besleyerek yasal ya da yasadışı olarak yaşadıkları yerleri değiştirdikleri de görülmektedir. Yasadışı göçle mücadele ve düzenleme programlarının varlığına rağmen, yasadışı yabancı sayılarının durağan ya da artan miktarlarda olduğu tüm dünyada kolaylıkla görülebilmektedir. (Martin 2003, 6).nKüresel göç nüfusunun büyük çoğunluğu yeryüzünün güney bölgelerinden Batı Avrupa, ABD ve Kanada başta olmak üzere Kuzey bölgelerine göç etmek zorunda kalan insanların göç hareketleri sonucunda meydana gelmektedir. Bu nüfusun daha küçük bir kısmı ise coğrafi olarak olmasa da sosyo-ekonomik gelişmişlik ve kültürel "kimlik" açısından Kuzey ülkesi sayabileceğimiz Avustralya'ya; yine başka bir kısmı ise petrol ihraç eden Ortadoğu ülkelerine göç edenlerden oluşmaktadır (Massey 1988, 233).

## 4 Göç İlişkilerinin Açıklanmasında İktisat Yönlü Paradigmalar

Göç konusundaki eski literatür (Ravenstein 1885) bazı çağdaş demografik literatürde de nüfus artışının göç eğilimi ile direk bağlantısı olduğunu varsaymaktadır. Başka bir deyişle; yüksek doğum oranı yüksek göçe yol açarken düşük nüfus artışı dışarıdan göçe ihtiyacı doğurabilir. Ancak, bunların arasında küresel olarak hiçbir bağlantı olmadığını gösteren yeterli ampirik kanıtla birlikte göç üzerine bu yaklaşım terk edilmiştir. Gelişen dünyanın çoğunu kapsayan yüksek verimlilik oranlarına sahip ülkeler için önemli olan ekonomilerinin yeni işgücünü absorbe edebilme kapasitesidir. Gelecekteki göç baskıları için hayati belirleyiciler, basit nüfus artışlarından ziyade istihdam yaratımı olacaktır. Son çalışmalar gönüllü uluslararası göçü bir gelişim seviyesi olarak görme eğilimindedir. Bu seviye çok düşük bir gelişmişlik seviyesinden "orta-üzeri" gelir düzeyine geçişi göstermektedir. Bu görüşe göre göç gelişmemişlikten değil, gelişimin kendisinden ortaya çıkmaktadır. Genellikle; dünyanın ana işgücü ihracatçıları Kuzey Afrika veya Filipinler gibi orta gelir düzeyine sahip ülkelerdir (Haas 2005, 678). Olesen, bu düşük ve orta gelir düzeyine sahip ve yüksek göç oranına sahip ülkeleri "göç toplulukları" olarak adlandırmaktadır. Bu ülkelerin bir üst seviyesindeki ülkelerden dışarıya göç azalmaya başlar. Olesen, göç alan ve göç veren ülkeler arasındaki bu gelir seviyesini açıklarken (Amerikan doları satın alım paritesi ölçü birimi kabul edilerek) değişim oranlarını 1/3'ten 1/4,5'a kadar varsayar (Olesen 2002, 125-150).

Üretim faktörleri arasında en önemlilerinden biri olarak kabul edilen işgücü ihtiyacı, göç konusunun da temel belirleyicisidir. Kolonyel eğilimli ülkeler, işçi ihtiyacını başlangıçta Afrika üzerinden kölelik düzeneğiyle karşılayarak, tarım işçisi ve hizmet alanlarında kullanmaktaydılar. Sanayi devrimiyle birlikte işgücü ihtiyacı şekil değiştirmeye başlamıştır. Değişikliğin sonuçlarından birisi de, daha nitelikli işçi grupları tarafından oluşturulan örgütlü yapılardır. Bu durumda devletler; ücret, işçilerin serbest dolaşımı ve göç konularında, kolonileşme sonrası alışkanlıklarını terkederek yeni kontrol mekanizmaları geliştirmeye başlamışlardır. Özellikle Batı Yarımküre'de yaklaşık ikiyüz yıl önce başlayan endüstri atılımlarının ardından ekonomik faaliyetler süratle tarım dışına kaymıştır. İşletmeler ve fabrika sahipleri yığınlar halinde işçi istihdam etmeye ve onlara düzenli olarak ödemeler yapmaya başlamıştır. Kalabalıklaşan nüfusun ihtiyaçlarını karşılayamayan tarım kesimi bu kalabalıkların bir kısmını dışarı atmak zorunda kalmıştır. Bununla birlikte taşrada tarımsal ürünlerin fiyatları da düşmeye başlamıştır. Tam tersine, şehirlerde hizmet veya endüstri sektörlerinde çalışanlar düzenli gelire sahip olmanın garantisi altında yaşamaya başlamışlardır (USAK 2008, 263).

Artan ekonomik yatırımların büyük oranlarda kentlerde yapılması hem kentlerin büyümesinde etkili olmuş hem de tarım faaliyetleriyle uğraşan kesimin verimliliğini dolaylı olarak düşürmüştür. Tarım verimliliğinin gerilemesi ve kentleşme arasındaki bu ters orantı diğer kamusal alanlarda da kendini göstermiştir. Eğitim, sağlık ve altyapı hizmetleri gibi hizmetlerin de kentli insana daha yakın olması, yatırım politikalarının bir sonucu

olarak değerlendirilebilir. Gelişen teknolojiyle birlikte tarımda kullanılan eski usul uygulamaların yerini makineler almaya başlamıştır. Bunun birlikte tarım alanında işgücü fazlası meydana gelmiştir. 20. yüzyılda küresel göç hareketlerini belirleyen en önemli dinamikler bir taraftan dünyanın fakir bölgelerinde meydana gelen yoksulluk ve işsizlik gibi sebeplerden kaynaklanan göçmen arzı iken diğer yandan gelişmiş bölgelerdeki işgücü açığını göçmenlerin ucuz işgücü emeğiyle kapatmaya dayalı ekonomik yaklaşım olmuştur (ORSAM 2012, 10).

Göçle ilgili iktisat yönlü yapılmış çalışmalar yeni ekonomi kuramı temelinde modern açıklamalar içeren düşünceleri günümüzde paylaşmaya devam etmektedirler. Göç-,iktisat ilişkisi değişkenler üzerinden ele alındığında başlıca belirleyicinin istihdam olduğu göze çarpmaktadır. Ancak bu durumda genellikle istihdam konusunda birey değil, hane halkı ve/veya üretim, tüketim alanlarında bir birlik oluşturan çoğul özneler kastedilmektedir. Aynı birliği oluşturan öznelerin toplam okur-yazarlık oranları ve göç olgusunun kadınsallaşması da modern açıklamaların başlıca argümanlarını oluşturmaktadır. Bunun yanında spesifik temel ekonomik göstergeler de ülke bazında oluşturulan raporlarda kuramsal yaklaşımdan farklı tablolar meydana getirmektedir. Ayrıca iktisadi açıklamaları desteklemek açısından temel sosyal göstergelerden de sıklıkla yararlanıldığını belirtmek gerekir.

## 5 Avrupa Birliği Göç İlişkisi: Makedonya Analizi

Kıta Avrupası'nın bir uzantısı olarak kabul edilen Balkanların, ekonomik ve siyasi parametreler göz önünde bulundurulduğunda, Ortadoğu ve Asya'ya açılan bir kavşak konumunda olması bölgenin AB açısından önemini bir kat daha artırmaktadır. Konu, sadece jeostratejik açıdan değil reel kök ilişkileri bağlamında da ele alındığında, etnopolitik ve dini hassasiyetlerin yüksek bir seviyede olduğu görülecektir. AB tarafından dini ve siyasi bir parça olarak görülen ve yıllarca komünizm etkisinde, nüfuz edilememiş bir şekilde kalmış bölgenin mevcut ilgiyi neden bu kadar çektiğini anlamak zor değildir. Günümüz koşullarında AB'ye, görece yeni üye olan Bulgaristan, eski ile yeni sistem arasındaki geçişi büyük oranda sorunsuz bir biçimde gerçekleştirmeyi başarmıştır. Bu örnek, araştırmanın karşılaştırma esasları bakımından referans noktasını oluşturmaktadır. Bununla birlikte, bölgede Makedonya, Bosna-Hersek ve Sırbistan gibi Yugoslavya dağıldıktan sonra özgürlüğüne kavuşan devletlerde yüksek gerilimli atmosferin varlığı devam etmektedir. Bu koşulların, ekonomik olarak geri kalmışlığa ve sosyal kalkınmanın yavaşlamasına sebebiyet verdiği, dolayısıyla göç trendlerini etkilediği değerlendirilmektedir. AB genişlemesinin son periyodunda, muhtemel adayların ve yeni üyelerin "geri" olarak nitelendirildiğini ve kaynak ülke olarak tanımlandıklarını görmekteyiz. Eski kurucu üyeler tarafından belirlenmiş olan, "her yeni katılım, üye için koşulsuz bir tam üyelik anlamına gelmez" ortak yaklaşımı beşinci genişleme paketinde de tekerrür etmiştir. Bu yaklaşımın sonucu olarak yeni üye Bulgaristan, ancak 2014 yılı başından itibaren serbest dolaşım hakkına erişebilmiştir. Aynı uygulamanın diğer aday ülkeler için de benzer şekillerde tezahür edeceği öngörülmektedir.

AB'nin beşinci genişleme süreci hedefinde bulunan Orta ve Doğu Avrupalı adayların, ekonomik ve siyasi açıdan çok farklı sistemlerden geldikleri görülmektedir. AB normları açısından Doğu Avrupalı adayların eski alışkanlıkları bir kenara bırakarak, "şarta bağlılık kuralları" (bkz. Dinç 2012) çerçevesinde büyük değişimler geçirmesi gerekmektedir. Bu durum hem adaylar ve müzakere yürütenler hem de yeni üyeler için geçerlidir. Üyelik sürecinde, işleyen bir piyasa ekonomisine ve demokrasiye geçmek için yerine getirmesi gerekenler, AB üyesi devletler tarafından sıkı sıkıya denetlenmektedir. Bu kapsamda süreç, mevcut üyelere doğru olası bir göç akınını, istihdam yapısına muhtemel etkilerini ve ekonomik gelişimini kapsamaktadır. Ayrıca adaylardaki iç politik yapı, demokratikleşme, hukukun üstünlüğü, azınlıklar, sınır sorunları ve devlet kapasitesinin artırılması gibi konular önemli başlıklar olarak AB bünyesinde değerlendirilmektedir (Dinç 2012, 79).

***Tablo 1.*** *Balkan Ülkelerinin AB ile Bütünleşme Süreçleri* **Kaynak:** *Fehmi Ağca, (2010), AB Bakanlığı, AB-Türkiye İlişkileri Kronolojisi sitesi ve EU Enlargement sitesinden derlenmiştir.*

Balkanlarda AB'nin genişleme sürecinin özellikle S.S.C.B'nin dağılmasının ardından etnik sorunlarıyla mücadele eden ve son dönemde siyasi anlamda sakinleşen her ülkeye ulaştığı (Türkiye hariç) aşağıdaki tabloda açıkça görülmektedir. Özellikle hala anayasal ve etniksel sorunları çözemeyen Bosna-Hersek ve Kosova izleme aşamasında devam etmektedir. Balkanlardan Hırvatistan üye olarak kabul edilirken Sırbistan ve Karadağ fasıl sürecini devam ettirmektedir. Üyelik süreci devam edenlerde temel sorun; etnik veya dini dağılımın ülke içinde sorunlu olmasıdır.

Çalışmanın alanı içerisindeki üç ülke (Türkiye, Bulgaristan ve Makedonya) ile AB geneli arasındaki refah farkının çok çeşitli sonuçları olacağı öngörülmektedir. Örneğin, "sermaye ve emek görece olarak nerede daha nadir/değerli ise oraya akar" kuralı gereğince sermayenin doğuya, emeğin ise batıya doğru akacağı beklenmektedir (Smaghi 2002, 52). Frontex (2014, 14) verilerine göre yasadışı şekilde 2013 yılında AB'ye 107 bin göçmen girişi olmuşken AB içinde yasadışı 345 bin civarında yasadışı göçmen bulunmaktadır. Genişleme ve olası üyelik hususunda en önemli tartışma konularından birisi de, yeni üyelerden eski üyelere doğru bir göç dalgasının olup olmayacağıdır. Bu konuda çok derin endişeler mevcuttur. Hâlihazırda sorunlu bir istihdam piyasası olan AB içerisinde, yeni üyeliklerin işsizlik sorununu daha da büyüteceği, genişleme karşıtı olanların temel argümanını oluşturmaktadır. Bireysel göç kararının "beklenen fayda eksi maliyet" hesabı üzerinden alındığı düşünülürse, doğu ile batı arasında, üyelikle birlikte göçün artacağı öngörülmektedir. Ayrıca, serbest dolaşımın başlamadığı yeni üye (kaynak) ülkelerden, AB sınırları içindeki müreffeh devletlere doğru yasal olmayan yollardan da bir akım gerçekleşeceği düşünülmektedir. Ancak zamanla, doğu bölgelerindeki bu yeni ülkelerde artan ticaret, istihdam artışı ve ihracat, yabancı yatırımlar gibi nedenlerle göç olgusunun azalacağı tahmin edilmektedir (Dinç 2012,80). Ancak son göç raporlarına göre dünya üzerinde yaşanan göç miktarının üçte biri AB ülkelerine gerçekleştirilmektedir. AB ülkelerinin ekonomileri geliştikçe iş gücüne dayalı göç almaya muhtaç kalacaklardır.

Örneğin, Bulgaristan'ın üyeliğinin gerçeklemesinden önceki (2005 yılı) verilerine göre, o dönemde yeni on üyeden göç eden işçiler AB içerisindeki işgücünün %0,4'ünü oluştururken, bu ülkelerden o tarihe kadar AB içerisinde çalışmak maksadıyla 1,7 milyon iş başvurusu gerçekleşmiştir. Diğer AB üye ülkelerinden gelen işgücü % 2,1 ve AB üyesi olmayan ülkelerden gelen emek gücü ise % 5,1 olarak tespit edilmiştir (Enlargement, 2006). Yapılan çalışmalardaki öngörülerin birçoğuna göre, üyeliklerin ilk yıllarında ortalama 300-350 bin olacak şekilde, onbeş yıllık bir zaman zarfında Merkez ve Doğu Avrupa ülkelerinin nüfusunun yaklaşık % 2 ile % 4'ünün eski üye ülkelere göç edeceği tahmin edilmektedir. İfade edilen oranların sayısal karşılığı 3 milyon insana tekabül etmektedir ki az gibi görünen bu rakamın 2020 projeksiyonlarına göre AB'de çalışabilecek yaşta olanların % 1,2'sine denk düştüğü görülmektedir. Her koşulda eski üyeler içerisindeki ekonomik durgunluk devam ettiği sürece, işsiz seçmenlerce bu durumun hoş karşılanmayacağı açıktır (Avrupa Komisyonu 2006).

Olası göç dalgasının bütün AB kamuoyunca rahatsız edici bulunduğu söylenemez. AB genişlemesi, işgücü ve sermaye hareketliliği sunduğu tehditler kadar fırsatlar da içermektedir. Bunlardan bir tanesi, düşük iş gücü yeteneği olan vasıfsız işçilerin kendilerine göre en fazla zarara uğrayacakları endişesidir. Ancak, gelişmiş iş gücü becerisine sahip kalifiye işçiler ise genişlemenin, daha iyi işler bulmak için bir fırsat olduğuna inanmaktadırlar. Sermaye sahipleri veya girişimciler açısından ise durum daha umut vericidir. Onlara göre, ucuz işgücünün serbest dolaşımından dolayı oluşacak pazarda iş olanaklarının ve karın artacağı inancı hâkimdir (McLaren 2004, 901). Ayrıca Eurostat'ın 2060 projeksiyonuna göre; AB'deki çalışan sayısının bugünkü göç oranı dikkate alındığında 50 milyon kişi civarında azalacağı, emeklilik ödemeleri ve sağlık harcamalarında ciddi sorunlar oluşturacağı kabul edilmektedir. AB'ye doğru yapılan göçün ağırlıklı olarak ekonomik gerekçelerle ilişkisi bulunduğu değerlendirilmektedir (European Union 2012, 69-71). Ancak bu faktör, başlıca etken olarak kabul edilemez. Balkanlardan ve Türkiye'den AB üye ülkelerine doğru yapılan veya yapılması muhtemel göçün sosyo-kültürel, siyasi veya hukuki boyutları da mevcuttur. Göç olgusunun AB içerisinde algılanması ise; siyasal ve güvenlik konularından daha çok ekonomik kaygıların ön planda olduğu anlaşılmaktadır.

AB'nin Balkanlar'a sadece çatışma sonrası sorun çözücü olarak değil, aynı zamanda entegrasyon aracı olarak müdahil oluşuyla 1990'lardaki komünizm sonrası görüntüsünden çok uzaklaşmıştır. Arnavutluk ve bir zamanlar Yugoslavya'yı oluşturan ülkeler ya AB'nin içinde (*Slovenya ve Hırvatistan*) ya da aday olarak (*Makedonya, Karadağ ve Sırbistan*) tanınmıştır. Bölge, bütün demokratik olumsuzluklara, bitirilmemiş işlere ve günümüzdeki ekonomik istikrarsızlıklara rağmen 1990'lara göre çok iyi durumdadır. Aynı zamanda Balkanlar, AB tarafından çevrelenmiştir. Bulgaristan ve Romanya'nın üyeliği, Birliğin sınırlarını Güneydoğu Avrupa'ya kadar genişletmiştir. Bununla birlikte Sofya ve Bükreş'in üyeliklerine rağmen, AB tarafından Schengen sınırlarının dışında bırakılmak suretiyle emek piyasasından da 2014'e kadar mahrum bırakılmışlardır. Bu politikayla AB, bölgedeki varlığını güçlendirirken, adaylık statüsünde olan veya müzakere yürüten ülkelere siyasi birliğin aslında bir başlangıç olduğunu tam üyelik koşullarının ise o kadar da kolay oluşmadığı mesajını vermek istemektedir.

Makedonya'yı Bulgaristan ve Türkiye ile karşılaştırma nedenlerimiz; ülke etnisite olarak Bulgaristan'a benzerken, göç sorunu açısından Türkiye gibi transit bir ülke olması ve yurtdışında yüksek miktarda vatandaşının yaşamasıdır. Özellikle Bulgaristan'ın AB'ye üye olmadan önceki kişi başına geliri Makedonya'dan daha azken üyelik süreci ve sonucunda artış göstermektedir. Tablo 2'de görüldüğü üzere Bulgaristan AB üyesi

olduktab sonra yoğun göç yaşamıştır. Makedonya bu anlamda daha üyelik alınmadan Schengen muafiyeti sonucunda son üç yılda 30 bini üzerinde AB üye ülkelere iltica için başvuruda bulunması Makedonya'da da benzer sürecin yaşanabileceğini göstermektedir. Makedonya'nın en önemli sorununun ekonomik olduğu kabul edildiğinde (ortalama ücret 330 Euro) üyeliğin Makedon ekonomisine etkisi yasadışı göç sorunsalını azaltacaktır. Çünkü 2009 yılından sonra The Economist'e göre Balkan ülkelerinin Schengen alanına dahil edilmesiyle Makedonya'dan 3 yıl içinde Lüksemburg, Belçika, Almanya, Hollanda ve İsviçre'ye 30 bin, toplam 5 balkan ülkesinden Avrupa'ya 80 bin civarında iltica şeklinde göç gerçekleşmiştir. Özellikle Almanya'ya 2012 yılında 6 bin Makedon'un başvurusu bulunmaktadır. Bunda en önemli etken olarak; Makedonya'daki ortalama maaşın düşüklüğü olarak kabul edilmektedir. Ancak yüksek oranlardaki ilticanın sistemi zora sokabileceği ve vize kolaylığının kaldırılabileceği tartışılmaktadır (The Economist 2014). Almanya'nın tercih etmelesinin bir nedeni de Makedonya'daki bir yıllık asgari ücretin dokuz katı asgari ücret kazanılmasıdır. Frontex'e göre beş balkan ülkesiyle (Arnavutluk, Bosna-Hersek, Kosova, Makedonya, Sırbistan) yapılan vize kolaylığından sonra iltica başvurularının yüzde 20'si Makedon vatandaşları tarafından gerçekleştirilmiştir (Frontex 2013, 27). AB yaşadığı sorunun benzerini daha fazla nüfusa sahip Türkiye ile yaşayabilme korkusundan dolayı uzun yıllardır Türk vatandaşlarına vize kolaylığı sağlamamaktadır.

Makedonya'nın uluslararası sorunları; Yunanistan ile ülke ismi ve bayrağı, Sırbistan ile Makedon Ortodoks kilisesinin 1967 yılından bağımsızlığından dolayı dini, Bulgaristan ile ise dilsel ve etniksel çatışmalarıdır. Ulusal sorunlar ise, 1999 yılında yaşanan Kosova Savaşı sonrasında yarım milyona yakın Arnavutun Makedonya'ya göç etmesi sonucunda toplumun etnik yapısının karışması, ülkede çalışabilecek bireylerin üçte birinin işsiz olması ve çok etnikli yapının yaşadığı toplumda Anayasal sorun yüzünden çıkan iç çatışmadır. 13 Ağustos 2001 yılında Avrupa Birliği'nin önderliğinde Ohri Antlaşmasıyla iç çatışma sorunu çözülerek, en fazla oranda yaşayan (yüzde 25) Arnavutlara bazı haklar tanınmıştır. Diğer azınlıklar bu antlaşmada dikkate alınmamıştır. Makedonya'da 2002 nüfus sayımına göre; Toplumun yüzde 64,2'sini Makedonlar, yüzde 25,2'sini Arnavutlar, yüzde 3,9'nu Türkler, yüzde 2,7'sini Romanlar, yüzde 1,8'sini Sırplar ve yüzde 2,2'sini diğerleri (Boşnak, Ulah v.d.) oluşturmaktadır. Bunlara ilaveten ülkede Makedon haricindeki etnik yapının gelirinin düşük olması ülkedeki başka bir çatışma unsurudur. AB üyeliği Makedonya'nın bu sorunlarının çözümü için gerekli olan politik ve ekonomik reformlar için katalizör görevini sürdürmektedir. Bulgaristan, Makedonya ile arasındaki sorunları Müzakere Tarihi için sorun etmese de, Yunanistan ülke isminden dolayı 2009 yılından beri fasılların açılmasını engellemektedir.

| Ülkeler | Nüfus (milyon kişi) | | Milli Gelir (Milyar $) | | Kişi Başı ( $) | | Kişi Başına Gelir (SAGP $) | |
|---|---|---|---|---|---|---|---|---|
| | **1999** | **2013** | **1999** | **2013** | **1999** | **2013** | **1999** | **2013** |
| Türkiye | 62,2 | 81,6 | 249 | 821 | 4012 | 10061 | 8200 | 15300 |
| Bulgaristan | 8,2 | 6,9 | 13,2 | 53,7 | 1611 | 7782 | 5590 | 14400 |
| Makedonya | 2 | 2,1 | 2,5 | 10,65 | 1805 | 5071 | 5360 | 10800 |

*Tablo 2. Ülkelerin Üyelik Öncesi ve 2012 Ekonomilerinin Karşılaştırması* **Kaynak** *Konrad Adenauer Vakfı, (2001) ve CIA Factbook Macedonia, Bulgaria, Turkey verileri kullanılarak düzenlenmiştir.*

Makedonya'nın sosyo-ekonomik sorunlarına bakılırsa; 2011 verilerin göre halkının yüzde 30,4'ü fakirlik sınırı altında yaşarken yüzde 27,1 ise fakirlik riski altında yaşamaktadır. Özellikle Makedon İstatistik Kurumu tarafından yapılan çalışmalara göre; halkın sosyal transfer ve emeklilik maaşı almadığı durumda fakirlik riski altındaki nüfus yüzdesi yüzde 47,1'e çıkmaktadır. Ayrıca fakirliğin en önemli nedenlerinden birisi işsizlik olgusudur. 15-24 yaş arasında işsizlik yüzde 55 iken, 15-74 yaş aralığında bu oran yüzde 32 olarak gerçekleşmektedir. Ülke nüfusunun 2,1 milyon kişi ve çalışabilir nüfusun 965 bin kişi olduğu düşünüldüğünde, toplumun en önemli sorunun istihdam olduğu aşikârdır. Ayrıca toplum arasında gelir dağılımında, gelirin yarısını toplumun en üst yüzde 20'lik dilimi elde etmesi ve nüfusun yarısına yakınının kırsalda yaşaması ekonomik sorunların temelini oluşturmaktadır (RMSSO 2014). Bunlara ilaveten ülkede yetersiz sermaye birikimi, girişimci sınıfın yoksunluğu ve üretim teknolojisinin eskiliği ekonomik sorunların çözülmesini ertelemektedir.

Soğuk Savaş'ın sona ermesinden sonra yeni bir dünya düzenine geçilmeye başlanmıştır. Bulgaristan, doğu-batı bloklaşması arasındaki konumunu net bir biçimde değiştirerek batı ile olan entegrasyonunu tamamlamıştır. Yeni ekonomi-politik düzen, demokrasi ve hukukun üstünlüğü alanlarında gelişim göstermeye devam etmektedir. Bugün ülke içindeki ırkçı veya aşırı milliyetçi söylemler eskiye oranla oldukça azalmış durumdadır. Azınlıklara sağlanan haklar ve Avrupa vatandaşlığı, ülke için önemli bir gelişim göstergesi olarak algılanmaktadır. Diğer taraftan AB açısından Bulgaristan, ekonomik bir ortaktan çok doğu-batı bloklaşmasında doğudan kazanılmış bir kale olarak güvenlik boyutunda değerlendirilmektedir. Bu durum göç ve serbest dolaşım konularında Bulgaristan üzerinde bir baskı oluştursa da, Ocak 2014 tarihinden itibaren Bulgaristan'ın serbest dolaşım hakkı gerçekleşmiştir.

AB'nin, Türkiye'nin üyelik süreci ve Bulgaristan'ın üyeliğinden sonra başlayan fiziki sınır komşuluğu ile bölgedeki varlığı, daha fazla genişlemek için (AB açısından) ekstra momentum yaratmaktadır. Ayrıca birliği güvenlik ve yasadışı geçişler anlamında Türkiye'ye biraz daha yaklaştırmaktadır. Bu yakınlaşma AB tarafından uçlardaki eski üyelere (Bulgaristan, Romanya) birtakım sorumluluklar yüklemektedir. Bunlardan en önemlisi AB

sınırlarının güvenliği konusudur. Bu sebeple, göç kavramı içerisinde incelenen kitlesel nüfus hareketlerinin özellikle yasadışı boyutunun önümüzdeki birkaç on yıl daha AB politikalarının şekillenmesinde etkili olacağı öngörülmektedir. Türkiye, tam üyelik durumunda yukarıda bahsedilen görevi üstlenmeye vize kolaylığı karşılığında hazırlıklı olacağını beyan etmektedir. Bununla birlikte özellikle Türkiye gibi doğudan batıya göçün güzergâhında bulunan bir ülkenin gerek doğal afetler gerekse savaşlar, çatışmalar, siyasi ve ekonomik temelli olumsuzluklar neticesinde yeni göç hareketleriyle karşı karşıya kalma olasılığı yüksektir. Bu sebeple ulusal ve uluslararası planlama ve stratejiler geliştirilmesi, mevcut yasal altyapıyla birlikte daha dinamik ve etkili önleyici tedbirler oluşturması gerekmektedir.

2011 yılında Makedonya tarafından yasadışı göçlere yardım eden veya vize kolaylığını istismar edenlere 4 yıl ceza verilmesi hakkındaki kanun çıkarılmıştır. Buna ilaveten AB'nin Makedon yetkililerle sınır gözetleme işbirliği sonucunda da; 2012 yılında Makedonya'dan Bulgaristan'a yasadışı geçişlerdeki yakalanma bir önceki yıla göre yüzde 1 azalarak 10 kişi olurken, diğer balkan ülkelerinden Sırbistan'a yasadışı geçiş yakalanma düzeyi yüzde 20 artarak 8.471 olarak gerçekleşmiştir. Ayrıca Yunanistan'dan Makedonya'ya yasadışı geçişler yüzde 1 azalırken yakalanan kişi sayısı 536 olmuştur. Arnavutluk'tan Makedonya'ya geçişler ise 2011 yılına göre yüzde 32 artarak 253 kişi yakalanmıştır. Makedon hükümeti ve AB Makedonya'yı transit ülke kabul ettiğinden daha çok Asya'dan (Afganistan, Pakistan, Cezayir, Suriye kökenliler) Türkiye ve Yunanistan üzerinden gelen yasadışı göçe engel olmayı düşünmektedir. Yasadışı göç olayında Frontex'in verilerine göre transit ana ülke Türkiye'den Yunanistan'a 2012 yılında kara yolundan kaçak göçmen sayısı geçişi yüzde 44 azalmasına rağmen 30 bin olurken, kaçak göçmenler deniz yoluyla geçişleri artırmış ayrıca Bulgaristan üzerinden geçişlere yönelmişlerdir. (Frontex 2013,19)

Makedonya AB için bir transit ülke konumunda olsa da; Ülke AB'yi ekonomik unsur olarak görürken, AB ise ülkeye güvenlik açısından yaklaşmaktadır. Makedonya'da göç olgusu çok eskilere dayanmaktadır. 1945-1994 döneminde 475-495 bin civarında ülke dışına çeşitli nedenlerle göç gerçekleşmiş iken 1994-2013 döneminde bu sayı 50 bin civarındadır. Göç edenlerin etnik yapısı ise yüzde 62,6 Makedon, yüzde 29,6 Arnavut, yüzde 3,2 Türk ve yüzde 2,2 Roman topluluktandır. Ülkedeki nüfus dağılımına paralel dış göç oranı görülmektedir. Bu da ülkedeki genel sorunun etnik ayrım yapmadan her topluluğu etkilediğinin göstergesidir. Özellikle Arnavutların İsviçre ve İtalya'ya göçleri (140 bin civarında) dikkat çekicidir. (Agich 2013, 12-14). 2010 verilerine göre Makedonya dünyada nüfusunun dörtte birinden fazlasını göç vererek yüzdelik bazda en fazla göç veren ülke konumundadır. Göç edilen hedef ülke bazında AB ülkeleri ağırlıklı olsa da, Kanada, A.B.D. ve Avustralya gibi uzak ülkelere de göç oranı yüksektir. Göçmenlerden elde edilen gelir bakımından dünya sıralamasında 381 milyon dolar ( 260 milyon dolar işçi, 121 milyon dolar tazminat) ile dokuzuncu sıradadır. Buna karşılık ülke nüfusunun yüzde 1'i mülteci olsa da, geri göç anlamında Arnavutluk, Türkiye ve Bosna-Hersek'ten ülke nüfusunun yüzde 6'sına tekabül eden bir göçmende almaktadır. Özellikle eğitimli işgöçünün tespit edildiği doktor işgöçünde ülkedeki 2000 yılında doktorların yüzde 2'sinin (91 kişi) göç ettiği görülmektedir. Ayrıca ülkenin göç stoğu ülke nüfusunun yaklaşık dörtte birini oluşturması göçün yoğunluğunu göstermektedir (WB 2011, 167) Nüfusun azlığı ve kaliteli işgücünün kıtlığı düşünüldüğünde miktarsal anlamda ciddi rakamlara ulaşmaktadır. Ayrıca Makedonyalı kaliteli ve eğitimli işgücünün yüzde 29,1'i yurtdışına göç etmektedir. Bulgaristan'da ise doktorların % 2,9'u (814 kişi) dışarıya göç etmiştir. Bu rakam toplam eğitimlilerin yüzde 6,6'sının göç oranı içindedir (WB 2011, 81). Türkiye ile kıyaslandığında doktorların yüzde 3,2'ye (2742 kişi) tekabül etmektedir. Türkiye'nin kaliteli ve eğitimli işgücünün sadece yüzde 5,8'i yurtdışına göç etmektedir (WB 2011, 246). Kıyaslamalardan da anlaşılabileceği gibi, bir ülkenin kalkınmasını sağlayacak temel kaynağın kaliteli ve eğitimli işgücü olduğu düşünüldüğünde Makedonya gelişim için sürekli dezavantaj durumunda kalmaktadır. Ülkenin istihdam yaratamama sorununa ilaveten yetişmiş işgücünüde ülke içinde tutamamaktadır.

Makedonya'yı Türkiye'ye benzer yapan sadece transit ülke olması değil ayrıca yurt dışında yaşayan 2 milyon Makedonyalı'nın varlığıdır. Türkiye'nin yaklaşık 5 milyon Türk vatandaşı yurtdışında olması ülke nüfusuna göre az bir rakam iken, Makedonya'nın ülke nüfusuna oranı çok yüksektir. Makedon diasporası hem geniş yayılım hem de etkin ekonomik bağlarla dünyadaki güçlü diasporalardan birini oluşturmaktadır. Ancak bu diasporanın temel sorunu etnik farklılığın sorun teşkil etmesidir. Makedon Arnavutlar bu konuda farklılık göstermektedirler. Makedonya vatandaşlarının temel göç nedenleri; İşsizlik, ailevi, evlilik, eğitim ve etnik çatışmadır. Dönemlere göre farklılık gösterse de, yapılan çalışmalara göre göç nedenleri; toplumun yüzde 57'si çalışma amacıyla, yüzde 22'si ailevi nedenlerden, yüzde 7'si eğitim amacıyla, yüzde 3 evlilik amacıyla ve yüzde 11'i diğer amaçlarladır. Etnik açıdan hedef ülkelerde farklılık göstermektedir. Makedon kökenliler yüzde 20 İtalya, yüzde 12 İsveç, yüzde 8 A.B.D ve yüzde 49 diğer ülkeler iken; Arnavut kökenliler ise yüzde 30 İsviçre, yüzde 20 İtalya, yüzde 4 A.B.D ve yüzde 23 diğer ülkelerdir. (Mughal v.d. 2008) Özellikle belli ülkelerde yoğunlaşmaları diasporalarının güçlenmesine ve ailevi bağlarının diğer nesillere aktarımını sağlamaktadır.

## 6 Sonuç

Makedonya açısından; Eski Yugoslavya'nın dağılmasından sonraki dönemde meydana gelen çatışmalar, siyasi belirsizlik, yüksek orandaki işsizlik, Yunanistan ve Bulgaristan içindeki Makedonların maruz kaldığı etnik baskılar gibi nedenler denizaşırı coğrafyalardaki Makedon Diasporası'nın oluşturmuştur. Makedonlar,

bulundukları yerlerde kültürel, siyasi, sosyal ve dini faaliyetlerini sürdürmektedirler. Ayrıca Kanada, ABD ve Avusturalya'da sosyal ve siyasal lobi özellikleri göstermektedirler. Burada ele alınan diaspora örgütlerinin ve topluluklarının da bulundukları ülkelerde zaman zaman iç anlaşmazlıklar yaşadıklarını belirtmekte yarar vardır. Makedonya açısından diasporanın varlığı, ticari ve manevi anlamda çok büyük bir yer tutmaktadır. Günümüzde "Küçük Balkanlar" da denilen Makedonya'da hâkim unsur Makedonlar olmasına rağmen, oldukça önemli sayıda Arnavut, Türk ve Roman azınlık görece liberal ve adaletli sayılabilecek bir anayasa kapsamında güven içerisinde yaşamaktadırlar. Özellikle AB üyeliği hedefi sebebiyle, azınlıklar ve insan hakları, ekonomi ve bölgesel istikrar konularında ülkede ciddi bir iyiye gidiş söz konusudur. Ancak son dönemde yaşanan kültürel ve ekonomik çatışma ülke içinde sorunları ortaya çıkarmaya başlamıştır. Özellikle Üsküp bölgesi Türkiye'de İstanbul'a benzer şekilde kümelenmekte ve etnik çatışmaların yaşanma ihtimalini artıran bir iç göç sorunu ile mücadele etmektedir.

Ülkenin sahip olduğu ekonomik sorunlar ve etnik farklılıkların çözümü olarak komşusu Bulgaristan gibi AB üyeliği hem muhalefet hem de iktidar tarafından öncelik olarak kabul edilmektedir. Özellikle Bulgaristan etnik çatışmaların çözümünde model ülke olarak ele alınmaktadır. Bulgaristan benzerliğinde ülkenin ekonomisinin gelişmesine rağmen yoğun dış göç yaşanarak, ülke nüfusunun azalmasıyla kişi başına gelirin artacağı kabul edilebilir.

Ancak Makedonya temel sıkıntısını ülke içinden değil komşusu Yunanistan ile yaşamaktadır. Hem AB için fasılların açılmasında hem de NATO'ya üyelikteki tek engelleri Yunanistan'ın vetosudur. 2011 yılından beri Yunanistan'da var olan ekonomik kriz dolayısıyla AB'nin önderliğinde iki ülke arasındaki kriz çözülebilir. Çünkü Yunanların eli çok zayıflamış durumdadır. Ancak Yunanistan hem AB üyeliği hem de NATO'ya üyelikteki kozunu bırakmak istememektedir. Makedonya AB'yi ekonomik unsur olarak görürken AB ise ülkeye göç yolları üzerinde bulunmasından dolayı güvenlik açısından yaklaşmaktadır.

# Türkiye'de Uluslararası Fonların Paradoksal Etkisi: Hollanda Hastalığı

# The Paradoxical Effect of International Funds in Turkey: Dutch Disease

Asst. Prof. Dr. Taner Akçacı (Kilis 7 Aralık University, Turkey)
Aydan Karaata (Kilis 7 Aralık University, Turkey

## Abstract

International funds flow freely across the countries both quantitatively and legally as a result of financial liberalization carried out by globalization process and huge amount of money flows into the countries in liberal system. Particularly for developing countries, these fund flows refer as hot money are mentioned frequently with respect of positive and negative signs. High export performance of the Netherlands as a result of discovering large natural gas reserve leads to increase rapidly its own currency. In 1959 when economic indicators getting worse, the reason of crisis appears as decreasing export in consequence of over-valued currency leads to decrease the industrial production. This paradoxical situation is named as "Dutch Disease" in economics literature. The purpose of this study is examining the effect of hot money inflow on the manufacturing sector of Turkey and testing Dutch disease for Turkish economy. In this paper, the monthly data 2006:01-2013:12 from Central Bank of the Republic of Turkey is used. Test results of causality tests that Toda-Yamamoto method (1995) and Hacker-Hatemi-J (2006) bootstrap method approve that there is no causality between portfolio investment and manufacturing industrial production index and also export. The results confirm that portfolio investments do not lead to Dutch disease for Turkey.

## 1   Giriş

Küreselleşmenin en önemli özelliklerinden birisi uluslararası fon akımlarının serbestleşmesidir. Bu serbestlik, hem miktar hem de yasal kısıtlamalar olmaması şeklinde belirlenmiştir. Bu sisteme dâhil olan ülkelere kısa vadeli ve sınırsız fon giriş çıkışı söz konusudur. Kısa vadeli bu fon akışları genel olarak "sıcak para" olarak adlandırılmaktadır. 1980'li yıllardan itibaren ikiz açık veren ülkeler, yani hem bütçe hem de ödemeler dengesi açığı olan ülkeler, bu açıkları kısa vadeli fonlar yardımıyla finanse etmektedirler. Sıcak para girişi sonucunda değerli hale gelen ülke parası ise, ülke sanayisinin rekabet gücünün giderek azalmasına neden olmaktadır. Bütçe ve ödemeler dengesi açığı için bulunan kısa vadeli çözümler uzun vadede ülke ekonomisi üzerinde yıkıcı etkiler yaratmaktadır (Tarhan, 2012). Bu durum, sıcak para girişlerinin literatürde Hollanda hastalığı olarak bilinen olgu ile aynı sonuçlar doğurup doğurmayacağının sorgulanmasını gündeme getirmektedir.

Hollanda hastalığı kavramı ilk olarak, 1960'larda Hollanda'nın Kuzey Denizinde büyük doğalgaz kaynakları keşfetmesi sonrasında, rekabetin olumsuz etkilenmesi durumun ifade etmek için kullanılmıştır. Doğalgaz kaynaklarının keşfedilmesi sonrasında Hollanda'nın ulusal parası değer kazanmış ve petrol haricinde ihracatı, rekabet edilebilirliğini yitirmesinden dolayı zarar görmüştür. Böylece kamu sektörü gelişirken, ikincil sektörün karlılığı azalmış ve üretim kaynakları hizmet sektörüne yönelmiştir. Bütün bunlar ise, sanayileşmede gerilemeye neden olmuştur (Adenauer ve Vagassky, 1998:177). Hollanda hastalığının teorik temellerini açıklayan ekonomistler Max Corden ve Peter Neary, bu hastalığın sonuçlarını "de-endüstrilizasyon" ve "de-agrikolinazosyon", yani ülkenin sanayi ve tarımsal üretimini yitirmesi olarak tanımlamışlardır (Soysal, 2010). Teorik çerçeve açısından Hollanda hastalığına bakıldığında, daha çok sanayisizleştirme (de-industrialisation) olgusunun öne çıktığı anlaşılmaktadır. Kazanç patlaması yaşayan sektörde artan verimliliğin ve üretimin, diğer ticarete konu olan ve ticarete konu olmayan sektörlerde üretim azalışına neden olması durumuna kaynak dağılım etkisi adı verilmektedir. Bu etki sonucunda sanayi üretiminin gerilemesi ise doğrudan sanayisizleştirme (direct de-industrialisation) olarak adlandırılmıştır. Kaynak dağılım etkisi sonucunda, üretim miktarı azalacak olan ticarete konu olmayan sektörlere yönelik talep fazlalığının fiyatları artıracağı ve reel döviz kuru değerlenmesi sonucunda, dünya fiyatlarını kabullenici durumda olan sanayi sektörü üretiminin, rekabet edebilirliği düşecek ve bu da dolaylı sanayisizleştirmeye (indirect de-industrialisation) sebep olacaktır (Gurbanov, 2012:10). Türkiye 1980 ortalarından itibaren, kendi kaynakları ile finanse edemeyeceği bir harcama ve tüketme eğilimi ile artan bir mali bozulma sürecine girmiştir. Bütçe açıklarını kapatmak yerine nasıl finanse edileceği üzerine yönelen hükümetler döneminde ise ekonominin rekabet gücü azalmış, döviz kazanma potansiyeli düşmüş, sıcak paraya bağımlılığı giderek artmıştır.

Sıcak para hareketleri, giriş yaptığı ülkelerde yatırıma olan ilgiyi azaltarak reel ekonomiden bağımsız bir şekilde makroekonomi politikalarını kullanılmaz hale getirmekte ve bu durum Merkez Bankası'nın yüksek miktarlarda rezerv tutmak zorunda kalmasına ve Merkez Bankası'nın bağımsız politikasını sınırlamasına neden olmaktadır. Sıcak para diğer taraftan, dış borç stokunun kabarmasına ve bütçedeki faiz yükünün ağırlaşmasına

neden olarak, Merkez Bankası'nın ekonomik politikalarının etkinliğini azaltmaktadır. Dolayısıyla, sıcak para spekülasyonun önlenmesi, bunun için de kamu borçlanma gereğinin azaltılması zorunluluk arz etmektedir (Kara, 2001:6-9). Uluslararası finans piyasalarında en yüksek getiriyi elde etme arzusunda olan yurt dışı kökenli kısa vadeli finansal sermaye (sıcak para) hareketleri, özü itibariyle mali piyasalarda kırılganlıklar yaratan unsurlar içermektedir ve zaman içinde ulusal ekonomide yeni risklerin doğmasına yapısal zemin hazırlamaktadır. Söz konusu kırılganlıkların en önemli göstergelerini ise, artan dış ticaret ve cari işlemler açıkları ile kısa vadeli dış borçların merkez bankası döviz rezervleri karşısındaki yükselen oranları oluşturmaktadır (Yeldan, 2005:1). Bunun dışında sıcak para ulusal paranın değerlenmesine neden olarak ihracatta azalma ve buna bağlı olarak da cari açığın artmasına neden olmaktadır. Yoğun sıcak para girişlerinin reel döviz kurunu düşürmesinin de etkisiyle özel sektörün dış borca yönelmesi bir yandan ülkenin dış borcunu artırırken diğer yandan da aşırı bir kur riski meydana getirmektedir. Döviz kurunun yükselmesini önlemek amacıyla piyasaya yapılan müdahaleler ise TL dengesizliğine yol açarak para politikasının istikrarsızlığına neden olmaktadır.

Zaman içerisinde faiz ile kur arasındaki marjın giderek açılması, ülkeye yönelik sıcak para akımlarının daha çok, faiz ve kur beklentilerine göre hareket eden, duyarlık derecesi yüksek, spekülatif amaçlara yönelik sıcak para niteliği taşımasına yol açmaktadır. Genellikle de gelen bu kaynaklar ilk siyasi krizde ülkeyi terk etmektedirler. Bunun sonucunda da, ülkeden çıkan sermaye, finansman sorununun yeniden gündeme gelmesine ve var olan makroekonomik istikrarsızlığın daha da derinleşmesine neden olmaktadır. Bunların dışında sabit sermaye yatırımlarının düşmesi de, sıcak para girişinin bir başka olumsuz etkisidir. Sıcak para akımlarının hızlanması ile reel faiz oranlarının artması, zaman içinde sabit yatırımların maliyetini artırıp, gelen sermayenin uzun dönemli yatırımlara yönelmesini engellemektedir. Bu durumda kaynaklar, reel yatırımlar yerine kamunun iç borçlanma senetlerine yönelmektedir. Reel faizlerin yükselmesi, bir yandan kaynakları spekülatif finansal yatırımlara yönelmesine yol açarken, diğer yandan sermaye maliyetini yükseltmektedir. Bu sonuç, reel kesimin ekonomideki payını küçültürken, rantiye kesiminin payını büyütmektedir (Kara, 2001:8). Türkiye'de son yıllarda, sermaye girişlerinin yurtiçi tasarrufları engellediği ve potansiyel olarak, enflasyonist baskı yarattığı, döviz kurlarının dengesini bozarak makroekonomik istikrarsızlıklara neden olduğu da bilinmektedir. Bazı çalışmalarda, yabancı sermaye girişlerinin ekonomik ilerlemeyi engelleyebileceği ifade edilmektedir (Ertuna, 2007:5). Bu durum Türkiye'de Hollanda hastalığının belirtilerine benzer iktisadi problemlere rastlanıldığını göstermektedir.

Bu çalışmanın amacı, portföy yatırımlarının Hollanda hastalığına neden olup olmadığını Türkiye ekonomisi için test etmektir. Çalışmada öncelikle Hollanda hastalığı teorik olarak açıklanmakta ve daha sonra konu ile ilgili yerli ve yabancı literatüre yer verilmektedir. Çalışma ampirik analiz ve analiz sonuçlarının değerlendirilmesi ile sonlandırılmıştır.

## 2 Hollanda Hastalığı

Hollanda hastalığı terimi ilk kez 1977 yılında "The Economist" dergisinde kullanılmıştır. Bu terim, ticarete konu olan mallar üreten sektör içerisinde genişleyen ve daralan iki alt sektörün eş anlı olarak ekonomide var olması durumunu açıklamaktadır (Corden, Neary, 1982:825). Hollanda hastalığı etkisi, teorik olarak, "Salter-Swan-Corden-Dornbusch" modeline dayanarak açıklanmaktadır. Bu bağlamda ilk olarak, ticari ve ticari olmayan mal gruplarının var olduğu ve her iki mal grubunun da kendi arasında ikame edilemediği varsayılmaktadır. Ticari mallar, ihracat ve ithalatta kullanılan dolayısıyla uluslararası piyasalarda alınıp-satılan mallardır. Bu sebeple, ticari malların fiyatları uluslararası piyasalarda belirlenmektedir. Ticari olmayan malların fiyatları ise, ulusal piyasalarda belirlenmektedir (Acosta, vd, 2009:104; Adenauer ve Vagassky, 1998:177). Diğer bir açıdan sınıflandırıldığında ise üç sektör ön plana çıkmaktadır. Bunlar; doğal kaynaklara dayalı sektörler (madencilik, doğalgaz, petrol vb.), ticarete konu olan sektörler (uluslararası ticarete konu olabilecek mal ve hizmet çıktıları olan tarım ve imalat sanayi) ve ticarete konu olmayan sektörler (sağlık, eğitim, perakende, inşaat vb. içeren hizmetler sektörü)'dir. Bu üç sektörden ikisinin (doğal kaynaklara dayalı ve ticarete konu olan sektörler) fiyatları uluslararası piyasada belirlenirken, ticarete konu olmayan sektörler ulusal piyasada fiyatlanmaktadır (Bacak, 2014:2).

Hollanda Hastalığı ile genelde karşılaşılan durumlarda kazanç patlaması yaşayan sektör, doğal kaynak keşfedilen sektör iken, üretimi daralan sektör ise sanayi veya tarım olmaktadır. Hollanda hastalığı artan doğal kaynak ürünleri ihracatından dolayı ülkeye yabancı döviz gelirlerinin akması dolayısıyla, reel döviz kurunun değerlenmesiyle sonuçlanmaktadır. Bu da ekonomik kaynakların sektörel olarak yeniden dağılımını gerektirmektedir. Sermaye ve emek, tarım ve sanayi gibi sektörlerden ayrılarak doğal kaynak keşfi yaşanan sektöre kaymaktadır. Ticarete konu olmayan sektörün de fiyatı artmaktadır. Nihai sonuç ürettikleri mallar için rekabetçi uluslararası fiyatlarla karşı karşıya olan, ticarete konu olan tarım ve sanayi sektörlerinde artan maliyetlerin ve azalan rekabet edebilirliğin ortaya çıkması şeklinde kendini göstermektedir. Doğal kaynak gelirlerindeki kazanç patlaması, ekonominin diğer önemli sektörlerine dışlama etkisi düzeyinde etki ederek o sektörlerin üretimini daraltmakta ve onların rekabet gücünü kaybetmesine neden olmaktadır.

Zengin doğal kaynaklara sahip ülkelerin performansının, doğal kaynakları daha az olan ülkelere oranla düşük olması, ekonomi literatüründe "kaynakların laneti" olarak adlandırılmaktadır. Kaynak açısından fakir ülkelerin, kaynak zengini ülkelerden daha yüksek performans sergilemesi, ekonomi tarihinde sıkça görülmektedir. (Yürük, 2008:1). Uzun dönemde ticaret hadlerinin bozulması, doğal kaynak gelirlerindeki volatilite, rant paylaşımı konusunda çatışma, aşırı borçlanma, dışlama etkileri, kamu sektörünün artan rolü, sosyo-kültürel ve politik etkiler gibi durumlar kaynakların laneti olgusunun alt başlıklarını oluşturmaktadır (Gurbanov, 2012:128). Ancak doğal kaynak zengini ülkelerin ekonomik faaliyetlerinde meydana gelen tüm bozulmaları, Hollanda Hastalığı modeliyle açıklamak mümkün değildir.

Hollanda Hastalığı, sadece doğal kaynak zengini ülkeleri ilgilendirmemektedir. Çeşitli nedenlerle doğal kaynak zengini olmayan ülkeler de Hollanda hastalığı ile mücadele etmek zorunda kalabilmektedir. Literatürü incelediğimizde İspanya'nın turizm gelirlerinin, bölgesel düzeyde bile olsa sanayisizleştirme yönünden sonuçlar doğurması, Kolombiya'daki kahve gelirlerinin diğer tarımsal ürünler üzerinde etkisi, Ürdün, Mısır ve Türkiye'de işçi gelirlerinin Hollanda hastalığı belirtilerine benzer şekilde, sanayisizleştirme yönünde yapısal değişimler doğurduğu sonuçlarına ulaşılmıştır (Gurbanov, 2012:143).

## 3   Literatür Taraması

Hollanda hastalığına ilişkin yerli ve yabancı literatürde bulunan çalışmalar tarih sırasına göre şu şekilde sıralanabilir:

Buiter ve Purvis (1983) Amerika'da petrol fiyatlarının mal ve varlık piyasalarında uyumunun farklı hızlarını içeren bir model kullanılarak gerçekleştirdikleri çalışmalarında kur değişimlerinin yerli talebe etkisinin yavaş olacağı ve petrol fiyatlarındaki artışın uzun dönemde talep düşününe yol açacağını ve bu durumun Hollanda hastalığı olarak değerlendirilebileceği sonucuna ulaşmışlardır.

Edwards, (1983) petrol gibi belirli bir ihracat sektöründe yaşanan ani bir artışın ekonominin diğer sektör rekabetine etkisini incelediği çalışmasında Hollanda hastalığının tam bir ekonomik hastalık olarak değerlendirilemeyeceğini ifade etmektedir. Edwards'a göre ekonomide petrol fiyatındaki kalıcı bir artış, petrol dışı dış ticarete konu olan sektörlerin fiyatlarında bir azalmaya neden olacaktır.

Kamas'ın (1986) Kolombiya'daki kahve ve uyuşturucu ihracatını Hollanda hastalığı açısından test ettiği çalışmasında, kahve ve yasadışı uyuşturucu ihracatından dolayı döviz gelirlerinde meydana gelen artışların, ülkede sanayisizleşme sonucunu doğurduğu tespit edilmiştir. Çalışma ayrıca Kolombiya ekonomisinde, reel döviz kurunun kahve fiyatına duyarlı olduğunu göstermiştir.

Benjamin, (1989) Hollanda hastalığını Kamerun ekonomisi için test etmiştir. Kamerun petrol rezervlerinin tarım sektörüne zarar verdiği ve devlet müdahalesi ile durumun düzeltilmesi gerektiğini savunmuştur. 1973 sonrası dönemde petrol ihraç eden ülkelerin tarım ve sanayi sektörleri için de durumu genellemiştir.

Fardmanesh, (1991) 1966-1986 dönemi için beş gelişmekte olan ve petrol ihraç eden ülkenin (Cezayir, Ekvator, Endonezya, Nijerya ve Venezuela), petrol ihracatında meydana gelen artışın tarım ve imalat sektörlerine etkilerini incelemiştir. Petrol gelirlerinde meydana gelen artışların tarım ve sanayi sektörünü olumsuz etkilediğini bunun yanında petrol gelirlerinde bir düşüş olması durumunda ise petrol çöküşünün yaşanabileceği ifade edilmiştir.

Looney, (1991) Kuveyt sanayisinin gelişimini incelediği çalışmasında, reel döviz kuru ve sektörel enflasyon nispi oranlarındaki hareketlerin ekonomide Hollanda hastalığı etkisi doğurduğunu ve 1982 yılında meydana gelen petrol fiyat düşüşlerinin Hollanda hastalığının etkilerini güçlü şekilde gösterdiğini ifade etmiştir.

Feltenstein, (1992) çalışmasında, tarımsal göç ve ihracatı etkileyen politikaları değerlendirmiş, 1986-1987 döneminde Meksika'da tarım dışına göç nedeniyle reel döviz kuru değişikliklerinin yanı sıra fiyat değişikliklerinin sonucunu Hollanda hastalığıyla bağdaştırmıştır.

Paldam, (1997) Danimarka'ya yapılan büyük hibe sayesinde ülke ekonomisindeki toparlanmanın, bir süre sonra yerini Hollanda hastalığının sonuçlarına bıraktığını tespit etmiştir. Çalışmaya göre, 1950'li yıllara kadar yardımlarla orta gelir seviyesine ulaşan ülkenin 1960'lı yıllarda büyümesi durmuştur.

Vos, (1998) 1980 sonrasında Pakistan'a yapılan hibe formundaki yardımların güçlü Hollanda hastalığı etkileri doğurduğunu, yardımların ülke ekonomisinin büyümesine uzun dönemde olumsuz etki yaptığını tespit etmiştir.

Kara, (2001) döviz kurunun düşük belirlendiği ülkelerde, sıcak para denilen kısa vadeli sermaye hareketlerinin teşvik edilmesinin olumsuz makroekonomik sonuçlarını incelediği çalışmasında, sıcak paranın, pahalıya borçlanma, reel kesimde küçülme, ekonomik ve politik araçların etkisizleşmesi ve ekonomik krizlere kaynaklık etmesi gibi olumsuzluklar başta olmak üzere birçok olumsuzluğa yol açtığını ifade etmiştir.

Kutan ve Wyzan, (2005), Kazakistan ekonomisinde Hollanda hastalığını 1996-2003 dönemi için incelemişlerdir. Çalışmada bağımsızlığını kazanmasından bu yana, ihracatının enerji ile ilgili sektörler lehine değiştiği Kazakistan ekonomisinde reel döviz kurunun etkilenmesi sonucunda Hollanda hastalığını kanıtlayan bulgulara ulaşılmıştır.

Matsen ve Torvik, (2005) kaynak zenginliğini, ülke ekonomisinin büyümesini azaltan bir faktör olarak açıklamıştır. Diğer yandan çalışmada, kaynak zenginliğinin ekonomik büyümeye etkisine, optimum harcama yolu ile müdahale edilebileceği belirtilmiştir.

Drelichman, (2005) kolonilerinde büyük gümüş rezervlerinin keşfi ile İspanya'da Hollanda hastalığının geçerliliğini ispat etmiştir.

Yiğit, (2005) çalışmasında Türkiye'ye Almanya'dan akan işçi gelirlerindeki dalgalanmalar ile Almanya ve Türkiye ekonomilerindeki dalgalanmalar arasındaki ilişkiyi ekonometrik açıdan incelemiştir. Çalışmanın sonucunda Türkiye işçi gelirleri çevriminin, Türkiye iş çevrimleri ile aynı yönde hareket ettiğini ve Türkiye iş çevrimlerinin bu ilişkide öncü değişken olduğu kabul edilmiştir. Diğer taraftan, işçi gelirleri çevriminin Almanya ekonomisine duyarlı olmadığı görülmüştür. Bu sonuçlar ışığında Türkiye gelen işçi dövizlerinin ağırlıklı olarak yatırım amaçlı olduğu sonucuna varılmıştır.

İnandım, (2005) çalışmasında kısa vadeli sermaye hareketleri ile reel döviz kurları arasındaki etkileşimi, ilk olarak küresel seviyede ele almış, daha sonra ise Türkiye örneği kullanılarak, ekonometrik olarak analiz etmiştir. Ekonometrik analiz üç aşamadan oluşmaktadır. Birinci aşama reel döviz kurlarının Kalman ve HP filtreleme yöntemleri ile ayrıştırılması, ikinci aşama Granger nedensellik testi, üçüncü aşama ise regresyon analizidir. Ekonometrik analiz, kurların serbest dalgalanmaya bırakılmasından önceki 1995 - 2001 dönemi, kurların serbest dalgalanmaya bırakıldığı 2001 - 2005 dönemi ve her iki dönemi de kapsayan 1995 - 2005 dönemi olmak üzere üç ayrı dönem baz alınarak gerçekleştirilmiştir. Kısa vadeli sermaye hareketlerinin Türk lirasının değerlenmesi üzerindeki etkisine ilişkin sonuçlar dönemler ve kullanılan filtreleme yöntemine bağlı olarak değişmekte ve bu etki net olarak ortaya konulamamaktadır.

Egert, (2005) Güney Doğu Avrupa, Rusya, Ukrayna ve Türkiye'de denge kurları ülkelere özgü faktörleri de dikkate alarak incelediği çalışmasında, Rusya'nın denge döviz kurlarında görülen hareketlerin güçlü Hollanda hastalığı etkileri gösterdiği sonucuna ulaşmıştır.

Hjort, (2006) gelişmekte olan ülkelerde vatandaş fonlarının Hollanda hastalığına sebep olup olmadığını araştırdığı çalışmasında, gelişmekte olan ülkelerin başarıyla tür fonları işletmek için yeterli kurumsal kapasiteye sahip olup olmadığı sorgulanmıştır. Elde edilen bulgular, vatandaş fon yönetiminin, Hollanda hastalığı üzerinde önemli bir etkisinin olmadığını ve bu fonların makroekonomik etkilerinin belirsiz olduğunu göstermektedir.

Örnek, (2006) çalışmasında, Türkiye'nin 1996:4-2006:l üçer aylık dönemlerine ait, yabancı sermaye girişleri ve yurtiçi tasarrufları ile ilgili zaman serileri kullanılarak, iki değişken arasındaki nedensellik ilişkileri incelenmiştir. Yapılan ekonometrik analizler sonucu, doğrudan yatırımların kısa ve uzun dönemde yurtiçi tasarruflar üzerinde pozitif etki yarattığı; kısa vadeli sermaye akımlarının ise, kısa ve uzun vadede, yurtiçi tasarruflar üzerinde negatif bir etki oluşturduğu bulgularına ulaşılmıştır. Aynı zamanda, kısa vadeli sermaye girişleri ile doğrudan yatırımların ekonomik büyüme üzerinde pozitif etki yarattığını tespit etmiştir.

Bourdet ve Falck, (2006) çalışmalarında göçmen dövizlerinin reel kuru etkileyerek ekonominin rekabet gücü üzerinde yarattığı olumsuz etkinin Hollanda hastalığı ile sonuçlandığını bulmuşlardır.

Nowak, Sahli ve Mondher, (2007) turizm gelirlerindeki artışın ekonomiye etkileri incelemişlerdir. Ülkede turizm patlamasının yaşandığı dönem kıyı arazisinde turizm ürünlerine duyulan ihtiyacı artırmış, ülkedeki fon ve kaynaklar kıyı bölgelerine aktarılmış ve turizmden ciddi kazançlar elde edilmiştir. Ancak artan turizm gelirleri, kaynakları kısıtladığı için zaman içinde net refah kayıplarına neden olmuştur.

Acosto, Lartey ve Mandelman (2009) çalışmalarında reel döviz kuru gelirlerinin Hollanda hastalığı sonucu doğurması durumunu incelemişlerdir. Reel döviz kuru gelirlerinin, işgücü arzında bir düşüşe ve tüketim mallarının talebinde artışa yol açtığı sonucuna ulaşmışlardır.

Togay, (2009) çalışmasında, Kazakistan ekonomisinin iktisadi dinamiklerinin petrol sektörüne bağlı olarak şekillenmesine yol açan faktörlerin, dış kaynak kullanımındaki sorunlar ile reform çabalarındaki yetersizlik olduğu ortaya konmakta ve petrol sektörüne bağımlılığın azaltılması açısından, kısa dönemde, para politikasının rolünün ne olabileceği tartışılmaktadır. Kazakistan Merkez Bankasının Tenge'nin reel değerinin petrol fiyatlarına bağlı olarak istikrarsızlaşmasını önleyebilecek bir sisteme yönelmesi gerektiği vurgulanmaktadır.

Rajan ve Subramanian, (2011) bir ülkeye yapılan yardımların ülkenin rekabet gücü üzerinde sistematik olarak görülen olumsuz etkilerini araştırmışlardır. Araştırmada, ülkeye yapılan yardım girişlerinin etkisiyle reel döviz kurunda değerlenme olduğunu ve ülke sanayi ihracatını olumsuz etkilediğini ispatlayan kanıtlar bulmuşlardır.

Arı ve Özcan, (2011) çalışmalarında, işçi gelirlerinin ekonomik büyüme üzerindeki olası etkisinin yönünü sorgulamışlardır. Çalışmanın sonucunda, işçi dövizleri ve büyüme arasında pozitif bir ilişki tespit edilmiştir. Modelde yer alan ve büyümeyi belirleyen diğer değişkenler ise enflasyon oranı, kamu harcamaları ve dış borçlardır. Ticari açıklık oranının ise istatistiksel olarak anlamlı olmadığı gözlenmiştir.

Arı ve Özcan, (2012) işçi dövizlerinin Hollanda hastalığı problemine sebep olup olmadığını sorguladıkları çalışmalarında panel veri analizi ile Hollanda hastalığının varlığını doğrulayan kanıtlara ulaşılmıştır.

Beine, Bos ve Coulombe, (2012) Kanada'da ABD para birimi kullanılmasının Hollanda Hastalığı sonucu doğurup doğurmadığını incelemişlerdir. İncelemelerinde ilk olarak Kanada ve ABD para birimi bileşenleri üzerinde emtia fiyatlarının ayrı ayrı etkisini analiz etmişlerdir. Daha sonra Kanada'da imalatın istihdam hisseleri üzerinde iki para birimi bileşenlerinin ayrı ayrı etkilerini tahmin etmişlerdir. 2002 ve 2007 arasındaki kur değişimleri nedeniyle imalat istihdam kaybının %33 ile %39 arasında olmasının, Hollanda hastalığı olgusu ile ilgili olduğunu göstermektedir.

Egert, (2012) Orta ve Güney-Batı Asya'nın eski komünist devletlerinde Hollanda hastalığının görülüp görülmediğini emtia fiyatlarındaki değişimi inceleyerek test etmiştir. Çalışmada, ilk olarak, emtia fiyatlarının döviz kuru ile ilişkili olup olmadığını görmek için, nominal ve reel döviz kuru modelleri tahmini yapılmış ikinci olarak, emtia fiyatları ve doğal kaynakların ekonomik büyümeye etkisi analiz edilmiştir. Elde edilen sonuçlar, Hollanda hastalığı belirtileri ile uyumlu olup petrol ihracatının düşmesi durumunda büyümenin olumsuz etkileneceğine dikkat çekilmektedir.

Hasanov, (2013) 2000-2007 dönemi için Azerbaycan ekonomisinde Hollanda hastalığı hipotezini test ettiği çalışmasında petrol ihracatının ülkenin petrol dışı ticarete konu sektörün sanayisinde ciddi boyutlarda durgunluk saptanmış ve Hollanda hastalığının Azerbaycan ekonomisinde geçerli olduğu sonucuna ulaşılmıştır. Ayrıca, hızlı ücret artışları ve dış ticarete konu olmayan fiyatların reel döviz kurunun değerlenmesine yol açtığı saptanmıştır. Diğer yandan çalışmada, petrol sektörüne yapılan doğrudan yabancı yatırımların petrol dışı ihracatı olumsuz etkilediği ve petrol sektöründeki kaynak derinleşmesinin ülkenin petrole bağımlılığını artırdığı ifade edilmektedir.

Dülger, Lopçu, Burgaç ve Ballı, (2013) Rusya'da sanayileşmedeki durgunluğun Hollanda hastalığını olup olmadığını test ettikleri çalışmada, petrol fiyatlarındaki artışın, imalat çıktı payında bir azalma ve hizmet sektörü fiyatlarında artışlara sebep olduğu ve son yıllarda Rus ekonomisinin Hollanda hastalığının tipik belirtilerini sergilediği tespit edilmiştir.

Cherif, (2013) teknolojik anlamda az gelişmiş olan ülkelerin Hollanda hastalığına karşı daha savunmasız olduğu sonucuna ulaştığı çalışmasında, tekelci rekabet ve ölçeğe göre artan getiri ile ikili ticaret modelinde, doğal kaynakların ihracat gelirlerinde meydana gelen ani artışların ticarete konu olan sektörü olumsuz etkilediği ifade edilmiştir. Çalışmada, doğal kaynaklara bağlı olarak imalat sektöründe meydana gelen düşüşün önemli ölçüde ticaret ortağının teknolojik boşluğuna bağlı olduğu ifade edilmektedir.

Benkhodj, (2014) petrol ihraç eden ülkelerde görülen Hollanda hastalığını incelediği araştırmasında, petrol ihraç eden ekonomiye hem petrol fiyatındaki artış hem de petrol kaynağındaki artışı araştırmak için bir Multi-sektör Dinamik Stokastik Genel Denge modeli oluşturmayı amaçlamıştır. Araştırmanın sonucuna göre, iki temel mekanizma, yani harcama etkisi ve kaynak hareketi etkisi altında Hollanda hastalığı sadece esnek ücret ve döviz kuru sabitken yapışkan fiyat durumunda görülmektedir.

## 4    Ekonometrik Uygulama

### 4.1    Veri Seti

Çalışmada kullanılan, sanayi üretim endeksi (SANAYI), portföy yatırımları (PORTFOY) ve ihracat (IHRACAT) rakamlarını içeren seriler, TCMB Elektronik Veri Dağıtım Sistemi (EVDS)'den alınmıştır. Çalışmamızda 2006:01-2013:12 dönemi için aylık olarak elde edilen seriler öncelikle Census X12 yöntemi ile mevsimlik etkilerden arındırılmış, daha sonra birim kök testine tabi tutulmuştur. Değişkenler arasındaki nedensellik ilişkisi, Toda ve Yamamoto (1995) tarafından geliştirilen nedensellik analizi ve Hacker-Hatemi-J (2006) yöntemine dayalı bootstarp metodu ile test edilmiştir.

### 4.2    Birim Kök Testleri

Bu çalışmada serilerin durağanlıklarını analiz etmek için Augmented Dickey-Fuller (ADF) (1979) birim kök testi kullanılmıştır. Sıfır hipotezi altında birim kök olduğunu test eden ADF testi, AR sürecine dayanmaktadır. Ayrıca maksimum gecikme uzunluğu olarak Schwert (1989) tarafından önerilmiş olan formül kullanılır. ADF regresyonu aşağıdaki gibi yazılabilir.

$$\Delta y_t = \alpha_0 + \rho\, y_{t-1} + \sum_{i=1}^{k} \beta_i \Delta y_{t-i} + \varepsilon_t \qquad\qquad (1)$$

Eşitlik (1)'de $\rho$ uygun gecikme uzunluğunu gösterir. $\rho$'nin sıfır olması durumunda seride birim kök olduğunu ifade eden sıfır hipotezi reddedilememektedir.

Phillip ve Peron (1988) birim kök testi, ADF süreci içerisine kukla değişkenlerin ilave edilmesine dayanmaktadır. Dickey-Fuller testinde otokorelasyon sorununu ortadan kaldırmak için bağımlı değişkenin gecikme uzunlukları modele eklenirken bu durum serbestlik derecesinin düşmesine neden olmaktadır. Phillips-Perron birim kök testinde ise ilave gecikme ekleme yerine t testine parametrik olmayan bir düzeltme

yapılmaktadır. Bu sayede serbestlik derecesi kaybı olmamaktadır. Bunun için ADF regresyonuna sabit zaman etkisi eklenir.

$$\Delta y_t = \alpha_0 + \rho y_{t-1} + \alpha_2 t + \sum_{i=1}^{k} \beta_i \Delta y_{t-i} + \varepsilon_t \tag{2}$$

Eşitlik (2)'de y test bağımlı değişkeni, t zaman trendini gösterir. Dolayısıyla Eşitlik (I)'de zaman etkisi yokken Eşitlik (2)'de zaman etkisi vardır. Eşitliklerdeki i ise Schwarz bilgi kriterine göre seçilen gecikme uzunluğunu göstermektedir.

Elliot, Rothenberg ve Stock (1996) tarafından ileri sürülmüş DF-GLS testi, ADF testi ile karşılaştırıldığında, daha iyi bir performansa sahip olduğu ve aynı zamanda bilinmeyen ortalama ve trend söz konusu olduğunda da etkin sonuçlar verdiği ileri sürülmüştür.

Birim kök testlerinde otokorelasyonun ortadan kaldırılabilmesi için bağımlı değişkenin sadece kendi gecikmeli değerleri kullanılarak yapılan regresyon analizinde en küçük bilgi kriteri değerine sahip olan modelin gecikme sayısı, uygun gecikme sayısı olarak belirlenir.

Serilerin durağanlık seviyelerini tespit edebilmek için kullanılan birim kök testi sonuçları Tablo 1'de gösterilmiştir.

| Düzey | Değişken | ADF | DF-GLS | PP | Fark | Değişken. | ADF | DF-GLS | PP |
|---|---|---|---|---|---|---|---|---|---|
| | SANAYİ | -0.11 (3) | 1.53 (11) | -3.65 (3)*** | | SANAYİ | -2.88 (3)* | -0.47 (11) | -19.85 (9)*** |
| Sabitli | PORTFOY | -7.22 (0)*** | -6.90 (0)*** | -7.28 (3)*** | Sabitli | PORTFOY | -8.24 (3)*** | -12.75 (0)*** | -60.31 (93)*** |

**Not:** ADF testinde; MacKinnon (1996) kritik değerleri, sabit için %1, %5 ve %10 seviyesi için sırasıyla -3.485, -2.885, -2.579 ve sabit+trend için -4.035, -3.447, -3.148'dir. Parantez içindeki sayılar, Schwarz kriterine göre belirlenen gecikme uzunluğunu göstermektedir. DF-GLS testinde; LM istatistiği asimptotik kritik değeri, sabit için %1, %5 ve %10 seviyesi için sırasıyla -2.591, -1.944, -1.614 ve sabit+trend için -3.602, -3.1772'dir. Parantez içindeki sayılar, Schwarz kriterine göre belirlenen gecikme uzunluğunu göstermektedir. PP testinde; MacKinnon (1996) kritik değerleri, sabit için %1, %5 ve %10 seviyesi için sırasıyla -3.483, -2.884, -2.579 ve sabit+trend için -4.035, -3.447, -3.148'dir. Parantez içindeki sayılar, Newey-West optimal uyarlama gecikmelerini göstermektedir. ***, ** ve *, sırasıyla %1, %5 ve %10 seviyesinde anlamlılığı ifade etmektedir.

*Tablo 1. Birim Kök Testi Sonuçları*

Portföy yatırımları değişkeni düzey değerinde, imalat sanayi üretim endeksi ikinci farkında doğrudan yatırımlar değişkeni ise birinci farkı alındıkları durağan olmaktadır. Doğrusal birim kök testlerinin birbirlerine göre üstünlükleri ve serilerin uzun hafıza gösterme olasılıkları göz önüne alınmalıdır. Değişkenlerin durağanlık seviyelerinin belirlenmesinin ardından nedensellik ilişkisinin varlığı analiz edilmiştir.

### 4.3 Nedensellik Analizi

Nedensellikle ilgili literatürde yer alan ilk çalışmalar, serilerin durağan olmaması durumunda değişkenlerin farkını alarak nedensellik analizlerinin yapılmasını önerilmiştir. Granger (1987) ise durağan olmayan fakat aralarında eşbütünleşme ilişkisi olan değişkenler için nedensellik sınamalarının hata düzeltme modeli üzerinden araştırılması gerektiğini belirtirken Toda ve Yamamoto (1995), seriler arasındaki nedensellik ilişkisini araştırırken gecikmesi arttırılmış VAR (k+dmax) modelinin daha üstün sonuçlar verdiğini simülasyon çalışmaları sonucunda belirlemişlerdir (Çevik ve Cural, 2013:129). Serilerin bütünleşme dereceleri veya aralarındaki olası eşbütünleşme ilişkisi bu testin geçerliliğini etkilememektedir (Yılancı ve Özcan, 2010: 28). Böylece, ilgili yöntemin kullanımı ile serilerin bütünleşme derecesinin yanlış tespit edilmesi ile ilgili risk minimize edilmektedir (Yavuz, 2006:169).

Toda-Yamamoto nedensellik analizinde, k gecikmeli VAR modeli parametrelerine kısıtlama testleri uygulamak için geliştirilmiş bir Wald testi kullanır. Bu test, k serbestlik dereceli asimptotik olarak $X^2$ dağılımlıdır. Serilerin düzey değerlerine uygulanabilen bu prosedürün tamamlanması iki adımdan oluşur. Birinci adım, optimal k gecikme uzunluğunun ve sistemdeki seriler için maksimum bütünleşme derecesinin ($d_{max}$) belirlenmesini içerir. VAR modelinde en uygun gecikme uzunluğunu Olabilirlik Oran Testi (LR), Son Tahmin Hatası (FPE), Akaike Bilgi Kriteri (AIC), Schwarz Bilgi Kriteri (SC) ve Hannan-Quinn Bilgi Kriteri (HQ) kullanılarak tespit edilmektedir. En uygun gecikme uzunluğu, LR testi dışındaki tüm testlerde, en küçük değere göre belirlenmektedir. Optimal gecikme uzunluğu (k) ve maksimum bütünleşme derecesi ($d_{max}$)'ın belirlenmesiyle birlikte toplamda $k + d_{max}$ gecikme uzunluğuna sahip geliştirilmiş VAR modeli tahmin edilebilir (Koç ve Değer, 2010:88). Tahmin edilen eşitlikler aşağıdaki gibidir:

$$Sanayi_t = \sum_{i=1}^{k+d_{max}} \alpha_{1i} Sanayi_{ti} + \sum_{i=1}^{k+d_{max}} \beta_{1i} Portf\ddot{o}y_{ti} + \sum_{i=1}^{k+d_{max}} \theta_{1i} \dot{I}hracat_{ti} + \varepsilon_{1t} \qquad (3)$$

$$\dot{I}hracat_t = \sum_{i=1}^{k+d_{max}} \alpha_{2i} Sanayi_{ti} + \sum_{i=1}^{k+d_{max}} \beta_{2i} Portf\ddot{o}y_{ti} + \sum_{i=1}^{k+d_{max}} \theta_{2i} \dot{I}hracat_{ti} + \varepsilon_{1t} \qquad (4)$$

$$Portf\ddot{o}y_t = \sum_{i=1}^{k+d_{max}} \alpha_{3i} Sanayi_{ti} + \sum_{i=1}^{k+d_{max}} \beta_{3i} Portf\ddot{o}y_{ti} + \sum_{i=1}^{k+d_{max}} \theta_{3i} \dot{I}hracat_{ti} + \varepsilon_{1t} \qquad (5)$$

(3) nolu denklemde, portföy değişkeninden sanayi değişkenine doğru nedensellik ilişkisinin varlığını belirlemek amacıyla $H_0 : \beta_{1i} = 0$ hipotezi düzeltilmiş Wald testi kullanılarak sınanmıştır. (4) nolu denklemde, portföy değişkeninden ihracat değişkenine doğru nedensellik ilişkisinin varlığını belirlemek amacıyla $H_0 : \beta_{2i} = 0$ hipotezi düzeltilmiş Wald istatistiği kullanılarak test edilmiştir. Sanayi ve ihracat değişkeninden portföy değişkenine doğru nedensellik ilişkisinin varlığı ise, sırasıyla $H_0 : \alpha_{3i} = 0$ ve $H_0 : \theta_{3i} = 0$ hipotezlerinin sınanmasıyla belirlenmektedir.

Hacker ve Hatemi-J (2006) kritik değerlerin hesaplanmasında karşılaşılan zorlukları gidermek için bootstrap simülasyon tekniğini geliştirmişlerdir. Bu yaklaşımın geliştirilmesindeki temel unsurlar Mwald test sonuçlarının kısa dönemleri kapsaması durumunda yanlı sonuç vermeleri, tahmin edilen kalıntıların dağılımındaki çarpıklıklar ve artıkların varyansının heterojen bir yapı sergilemesidir (Tang ve Chng, 2011:6818). Toda-Yamamoto (1995) modeli asimptotik dağılım teorisi doğrultusunda uygulanmaktadır. Hacker ve Hatemi-J (2006) örneklem sayısı küçük olduğunda asimptotik dağılım teorisinin güçlü bir dayanak olamayacağını ve bu gibi durumlarda kaldıraçlı bootstrap simülasyon yönteminin kullanılmasını önermektedirler. Bu teknikle, nedensellik testinin ampirik büyüklük özellikleri iyileşmekte ve Mwald testi farklı durumlarda bile gerçek değerine yaklaşmaktadır (Yıldırım ve Kesikoğlu, 2012:142).

| | | | Bootstrap critical values | | |
|---|---|---|---|---|---|
| | k+d$_{max}$ | MWALD | 1% | 5% | 10% |
| SANAYİ $\not\Rightarrow$ PORTFOY | 4 | 5.881 (0.208) | 12.330 | 8.231 | 6.443 |
| PORTFOY $\not\Rightarrow$ SANAYİ | 4 | 6.866 (0.143) | 16.684 | 11.833 | 9.789 |
| IHRACAT $\not\Rightarrow$ PORTFOY | 5 | 4.177 (0.524) | 16.403 | 11.594 | 9.535 |
| PORTFOY $\not\Rightarrow$ IHRACAT | 5 | 4.775 (0.443) | 16.183 | 11.725 | 9.556 |

Not: Parantez içindeki değerler Toda-Yamamoto asimptotik sonuçlarını göstermektedir. Optimal gecikme uzunluğu, SIC bilgi kriterlerine göre belirlenmiştir. Portföy yatırımları ve sanayi üretim endeksi için, optimal gecikme uzunluğu, (k=2); maksimum bütünleşme derecesi (dmax=2)'dir. Portföy yatırımları ve ihracat için optimal gecikme uzunluğu, (k=3); maksimum bütünleşme derecesi (dmax=2)'dir. Uygun kritik değerleri elde edebilmek için 10.000 Bootsrap simülasyonu yapılmıştır.

*Tablo 2. Doğrusal Toda- Yamamoto Nedensellik Testi Sonuçları*

Toda-Yamamoto asimtotik değerleri göz önüne alındığında, portföy yatırımları ile sanayi üretim endeksi ve ihracat arasında nedensellik ilişkisi tespit edilememiştir. Hacker ve Hatemi-J bootstrap nedensellik analizi sonucunda da kritik değerlerin Mwald istatistik değerinden büyük olması nedeniyle değişkenler arasında nedensellik ilişkisi yoktur. Bu durum, portföy yatırımlarının Hollanda hastalığına yol açan bir değişken olarak değerlendirilemeyeceğini ifade etmektedir.

## 5 Sonuç

Hollanda Hastalığı, Hollanda'nın doğalgaz rezervlerini hızlı bir şekilde çıkarıp dünya piyasalarında satmasıyla ve doğalgaz gelirlerinden dolayı, önemli miktarda döviz girdisi elde etmesinin sonucunda, ulusal parasının değerlenmesi ve doğalgaz gelirlerinin yatırıma değil de tüketime yönelmesi şeklinde ortaya çıkmıştır. Bu hastalık, yapı itibariyle ülkenin sahip olduğu doğal kaynakların, ülkedeki üretimi ve sanayiyi olumsuz etkilemesi sonuçları doğurmaktadır.

2001 yılından bu yana Türkiye varlık satışları yapmış, ülkeye gelen sıcak paraya çok büyük maliyetler ödemiş, borçları artmış, elde ettiği dış kaynaklarla ürettiğinden fazlasını tüketen bir ülkeye dönüşmüştür. Bu gelişmelerin temel sebebi TL'nin aşırı değerlenmiş olmasıdır. Ülke ekonomisi açısından olumsuz yönleri çok önemli boyutlarda olan TL'nin aşırı değer kazanması, bunun yanında Türkiye'deki bankalar ve Türk sanayisi için, geçici ve kısa vadeli fırsatlar da yaratmıştır. Sanayi, düşük faizle yurt dışından temin ettiği borçları, ucuzlayan dövizle ödediğinde, zaman zaman net kazanç dahi elde etmiştir. Ancak bu durum şirketlerin açık pozisyonları itibarıyla kur ve kriz riski taşımaktadır. Diğer yandan, ülkemizde üretim sanayisinin en büyük sorunu, doğrudan yabancı yatırımlarının ticarete konu olmayan sektörlere yönelmesi ve imalat sanayi alt sektörlerinin cazibesini kaybetmesidir.

Ülke ekonomisi için önemli getiri sağlayacak doğal kaynakları olmayan ülkelerde Hollanda hastalığı semptomlarının görülmesi, bu ülkeler için işçi dövizleri ve tarımsal ürün ihracı gibi döviz girişleri ile ilişkilendirilen araştırmaların yapılmasına neden olmuştur. Bu çalışmada, portföy yatırımlarının Hollanda hastalığına yol açıp açmayacağı Türkiye ekonomisi için 2006:01-2013:12 dönemi için test edilmiştir. Çalışmada, 2006:01-2013:12 dönemi için aylık olarak elde edilen portföy yatırımları, sanayi üretim endeksi ve ihracata ilişkin seriler ADF ve Df-GLS birim kök testine tabi tutulmuştur. Değişkenler arasındaki nedensellik ilişkisi, Toda ve Yamamoto (1995) tarafından geliştirilen nedensellik analizi ve Hacker-Hatemi-J yöntemine dayalı bootstarp metodu ile test edilmiştir. Analiz sonuçlarına göre, portföy yatırımları ile sanayi üretim endeksi ve ihracat arasında nedensellik ilişkisi tespit edilememiştir. Elde edilen bulgular, Türkiye ekonomisinde portföy yatırımlarının Hollanda hastalığına yol açan bir değişken olarak değerlendirilemeyeceğini ifade etmektedir.

# Geçiş Ekonomilerine Yönelik Doğrudan Yabancı Sermaye Yatırımları: İhracata Yönelik mi, Yoksa İthal İkameci mi?

# Foreign Direct Investment in Transition Economies: Is It Related to Export Expansion or Import Substitution?

Prof. Dr. Cevat Gerni (Doğuş University, Turkey)

Prof. Dr. Selahattin Sarı (Beykent University, Turkey)

Prof. Dr. Ömer Selçuk Emsen (Atatürk University, Turkey)

Dr. Burhan Kabadayı (Erzincan University, Turkey)

## Abstract

It is propounded that there are two motivations behind foreign direct investments (FDI). One of them is to invest in foreign countries because of trade barrier to export. In this case foreign investors operate in import substitution industries (ISI). The second fact to invest in another country away from homeland is to get benefit from cost advantages such as cheap labor and inputs, positioning closed to developed countries. With this aspect foreign investors operate in export oriented sectors (EOS). The economic consequences were discussed lighting on study's aim examining the FDI to Transitions Countries whether are ISI or EOS. The foreign direct investments to Transitions Countries were investigated by panel data analysis. First and second generation unit root tests and cross section dependency tests were applied. Long and short term regressions were realized. The data set were obtained from Word Bank Data Base and annually data were collected between 1993 and 2012. Theoretically and statistically expected coefficients and coefficient's sign for explanatory variables have been obtained. It is as a result observed that the countries have higher internal market potential to take foreign direct investments to import substitution industries. The countries close to developed economies have been drawing foreign direct investments to export oriented sectors.

## 1 Giriş

Doğrudan yabancı sermaye yatırımları (DYSY)'nın bir ülkeye yönelme motifleri arasında liberal yapıların varlığının başta geldiği söylenebilir. Liberal yapıdan da kast edilen her şeyden önce, genel anlamda siyasal liberalizasyon olgusudur. Siyasal liberalizasyon, demokratikleşme ve hukukun üstünlüğü esasları çerçevesinde yabancı sermayeye güven veren en temel unsurdur. Dolayısıyla siyasal liberalizasyon ve paralel olarak ekonomik liberalizasyon uygulamaları genelde at başı gider; yani kuvvetli liberalizasyon uygulamalarında, öncelikle kurumsal anlamda siyasal düzenlemeler ve akabinde ekonomik düzenlemeler ile liberalizasyona geçişler söz konusu olmaktadır. Burada ekonomik liberalizasyon uygulamaları ise dışa açıklıkla veya ihracata yönelik büyümeyle eşanlamlı kullanılır ve ihracata yönelik büyüme argümanı büyümenin de lokomotif gücü olarak kabul edilir. Ekonomik liberalizasyon boyutunun daha çok sermaye hareketlerine ilaveten mal ve hizmet hareketlerinde olduğu görülmektedir. Özellikle 1980'lerin ekonomik büyüme trendine (%3.8) göre 3 misli kadar mal ve hizmet ithalatında genişleme (%12.6) olurken; DYSY ise 10 katı kadar genişleme (%41) göstermiştir (Kumar, 2012: 87; Bajo-Rubio ve Montero-Muñoz, 1999: 1; Falk ve Hake, 2008: 7). Büyüme, dış ticaret ve yabancı sermaye yatırımlarında gözlenen değişimler ışığında, 1980'lere kadar ticaretin DYSY'yi etkilediği gözlenirken; 1980'lerle birlikte bu ilişkinin tersine döndüğü, yani DYSY'nin dış ticareti etkilediği dikkat çekmiştir (Fontagné, 1999: 5).

Diğer taraftan ticaret ile yabancı sermaye giriş ve çıkışları açısından kısıtların olmadığı yapı, yani ekonomik anlamda liberalize edilen piyasalar, yabancı sermaye çekme yeteneğinin yüksek olduğu piyasalardır. Bu çerçevede ekonomik liberalizasyon uygulamalarını destekleyen unsurlardan olan dünya ekonomisi ile bütünleşme birinci-en-iyi teorisi olarak nitelendirilirken; bunun da GATT ve şimdiki adıyla WTO ile gerçekleştirildiği açıktır. Birinci-en-iyinin sağlanamadığı ya da yeterli ölçüde dünya piyasaları ile entegre olunamadığı durumlarda, bu kez bulunulan bölgedeki ülkelerle birleşme hareketleri bölgeselleşme veya ekonomik bütünleşme söz konusudur ki, buna da ikinci-en-iyi adı verilir. Güçlü ekonomiler ile entegrasyona giden ve ikinci-en-iyiyi uygulamaya koyan ülkelerin temel amacı, ortağı olduğu gelişmiş ülkelerden yabancı sermaye çekerek yayılma etkileri ve ihracat artışı yoluyla ekonomik büyümesini tetiklemeye çalışmaktır (Pacheco-López, 2005: 1157). DYSY'nın asli fonksiyonu gittiği ülkenin rekabet gücünü etkileyerek dış ticaret yapısını ya da bileşenlerini de değiştirmektedir. Dolayısıyla ülkenin dış ticaret yapısı ve DYSY'nin miktarı ve sektörel dağılımındaki değişmeler, ülke açısından ileride ortaya çıkacak değişimleri ve gelecek olan yabancı sermaye miktarını etkilemek suretiyle rekabet gücünü artırıcı rol oynayacaktır (Çivi ve diğ., 2008: 5). Liberalizasyon uygulamalarına yönelmede ikinci-en-iyi uygulamalarına temel örneklerden biri de Meksika'nın ABD ve Kanada'nın içerisinde bulunduğu NAFTA'ya girme sürecidir. Bu süreç ile birlikte Meksika'ya başta ABD olmak üzere çoğu ülkeden DYSY'nın yöneliminde önemli sıçramalar yaşandığı uygulamada dikkati çeken

en temel örnekler arasında yer alır. Özellikle 1985'de DYSY'nın payı %0,25'lerde olan Meksika ekonomisi 2000'li yıllarda %3,30'lara kadar sıçrama kaydetmiştir (Pacheco-López, 2005: 1159-1162).

Giderek artış gösteren sermaye hareketliliği ve bunun içerisinde önemli bulunan DYSY'nin ekonomik büyümenin de en temel belirleyicilerinden biri olduğu ileri sürülür. Şöyle ki, Neo-klasik Solow tipi büyüme modelinde teknoloji ve emeğin büyümedeki etkileri dışsal kabul edilirken, sermaye ve bunun içerisinde DYSY'nin büyümeyi artırdığı, ancak uzun dönemli büyüme motifinde teknolojinin ve nüfusun büyümeyi daha olumlu etkileyeceği kabul edilir (Kalirajan ve diğ., 2009: 5). Dolayısıyla kısa dönemde ekonomik büyümede sermaye unsuru merkezi noktada yer almakta; tasarruf ve döviz açığı yaşayan ülkelerde yabancı sermaye büyümenin lokomotif gücü olmaktadır. Özellikle yurtiçinde üretim, istihdam ve dış ticareti etkilemesi nedeniyle yabancı sermayenin en sağlamı da şüphesiz doğrudan yabancı sermaye yatırımlarıdır.

Neo-klasik büyüme formuna ilaveten geleneksel dış ticareti açıklamaya yönelik Neo-klasik dış ticaret teorilerinden faktör donatımı ya da literatürdeki tanımlamasıyla Heckscher-Ohlin-Samuelson teorisi faktör hareketliliğinin sıfır olduğu varsayımı altında hangi ülkenin hangi faktör ağırlıklı üretimde bulunup ihracata yöneleceğini açıklar. Bu çerçevede ülkeler arasındaki faktör fiyatları farklılığının dış ticaret akımları ile dengeleneceği kabul edilir. Ancak, uygulamada ticaret önündeki engeller, mal ve hizmet ticaretinde azalmaya yol açmakta ve buna karşılık faktör hareketliliğini artırmaktadır. İlk defa Mundell (1957) tarafından ortaya konulan çalışmada ihracat ile DYSY dış piyasalara ulaşmanın alternatif bir yolu haline gelmiştir. Daha sonraki çalışmalarda ticaret ve yabancı yatırımlar, tamamlayıcı olmaktan çok, birbirinin ikamesi olabileceğine (Markusen, 1983; Helpman, 1984) vurgu yapılmıştır. Burada ticaret ve yabancı sermaye arasında belirli bir eşik değere ulaşıldığında, ihracatta belirli avantajlar sağlayan ülkenin daha iyi bir şekilde bu pazarın özel ihtiyaçlarını karşılıyor olması, hedef pazara yönelim amacı DYSY'nin nedeni olabilmektedir. Dolayısıyla bu son argümanda DYSY ihracat piyasalarını sağlamlaştıran ve büyüten bir araç haline dönüşmüştür (Bajo-Rubio ve Montero-Muñoz, 1999: 3).

Mal ve hizmet piyasaları ile sermaye hareketlerindeki liberalizasyon uygulamaları DYSY'yi uyarıcı etkide bulunurken, DYSY da teknoloji transferi (bilgi, teknik ve pazarlama yeteneği organizasyonu ve yönetim sistemleri, yeni materyaller üretimi ve pazar imkanları) yoluyla ekonominin verimlilik ve etkinliğinin artırılmasını ve ihracat yoluyla karşılaştırmalı üstünlüklerin etkin teşvikini sağlar (Kumar, 2012: 87). Diğer bir ifadeyle piyasa yönelimli ekonomiler ihracatçılara ve yatırımda bulunmak isteyen yatırımcılara önemli fırsatlar sunarken, bu bağlamda DYSY da özel sektörü teşvik edici ve beşeri kaynakların kapasitesini artırmaktadır. DYSY girişlerinin temel motifleri dikkate alındığında; yabancı yatırımcıların (i) pazar arayışı, (ii) kaynak veya varlık arayışı ve (iii) etkinlik arayışı içeresinde oldukları söylenebilir. Pazar arayışının motifinde yerel veya bölgesel pazarlara ulaşma düşüncesi yatmaktadır. Yerel pazara ulaşma motifi daha çok ithal ikameci sanayileşme (İİS) ile eşanlam taşırken, bölgesel pazara ulaşma motifi ise ihracata yönelik sanayileşme (İYS) ile paralellik göstermektedir (Bhatt, 2013: 162). DYSY motifinde ülkenin kendi bünyesine yabancı sermaye çekmesinin yanı sıra ülkenin dışarıda yatırım yapma motifleri farklılık gösterirken, içe dönük sermayenin istihdam ve üretim etkilerine karşılık, dışa sermaye veren ülkelerde de bu göstergeler açısından ters etkilerin olduğu söylenebilir. DYSY'nin genellikle çok uluslu şirketler eliyle yürütüldüğü dikkate alınırsa, Helpman ve diğ. (2003) tarafından da belirtildiği gibi DYSY iki temel motifte görülür. Yatay DYSY nihai tüketiciye daha yakın olacak şekilde veya taşıma maliyetleri nedeniyle yatırıma yönelir. Dikey DYSY maliyet avantajlarına göre farklı ülkelerde üretim sürecinin her bir aşamasında bulunmasıdır. Dolayısıyla yatay DYSY ihracat üzerine negatif etkiye sahiptir ve böylece aralarında ikame ilişkisi ortaya çıkar (Falk ve Hake, 2008: 5-7; Wilamoski ve Tinkler, 1999: 25). Buna karşılık DYSY'nin kendi ekipman ve girdisini geldiği ülkeden ya da dışarıdan temin etmesiyle kalkınma sorunu yaşayan AGÜ/GOÜ'lerin kurulum aşamasında ithalatı azalttığı ileri sürülmektedir. Yatırımın daha sonraki aşamasında ise çıktı türü, verimliliğin yayılma etkileri ve diğer endüstrilerle ilişkileri, bir ülkenin ithalatında DYSY'nin etkilerine işaret eden unsurlardır. Özellikle DYSY yerel hammadde ve ara malı kullanırsa, ithalatı kısıcı etkisi ciddi anlamda görülmeyebilir. Aksine, hammadde, beşeri sermaye ve diğer gayrı maddi aktifler gibi ithal edilen girdilere dayanıyorsa, bu durumda ithalatı artırıcı etkisi açıktır. Şayet DYSY ile elde edilen çıktı ithal edilen diğer ürünlerin alternatifi konumundaysa, ithalatı azaltıcı etkiler doğurması olasıdır. Diğer bir ifadeyle DYSY ithal ikameci endüstrilere yoğunlaşmışsa, daha önceden ithal edilen mallar şimdi yabancı yatırımcılar tarafından yurt içerisinde üretileceğinden ithalatı negatif yönde etkilemesi beklenir (Hailu, 2010: 125). DYSY'nin bir ülkeye yönelmesinin ister ithal ikameci, ister ihracata yönelik motiflerle olsun, gittiği ülkede istihdam ve ücret düzeyine etkilerinin belirgin olduğu açıktır. Ayrıca tarife artışları ya da ticareti sınırlayıcı politika uygulayan ülkelerin uyguladıkları kısıtlara karşı o ülke piyasasında yönelim DYSY'nın yönelme motiflerinden biri konumundadır. Diğer taraftan bir ülkenin sahip olduğu faktör stokunun sağlayacağı avantajlar ya da o ülkenin geniş bir pazarına ulaşacak bir entegrasyona gitmesi de ihracat motifiyle DYSY'na örnektir (Di Mauro, 2000: 10-11).

## 2 Literatür İncelemesi

Bu çalışmada temel hipotez, DYSY'nin ihracata yönelik sektörlere mi, yoksa ithal ikameci sektörlere mi yönelik olup olmadığını ekonomik sistem değişimine giden ülkeler özelinde araştırılmasıdır. Çalışmada geçiş

ekonomilerinin 1991'den sonraki süreçlerinin liberal boyut ağırlıklı olduğu dikkate alınırsa, liberal boyut ile dışa açıklık ve dolayısıyla DYSY arasındaki ilişkilerin İYS boyutunda olması beklenir. Ancak, geçiş süreci ile birlikte yurtiçinde yaşanan üretim darboğazları bu ekonomilerin iç piyasasını tatmin etmeye yönelik yatırımları uyarıcı etkiler ortaya çıkmıştır ki, bu yönüyle DYSY'nin daha çok İİS motifiyle yönelim içerisinde olduğu söylenebilir. Gerek İYS, gerekse İİS motifleriyle olsun, bu ülkelerin DYSY çektikleri, ancak hangi türden yabancı sermayenin dominant olduğu, yarattığı sonuçlar itibarıyla ilgiye değerdir. Bu nedenle çalışmaya temel teşkil edecek İİS ya da İYS boyutunun modellemesinin yapılabilirliğinin sağlanabilmesi amacıyla, literatürdeki çalışmaların incelenmesi yoluna gidilmiştir. Literatürde DYSY ile ihracat arasında çalışmalarda yaygınlık dikkat çekmektedir. Buna karşılık DYSY ile ithalat arasında doğrudan ilişkilerin araştırıldığı çalışmalardan ziyade, ihracatı ve ithalatı kapsayacak şekilde dış ticaret üzerine ilişkilerin araştırıldığı çalışmaların yaygın bir şekilde bulunduğu görülmektedir.

## 2.1 İhracata Yönelik DYSY Üzerine Literatür

Bajo-Rubio ve Montero-Muñoz (1999), üçer aylık verilerle 1977-1992 arası dönem için İspanya'da ihracat bağımlı değişken alınmak üzere dış yönelik DYSY arasındaki ilişkileri incelerken, modele dünya geliri ile ihracat nispi fiyatları da vekil değişken olarak dahil etmişlerdir. DYSY ile ihracat arasında eş-bütünleşme ilişkisi yakalandığından, kısa dönemli ve uzun dönemli ilişkiler bağlamında yapılan nedensellik testlerinde DYSY'den ihracata doğru tek yönlü ve uzun dönemli ilişkilerin varlığı tespit edilmiştir. Dolayısıyla DYSY'nin ihracatı uyarıcı etkilerinin olduğu ileri sürülmüştür (Bajo-Rubio ve Montero-Muñoz, 1999: 8-12).

Di Mauro (2000) tarafından yapılan ve çekim modellerinin kullanıldığı çalışmada ekonomik bütünleşmenin DYSY ve bunun da ihracat üzerine etkisini analiz etmiştir. Bu bağlamda tarifeler, tarife dışı engeller ve döviz kuru oynaklıkları da ilave kontrol değişkenler olarak alınmıştır. Özellikle dikey ve yatay DYSY ile ihracatçı olmaktan ziyade, ülkedeki engellere bağlı olarak ticari yapıdaki kötüleşmeye bağlı olarak ihracatta bulunmayı terk edebildikleri gözlenmiştir. Dolayısıyla ihracat yapmaktansa, o ülke iç piyasasında üretimde bulunmak daha anlamlı olmaktadır ki, ihracatın ve DYSY'nın tamamlayıcı ya da ikame olup olmadığı da Graham (1996)'ın yaklaşımı izlenerek ele alınmış ve bu çerçevede çekim modeli kullanılmıştır. Çalışmadan elde edilen bulgularda, teorik beklentinin aksine tarifelerdeki artışların DYSY üzerine etkisinin olmadığı, ancak döviz kurları ile taşıma maliyeti unsurlarının etkisinin daha fazla olduğu tespit edilmiştir. Diğer taraftan ihracat ile DYSY arasında da belirgin bir ilişkinin olduğu ve bu ilişkinin daha çok ihracattan DYSY'ye yönelik olduğu tespit edilmiştir (Di Mauro, 2000: 12-22).

Hsiao ve Hsiao (2006), 1986-2004 arası veri dönemi için 7 güney-doğu Asya (Çin, Kore, Tayvan, Singapur, Malezya, Filipinler ve Tayland) ekonomisinde reel GSYİH, reel ihracat ve reel DYSY arasındaki ilişkileri araştırmışlardır. Bu 7 ekonominin her biri için Granger nedensellik ilişkilerini bulmak amacıyla üç değişkenin VAR ve VECM kalıpları tahmin edilmiştir. DYSY'nin GSYİH üzerine doğrudan ve ihracat üzerine de dolaylı etkilerinin olduğu tespit edilmiştir. Diğer bir ifadeyle panel nedensellik test sonuçlarında DYSY ihracat ve GSYİH üzerinde etkili iken; ihracat ve GSYİH arasında çift yönlü nedensel ilişkinin varlığı görülmüş; dolayısıyla DYSY'nin ihracatı ve ihracatın da GSYİH'yı uyardığı belirlenmiştir (Hsiao ve Hsiao, 2006: 8-21).

Marinescu ve Nicolae (2007), 1996-2006 arası dönem için Romanya ekonomisine giren DYSY'nin ihracat ile olan ilişkilerini incelerken, imalat sanayinde Balassa tarafından geliştirilen rekabet gücü endeksi yoluyla rekabet gücündeki değişimin yabancı sermaye üzerine yansımalarını tanımlayıcı istatistiklerle inceleme konusu yapmıştır. İncelemelerde Romanya ekonomisinde DYSY ile ihracat arasında ilişkinin varlığı ispatlanamamıştır. Ancak, içe yönelen sermayenin ihracatçı sektörlerden ziyade yurtiçi talebi karşılama motifinde olduğu ve rekabet gücünü dikkate almadığı belirlenmiştir (Marinescu ve Nicolae, 2007: 1-17).

Falk ve Hake (2008), 1979-2004 arası dönem için 7 Avrupa Birliği ülkesi (Avusturya, Fransa, Almanya, İtalya, Hollanda, İsveç ve İngiltere) için dışa yönelik DYSY ile ihracat arasındaki ilişkileri panel veri analizleri yardımıyla araştırmışlardır. Dışa yönelik ihracat bağımlı değişken olmak üzere DYSY ve zaman boyutu bağımsız değişken olarak atanmış ve çift logaritmik kalıpta modellenmiştir. Sabit etkiler model sonuçları ile dinamik model sonuçlarında ve GMM tahmininde DYSY'nin ihracatı ve ihracatın da DYSY'nin belirleyicisi olduğu tespit edilirken; ülkenin büyük ekonomi olmasının ve yoğun Ar-Ge yapmasının da bunun en temel belirleyicisi olduğu gözlenmiştir (Falk ve Hake, 2008: 8-21).

Kalirajan ve diğ. (2009), yükselen 6 ekonomide (Şili, Hindistan, Meksika, Malezya, Pakistan ve Tayland) 1970-2005 dönemine ait verilerle DYSY, ihracat ve GSYİH arasındaki ilişkiler araştırılmıştır. Kısa ve uzun dönemli ilişkilerin tespit edilmesi amacıyla yapılan eş-bütünleşme ve VECM analizlerinde bireysel ülkeye özgü zaman serisi analizlerinde kısa dönemli ilişkinin varlığına rastlanmazken, uzun dönemli nedensel ilişkilerin olduğu tespit edilmiştir. Asya ekonomilerinde ülke GSYİH büyüklüğünün uzun dönemde DYSY çektiği ve bunun da ihracatı uyardığı belirlenirken, bir kısım ülkelerde de GSYİH büyümesinin ihracatı uyardığı görülmüştür. Latin Amerika'da ise ihracatın GSYİH'yı ve GSYİH da DYSY'yi uyardığı gözlenmiştir (Kalirajan et al., 2009: 8-15).

Temiz ve Gökmen (2009) tarafından yapılan çalışmada Türkiye ekonomisinde DYSY ile ihracat ilişkileri 1991-2008 dönemi için aylık veriler kullanılarak analize tabi tutulmuştur. Eş-bütünleşme testi sonuçlarında göre

ihracat ile DYSY arasında uzun dönemli ilişkilerin varlığı tespit edilmiş; VECM analizinde ihracattan DYSY'ye doğru uzun dönemli ilişkinin varlığını ortaya koymuştur. Benzeri ilişki de nedensellik ilişkilerinde yakalanmıştır (Temiz ve Gökmen, 2009: 21-25).

Kumar (2012), 1991-2010 yılları arası için Hindistan ekonomisi üzerine ihracat, DYSY ve GSYİH arasında ilişkilerin araştırdığı çalışmada, korelasyon analizleri ile söz konusu ilişkiler inceleme konusu yapılmıştır. Korelasyon testleri sonucunda, DYSY ile ihracat, DYSY ile GSYİH ve ihracat ile GSYİH arasında sırasıyla 0.95, 0.93 ve 0.99 olarak korelasyon değerleri bulunmuştur. Bulunan yüksek korelasyon değerleri, Hindistan ekonomisinde iktisadi büyümenin ihracata dönük sanayileşmeden güçlü ölçüde etkili (r=0.99) olduğuna işaret etmesinin yanı sıra DYSY ile ihracat arasında (r=0.95) ve DYSY ile GSYİH arasında (r=0.93) söz konusu değişkenlerin birbiri ile kuvvetli ilişkilerinin olduğunu göstermektedir (Kumar, 2012: 89-91).

Xing ve Pradhananga (2013), 1980'den sonra yıllık ortalama %10 büyüyen Çin ekonomisinin 2010 yılında dünyanın ikinci büyük ekonomisi konumuna geldiğini ve bu konumda ihracat ve DYSY'nin önemli rol üstlendiğini ileri sürmektedir. Japonya ve dört Asya Kaplanının sergilediği ihracata yönelik büyüme başarısına benzer şekilde Çin'in gösterdiği performansı 1994-2011 arası dönem için iç ve dış talebin etkileri ile inceleme konusu yapılan çalışmada tanımlayıcı istatistikler kullanılmıştır. Elde edilen bulgularda Çin ekonomisindeki büyümenin dış talep ve DYSY'ye oldukça duyarlı olduğu ve bu kırılganlığına aşılmasında Çin ekonomisinin iç talebindeki genişleme ile dengelenebileceği tespit edilmiştir (Xing ve Pradhananga, 2013: 3).

Bhatt (2013) tarafından yapılan çalışma Vietnam ekonomisinde ihracat bağımlı değişken olmak üzere bunu açıklayacağı düşünülen GSYİH ve DYSY değişkenleri alınmış ve böylece bu değişkenler arasındaki ilişkiler 1990-2008 arası dönem için inceleme konusu yapılmıştır. Uzun dönemli ilişkiler için VAR modellemesine gidilirken, kısa dönemli ilişkiler de ECM ile ortaya konulmuştur. VAR ve eş-bütünleşme analiz sonuçlarına göre her üç değişken arasında uzun dönemli nedensel ilişkiler yakalanmış ve hata düzeltmede de bir dönemli gecikme ile değişkenler arasında ilişkinin varlığı tespit edilmiştir. Yapılan nedensellik testlerinde ise DYSY'nin ihracatın nedeni olduğu tespit edilmiştir (Bhatt, 2013: 168-169).

## 2.2 İthal İkameciliğe Yönelik DYSY Üzerine Literatür

Fontagné (1999) uluslararası ticaret ve DYSY arasındaki ilişkileri 3 OECD ülkesi (ABD, Fransa ve İngiltere) için 1984-1993 dönemi verilerini kullanarak analiz etmiştir. DYSY ve sermaye malı ithalinin dış ticaret dengesi üzerine olumlu etkileri söz konusu olurken, DYSY'nin içe yönelik olması ile dışa yönelik olmasının kökeninde ülkenin ihracatçı sektörlerinin sahip olduğu maliyet avantajları yatarken, dışa yönelimde karşı ülkenin ticari engelleri (vergi ve taşıma maliyeti gibi) bulunmaktadır. Çalışmada kısa dönemde ithalatın ve uzun dönemde ise ihracatın artması bağlamında nihai olarak dış ticaret hacminin arttığı ileri sürülmüştür (Fontagné, 1999: 19-22).

Wilamoski ve Tinkler (1999), 1977-1994 dönemi için yıllık ve üçer aylık verilerle ABD ve Meksika ekonomisine ilişkin olarak ABD'nin Meksika'ya ihracatı ve ithalatı bağımlı değişken olmak üzere reel kur ile ABD'nin Meksika'ya yaptığı DYSY ve kümülatif DYSY kullanılmıştır. Yıllık verilerle regresyon analizleri ve üçer aylık verilerle VAR analizlerinde DYSY'nin ihracat üzerine pozitif etkilerinin bulunduğu tespit edilmiştir. İthalatın ise tamamlayıcılık boyutuyla ticareti artırıcı etkilerinin olduğu görülmüştür (Wilamoski ve Tinkler, 1999: 28-36).

Marchant ve diğ. (2002), 1989-1998 arası dönem için Güney Doğu Asya ekonomilerine (Çin, Japonya, Güney Kore, Singapur ve Tayvan) ABD'nin işlenmiş gıda ihracatı ve DYSY arasındaki ilişkileri analiz etmiştir. Bu çerçevede faiz oranları, döviz kurları, GSYİH, yoğunlaşma oranı ve ihracat fiyatları kullanılmıştır. Regresyon analizi sonuçlarında ABD DYSY ile ihracatının tamamlayıcılık ilişkisi içerisinde olduğu ve faiz oranları, döviz kurları, GSYİH ve yoğunlaşma indeksinin DYSY'nin önemli belirleyicisi olduğu tespit edilmiştir (Marchant ve diğ., 2002: 297-299).

Pacheco-López (2005) tarafından yapılan çalışmada Meksika ekonomisi üzerine 1970-2000 arası dönem için ihracat, ithalat ve DYSY arasındaki ilişkiler araştırılmıştır. Modellemede kullanılan değişkenler dolar cinsinden alınmış olup bütün değişkenler logaritmik formda ele alınmıştır. Değişkenler arasında eş-bütünleşik ilişkilerin ortaya konulduğu çalışmada daha sonraki aşamada değişkenler arasındaki nedensel ilişkiler araştırma konusu yapılmıştır. Yapılan nedensellik testleri sonucunda DYSY ile ihracat arasında ve DYSY ile ithalat arasında çift yönlü nedensel ilişkilerin olduğu tespit edilmiştir. Ancak, liberalizasyon uygulamalarının DYSY'yi teşvik ettiği ortaya konulmasına karşılık, Meksika ekonomisinin büyüme performansı üzerine liberalizasyon uygulamalarının güçlü etkiler doğurmadığı da ortaya çıkmıştır. Şöyle ki, 1970-1993 arası ortalama büyüme performansı %4,3 iken, 1993 sonrası dönemde ortalama büyüme performansı %3,0 olarak gerçekleşmiştir. Bu çalışmada en açık bulgu DYSY ile ithalat arasında ortaya çıkan güçlü bağlardır; zira ithalat yurtiçi ve ihraç ürünler için girdi sağlamak ve daha hızlı ekonomik kalkınma için teknoloji çekmek için talep edilir (Pacheco-López, 2005: 1167-170).

Ahmed ve diğ. (2008), Sahra-altı Afrika ülkelerinde (Gana, Mali, Nijerya, Güney Afrika ve Zimbabve) ihracat, ithalat ve DYSY arasındaki ilişkiler ARDL yaklaşımı ile analiz edilmiştir. Bu çerçevede reel ihracat, reel yurtiçi gelir, partner ülke geliri, reel ithalat, içe yönelik DYSY ile açıklık indeksi ve liberalizasyon göstergeleri kullanılmıştır. Değişkenler arasında kısa ve uzun dönemli nedensel ilişkiler araştırmasında ihracat-büyüme,

ihracat-DYSY, büyüme-DYSY ve büyüme-ithalat arasında ilişkilerin olduğu belirlenmiştir. Ülkeye özgür araştırmalarda ise Gana, Kenya ve Nijerya'da DYSY ile ihracat arasında iki yönlü; Güney Afrika'da DYSY'den ihracata ve Zambiya'da ihracattan DYSY'ye yönelik tek yönlü ilişkilerin varlığı gözlenmiştir (Ahmed ve diğ., 2008: 12-23).

Fillat-Castejón ve diğ. (2008), 1994-2004 arası dönem için 24 OECD ülkesinde hizmet ticareti (toplam hizmetler, taşımacılık, seyahat, iletişim, inşaat, finans ve diğer ticari hizmetler) ve DYSY arasındaki ilişkiler araştırılmıştır. Bu çerçevede çift logaritmik formda hizmet ithali ile GSYİH, nüfus, ele alınan ülkenin ticari partneri ülkeye uzaklığı, hizmet ticaretinde kısıt olup olmadığı ve 1 gecikmeli DYSY alınmış; ikinci modelde ise DYSY bağımlı değişken olmak üzere GSYİH, nüfus, ele alınan ülkenin ticari partneri ülkeye uzaklığı, hizmet ticaretinde kısıt olup olmadığı ve 1 gecikmeli hizmet ithali alınmıştır. Kısa dönem ve uzun dönem analizlere ilişkin olarak elde edilen bulgularda hizmet ithalatı ile DYSY arasında tamamlayıcılık ilişkisinin varlığı tespit edilmiştir (Fillat-Castejón ve diğ., 2008: 9-16).

Hailu (2010), 16 Afrika ülkesi için 1980-2007 dönemine ait verilerle ihracat/ithalat performansı ile DYSY arasındaki ilişkileri analiz etmiştir. Bu çerçevede ihracat, ithalat ve dış ticaret değişkenlerinin GSYİH'ya oranları bağımlı değişken olmak üzere üç model tasarlanmış ve bu modelleri açıklamak üzere reel kur, DYSY'nin 1 gecikmeli değeri, altyapıyı temsilen 1000 kişiye düşen telefon sayısı, dünya geliri, ilgili ülke geliri ve bağımlı değişkenin 1 gecikmeli değeri alınmıştır. Çift logaritmik kalıptaki modele bağlı olarak yapılan regresyon analizi sonuçlarına göre DYSY'nin ihracatı ve ithalatı pozitif ve anlamlı etkilediği tespit edilmiştir. Bulgular Afrika ülkelerinde DYSY'nin ihracatı uyardığı, ancak ithalatı da uyarıcı boyutunun varlığı özellikle bu ülkelerdeki yatırımların ithalata bağımlılığı artırıcı nitelikte olduğuna işaret etmektedir (Hailu, 2010: 125-130).

Kıran (2011), 1992 ile 2008 arası dönem için üçer aylık veri seti ile DYSY ve dış ticaret (ihracat ve ithalat) arasındaki ilişkileri araştırdığı çalışmada, ilgili değişkenlerin GSYİH'ya oranları alınmıştır. İki yapısal kırılmada serilerin seviyede durağanlığının elde edilmesine istinaden yapılan VAR nedensellik testlerinde değişkenler arasında nedensel ilişki yakalanamamıştır (Kıran, 2011: 152-155).

Sharma ve Kaur (2013), 1976-2012 arası dönem için reel verilerle Çin ve Hindistan ekonomisinde DYSY ile dış ticaret (ihracat ve ithalat) arasında nedensellik ilişkilerini araştırılmışlardır. Elde edilen bulgularda Çin ekonomisi için DYSY'den ihracata ve ithalata doğru tek yönlü nedensel ilişkiler tespit edilirken, ihracat ile ithalat arasında çift yönlü nedensellik ilişkilerin olduğu gözlenmiştir. Buna karşılık Hindistan ekonomisinde ise DYSY ile ihracat ve ithalat arasında çift yönlü nedensellik ilişkilerin olduğu; ihracat ile ithalat arasında bu türden ilişkinin yakalanamadığı tespit edilmiştir (Sharma ve Kaur, 2013: 83-88).

## 3   Model ve Uygulama Sonuçları

DYSY açısından bir değerlendirme yapılacak olunduğunda, DYSY girişlerinde belirleyici unsurların literatürde yaygın olarak ele alınanlarından ihracatı artırıcı etkisi ya da ithalatı azaltıcı veya artırıcı unsuru ilgiye değerdir. Bu durum basit bir fonksiyonel forma dönüştürülecek olunduğunda, DYSY'nın İYS'ye yönelik olması halinde, ihracat gelirlerini uyarması beklenir. Şayet DYSY'nin İİS'ye yönelik olması halinde ise, ithalat giderlerini kısması ve dolayısıyla döviz giderlerinde tasarruf sağlanması umulur iken; DYSY'nin ithalata olan bağımlılığı yükseltmesi ise ithalatı artırması ve böylece döviz giderlerini artırması söz konusu olabilmektedir.

$$X = f(F) \tag{1}$$
$$M = f(F) \tag{2}$$

(1) nolu eşitlikte X, ihracatı ve F, DYSY'yi sembolize ederken; (2) nolu eşitlikte de F yine DYSY'yi ve M ise ithalatı ifade etmektedir. (1) nolu forma göre DYSY'nın ihracatı uyardığı ve dolayısıyla bu formatta DYSY girişlerinin ortaya çıktığı ekonomilerde F değerindeki artışların X değişkeni üzerindeki etkilerinin pozitif ve anlamlı olması beklenmektedir. Dolayısıyla DYSY'nın İYS'ye yönelik olduğu ileri sürülebilir. Buna karşılık (2) nolu forma göre ise DYSY'nın ithalatı uyardığı, ancak bu uyarmanın negatif olarak gerçekleşmesi beklenir. Diğer bir ifadeyle DYSY'nin İİS'ye yönelik olması halinde ithalat giderlerinde düşüşler umulmaktadır. Ancak, DYSY'nin ithalata bağımlı bir yapı doğuruyor olması durumunda ise DYSY girişlerinin ithalatı artırması ve bu yönüyle M ile DYSY arasında tamamlayıcılık ilişkisinin olduğu ileri sürülebilir

Yukarıdaki modellerde sadece iki değişken arasında ilişki araştırmasının doğuracağı olası sakıncaları telafi etmek ve ilaveten literatürde yaygın olarak kullanılan değişkenler takviyesinde bulunmak, yani bir tür kontrol değişkenlerin de modele dahil edilmesinde yarar vardır. Literatürün yol gösterdiği ölçüde (1) nolu modele ülkelerin ihracatında karşıt-ticari partner ülkenin gelirinin etkili olacağı düşünülerek, ev sahibi ülkenin en büyük ticari partneri ülkenin milli gelirinin ($Y_f$) modele dahil edilmesi yoluna gidilmiştir [bkz. Bajo-Rubio ve Montero-Muñoz (1999); Hailu (2010)]. Diğer taraftan ihracat fonksiyonunda kurların etkisini dahil etmek üzere literatürde kur oynaklığı [bkz. Di Mauro (2000)] değişkenini temsilen reel kurlar (ReR) modele dahil edilmiştir. Son olarak siyasal liberalizasyon uygulamalarının DYSY'yi uyardığı düşünülerek liberalizasyonu [bkz. Pacheco-López (2005)] temsilen politik haklar (PR) değişkeni de modele dahil edilmiştir. Çalışmanın verileri Dünya Bankası'ndan ede edilmiştir.

Benzer şekilde (2) nolu model kapsamında ülkenin ithalatının yine kendi yurtiçi gelirine bağlı olduğuna dair Keynesyen öngörü çerçevesinde ev sahibi ülke milli geliri ($Y_d$) alınmıştır [bkz. Marchant ve diğ. (2002); Ahmed ve diğ. (2008); Hailu (2010)]. Bir tür rekabet ve fiyat etkisini temsilen de reel döviz kurlar (ReR) değişkeni modele dahil edilmiştir [bkz. Wilamoski ve Tinkler (1999); Marchant ve diğ. (2002); Hailu (2010)]. Son olarak liberal politika uygulamalarının yansıması olarak liberalizasyonu temsilen politik haklar (PR) değişkeni modele eklenmiştir [bkz. Ahmed ve diğ. (2008)]. Bu çerçevede (1) ve (2) nolu modeller aşağıda sırasıyla (3) ve (4) nolu modeller şeklini almıştır:

$$X = f(FTGDP, Y^f, ReR, PR) \tag{3}$$
$$M = f(FTGDP, Y^d, ReR, PR) \tag{4}$$

(3) nolu modeldeki ihracat fonksiyonu ile (4) nolu modeldeki ithalat fonksiyonu çift logaritmik kalıpta aşağıda sırasıyla (5) ve (6) nolu modelle ekonometrik olarak ifade edilmiştir. DYSY bazı durumlarda negatif değer aldığında logaritmik formda verilmemiştir. DYSY'nin ülkelerin GSYİH'lerine oranlanarak elde edilmiş veri kullanılmıştır.

$$\log X_{i,t} = \beta_0 + \beta_1 FTGDP_{i,t} + \beta_2 \log Y^f_{i,t} + \beta_3 \log ReR_{i,t} + \beta_4 PR_{i,t} + \varepsilon_{i,t} \tag{5}$$
$$\log M_{i,t} = \beta_0 + \beta_1 FTGDP_{i,t} + \beta_2 \log Y^d_{i,t} + \beta_3 \log ReR_{i,t} + \beta_4 PR_{i,t} + \varepsilon_{i,t} \tag{6}$$

i=1, …, 11;      t=1993, 1994, …, 2012

(5) ve (6) nolu modellerle ekonometrik tahminlere gidilmesi planlanırken, bu doğrultuda verilerine ulaşılabilen 11 Geçiş Ekonomisine ait yatay kesit gözlemler veri setinin temelini oluşturmuştur. Bu 11 geçiş ekonomisi; Ermenistan, Bulgaristan, Hırvatistan, Çek Cumhuriyeti, Macaristan, Moldova, Polonya, Romanya, Rusya, Slovakya ve Ukrayna'dan oluşmuştur. Çalışmada kullanılan serilerin durağanlık özellikleri Levin, Lin, Chu (LLC) ve Im, Peseran ve Shin (IPS) testleriyle incelenmiştir. Sonuçlar Tablo 1'de verilmiştir.

*Tablo 2: Breitung Birim Kök Testi*

LLC ve IPS testi sonuçları incelendiğinde verilerin birçoğu düzey değerde durağan değildir. LREER ve FDITGDP testlerinin durağanlığı güçlü biçimde ret edilememiştir. Serilerin durağanlığı trendli ve trendsiz testere göre değişiklik arz etmektedir. Bu nedenle seriler Breitung Birim Kök Testleriyle de sınanmıştır. Sonuçlar Tablo 2'de verilmektedir.

Breitung Birim Kök Testi sonuçlarına göre çalışmada kullanılan seriler düzey değerde durağan değilken, birinci dereceden farkta seriler durağan bulunmuştur.

Çalışmada spesifik bir yatay kesit kullanılmıştır. Geçiş ekonomilerinin dış ticareti üzerinde doğrudan yabancı sermaye hareketlerinin etkileri araştırılmaktadır. Spesifik bir yatay kesit örneklemi için kullanılan panel veri analizlerinde sabit etkiler modeli uygun sonuçlar vermektedir (Baltagi, 2008: 14). Geçiş Ekonomilerinin ihracatı ve ithalatı için iki ayrı model oluşturulmuş ve sonuçlar Tablo 3'te gösterilmektedir.

| Bağımlı Değişken LX | | | Bağımlı Değişken LM | | |

**Not:** A ve B %1 ve %5 önem düzeyini belirtmektedir. D.R$^2$ düzeltilmiş R$^2$'yi gösterir. DW Durbin Watson istatistiğidir. Analizlerde white varyans düzeltme yöntemi kullanılmıştır.

***Tablo 3:*** *Tek Yön Sabit Etkiler Panel Veri Analizi Sonuçları*

Çalışmada düzey değerlerde gerçekleştirilen analiz sonuçlarına göre DYSY Geçiş Ekonomileri ihracatı üzerinde istatistiksel olarak anlamlı bir etkiye sahip olmadığı ancak DYSY'nin ithalatı pozitif yönde etkilediği gözlenmiştir. Bu durumda DYSY Geçiş Ekonomilerinde ithalata bağımlı olmakta ve ülkelerin ithalatını arttırmaktadır. Elde edilen bulgular Fontagné (1999), Pacheco-López (2005), Fillat-Castejón ve diğ., (2008), Hailu (2010) ile Sharma ve Kaur (2013) çalışmalarıyla benzerlik göstermektedir.

İhracat ve ithalatı etkileyen en önemli değişkenlerin ihracatta modeli için ticaret yapılan ülkelerin gelirleri ($Y_f$) ve ithalat modeli için ülkenin kendi gelir seviyesi ($Y_d$) olduğu görülmektedir. Her iki değişken de %1 önem düzeyinde anlamlı ve pozitif etkilidir. Ayrıca gelir kat sayısının 1'den büyük olması ($Y_d$'nin 1,29; $Y_f$'nin 1,063) ihracatın ve ithalatın gelire karşı duyarlı olduğunu göstermektedir. Reel döviz kuru değişkeni ise (REER) sadece ihracat için anlamlıdır. İthalat denklemi için anlamlı bir döviz kuru katsayısına ulaşılamamıştır. Ülke içi politik gelişmeler ve liberalizasyon düzeyi ekonometrik modellerde PR değişkeni ile temsil edilmiştir. PR 1 ila 7 arasında değer almaktadır. 1 en özgür seviyeyi, 7 ise özgür olmayan baskıcı yapıyı belirtmektedir. PR değişkeni Freedom House'dan temin edilmiştir. Teorik açıdan beklenildiği üzere PR katsayısı negatif işaretli ve istatistiki açıdan anlamlı bulunmuştur. Yani ülkelerde liberalizasyon ve özgürlükler arttıkça ihracat ve ithalat artmaktadır.

Tablo 3'teki sonuçlar incelendiğinde yüksek R$^2$ değerleri ve düşük DW değeri dikkat çekmekte ve bu durum elde edilen katsayıların güvenilirliğini gölgelemektedir. Bu nedenle her iki modelde kullanılan değişkenler arasında uzun dönemli ilişkilerin varlığı Johansen Eş-Bütünleşme Testleri yardımıyla incelenmiştir. Test sonuçları Tablo 4'te verilmiştir.

| İhracat Modeli İçin | | |
|---|---|---|
| Eş-bütünleşik Vektör Sayısı | İz Değer | Öz Değer |
| 0 | 105.6$^A$ | 102.7$^A$ |
| 1 | 33.95$^B$ | 31.88$^B$ |
| 2 | 14.93 | 12.79 |
| 3 | 20.69 | 20.69 |
| İthalat Modeli İçin | | |
| Eş-bütünleşik Vektör Sayısı | İz Değer | Öz Değer |
| 0 | 116.2$^A$ | 89.12$^A$ |
| 1 | 52.49$^A$ | 44.29$^A$ |
| 2 | 24.56 | 19.01 |
| 3 | 30.02 | 30.02 |

**Not:** A ve B %1 ve %5 önem düzeyini belirtmektedir.

***Tablo 4:*** *Johansen Eş-bütünleşme Testi Sonuçları*

Johansen Eş-Bütünleşme testi sonuçlarına göre her iki modelde de en az 1 eş-bütünleşik vektöre ulaşılmıştır. Elde edilen bu sonuç değişkenler arasında uzun dönemli ilişkilerin mevcudiyetine işaret eder.

Uzun dönemde seriler arasında ilişkiler olmasına rağmen kısa dönemde meydana gelecek olası şoklar makroekonomik denge düzeyinden sapmaya neden olabilir. Kısa dönemli şokların modellerde sapmaya neden olup olmadığı ve değişkenler arasındaki kısa dönemli ilişkiler hata düzeltme modelleriyle incelenmiştir. Sonuçlar Tablo 5'te verilmektedir. Hata düzelte modeli (7) ve (8) numaralı denklemde gösterildiği üzere oluşturulmuştur.

$$\log\Delta X_{i,t} = \alpha_0 + \alpha_1 \Delta FTGDP_{i,t} + \alpha_2 \log\Delta Y^f_{i,t} + \alpha_3 \log\Delta ReR_{i,t} + \alpha_4 \Delta PR_{i,t} + EC*Resid01(-1) + u_{i,t}$$

(7)

$$\log\Delta M_{i,t} = \alpha_0 + \alpha_1 \Delta FTGDP_{i,t} + \alpha_2 \log\Delta Y^d_{i,t} + \alpha_3 \log\Delta ReR_{i,t} + \alpha_4 \Delta PR_{i,t} + EC*Resid02(-1) + u_{i,t}$$

(8)

$$Resid01 = \varepsilon_{i,t} = \log X_{i,t} - \beta_0 - \beta_1 FTGDP_{i,t} - \beta_2 \log Y^f_{i,t} - \beta_3 \log ReR_{i,t} - \beta_4 PR_{i,t} \qquad (9)$$
$$Resid02 = \varepsilon_{i,t} = \log M_{i,t} - \beta_0 - \beta_1 FTGDP_{i,t} - \beta_2 \log Y^d_{i,t} - \beta_3 \log ReR_{i,t} - \beta_4 PR_{i,t} \qquad (10)$$

(7) ve (8) nolu denklemlerde $\Delta$ fark operatörüdür. EC ise hata düzeltme katsayısı, (-1) ise 1 dönemlik gecikmeyi göstermektedir.

**Not:** A ve B %1 ve %5 önem düzeyini belirtmektedir. D.R$^2$ düzeltilmiş R$^2$'yi gösterir. DW Durbin Watson istatistiğidir. EC ise hata düzeltme katsayısını vermektedir. Analizlerde white varyans düzeltme yöntemi kullanılmıştır.

*Tablo 5: Hata Düzeltme Modeli ve Kısa Dönemli Regresyon Analizi*

Tablo 5'teki sonuçlara göre her iki modelde de hata terimi katsayısı negatif işaretli ve istatistiki açıdan anlamlıdır. Geçiş Ekonomileri ihracatı için kurulan denklemde kısa dönemde meydana gelecek olası şoklar bir dönem içerisinde (bir yıl) yaklaşık %16 oranında dengeye ulaşmaktadır. İthalat için kurulan modelde ise şoklara bağlı bir sapma bir dönem içerisinde %32 oranında dengeye ulaşır. Kısa dönemde DYSY Geçiş Ekonomilerinin hem ihracatı hem de ithalatı üzerinde artırıcı etki göstermektedir. Ancak, bu etkiler ithalat üzerinde daha duyarlıdır. İthalat için kurulan hata düzeltme modelinde DYSY'nin katsayısı ihracata nazaran daha yüksektir.

Reel döviz kurları ve politik kalite ise kısa dönemde dış ticaret üzerinde anlamlı etkiye sahip değildir. Politik kalite (PR) ise kısa döneme nazaran uzun dönemde ülkelerin dış ticaret yapısını etkilemekte ve politik kalite arttıkça ülkelerin dış ticaret hacmi artmaktadır. Dolayısıyla ülkelerin liberalizasyonla daha açık bir ekonomi haline gelmelerinin farklı bir yolla gerçekleştirildiği ya da şok etki politikalarıyla uygulamaya konulduğu söylenebilir. Hata düzeltme modelinde Tablo 3'teki sonuçlara nazaran daha düşük R$^2$ değerleri ve görece daha yüksek DW istatistiği değeri elde edilmiştir.

## 4 Sonuç

Bu çalışmada, "Geçiş Ekonomileri özelinde DYSY'nin ülkelerin İYS'lerinde mi, İİS'lerinde mi ortaya çıktığı inceleme konusu yapılmıştır. DYSY'nin ihracat ve ithalat üzerindeki etkiler iki ayrı *tek yön sabit etkiler panel veri analizleriyle* tetkik edilmiştir. Regresyon analizleri verilerine ulaşılabilen 11 Geçiş Ekonomisi için 1993-2012 yılları verileri kullanılarak oluşturulmuş ve bu çerçevede hem uzun dönemli hem de kısa dönemli analizler gerçekleştirilmiştir. Analizler sonucunda elde edilen bulgular şu şekilde özetlenebilir:

i. Çalışmada değişkenler arasında uzun dönemli ilişkinin bulunduğuna Johansen Eş-Bütünleşme testi sonucunda ulaşılmıştır.

ii. Uzun dönemde DYSY ile Geçiş Ekonomilerinin ihracatı arasında anlamlı bir ilişkiye ulaşılamamıştır. Ancak, DYSY'nin ithalat üzerinde ise pozitif ve istatistiki açıdan anlamlı etkileri vardır. Uzun dönem için elde edilen bu bulgular yorumlandığında DYSY'ler İYS'leden ziyade İİS'lere yöneliktir ve DYSY ülkelerin ithalata bağımlılığını arttırmaktadır. Bu yapı Geçiş Ekonomilerinin DYSY tarafından teknik bilgi ve becerilerin (know-how) yeteri kadar kopyalanamadığı veya öğrenilemediği şeklinde

yorumlanabilir ya da DYSY'ler teknik bilgi ve becerilerini paylaşma konusunda isteksiz davranmaktadırlar. Geçiş Ekonomileri DYSY'leri ürkütmeden know-how yeteneği öğrenebilecek yapısal değişikliklere gitmelilerdir. Örneğin belirli sayıda yönetim ve teknik kadroda belirli sayıda vatandaş çalıştırarak söz konusu beceriler yerel piyasalara mal edilebilir. Ayrıca DYSY'lerin Ar-Ge faaliyetlerini ev sahibi ülkede gerçekleştirmeleri yönünde teşvik edilmelidir. Bu vesileyle yurtiçi piyasalara pozitif dışsallık sağlanabilir.

iii. DYSY'nin Geçiş Ekonomileri İYS ve İİS üzerinde kısa dönemde pozitif ve anlamlı etkileri vardır. Kısa dönemde DYSY'nin ihracat ve ithalat üzerindeki etkileri katsayılar dikkate alınarak kıyaslandığında ithalatın daha da duyarlı olduğu gözlenmektedir. Uzun dönemde ise DYSY'nin ihracat üzerinde etkilerinin anlamsızlaştığı yukarıda açıklanmıştır.

iv. Hem uzun dönemde hem de kısa dönemde Geçiş Ekonomilerinin uluslararası mal ve hizmet ticaretini etkileyen en önemli değişkenin ihracat için ticaret ortağı ülkelerin gelirleri ve ithalat için ise ülke gelirleri olduğu gözlenmiştir. Çift logaritmik yapıda elde edilen katsayıların 1'den büyük olması, Geçiş Ekonomilerinin dış ticaret yapılarının gelir değişmelerine çok duyarlı olduğunu gösterir. Bu yapı olası küresel veya lokal krizlerde meydana gelecek gelir düşüşlerinden dış ticaret sektörlerinin önemli derecede etkileneceği şeklinde yorumlanmaktadır. Yani Geçiş Ekonomilerinin dış ticaret yapıları krizlere karşı çok kırılgandır.

v. Reel döviz kuru dış ticaret üzerinde kısa dönemde anlamlı etkiye sahip değildir. Uzun dönemde ise ancak ihracat üzerinde etkisi vardır. Yüksek kur politikası (değersiz yerel para) uzun dönemde ihracatı arttırıcı etki gösterebilir.

vi. Uluslararası Ticaret Teorisine göre demokratikleşme ve liberalizasyon dış ticaret hacmini arttırmakta ve ekonomileri küresel anlamda birbirlerine entegre hale getirmektedir. Bu teorinin sağlaması uzun dönemde Geçiş Ekonomileri üzerinde PR değişkeni ile geçerlilik arz ettiği tespit edilmiştir. Uzun dönemde serbestleşme ve demokratikleşmenin ülkelerin dış ticaret hacmini arttırdığı gözlenmiştir.

Elde edilen bulgular genel olarak değerlendirildiğinde Geçiş Ekonomilerine gelen DYSY'ler daha çok İİS'lerde faaliyet göstermekte ve bu da ithalata bağımlılığı yükselterek ülkelerin ithalatında artışlara yol açmaktadır. Elde edilen bu sonuç politika çıkarımı olarak; Geçiş Ekonomilerinin DYSY'lerden teknik bilgi ve beceriyi elde edebilme yeteneklerini arttırmaya yönelik yapısal değişikliklere gitmesi ve DYSY'lerin Ar-Ge çalışmalarını ev sahibi ülkelerde yapmaları yönünde teşvik edilmesi gerektiğini göstermektedir. Ayrıca İYS'lere yönelik faaliyet gösterecek DYSY'leri ülkelere çekecek düzenlemelerin gerçekleştirilmesi gereği dikkat çekmektedir. Dolaylı yabancı sermaye yatırımlarını çekme adına uygulanacak suni olarak değerlendirilmiş döviz kuru politikalarının uzun dönemde ihracatı olumsuz yönde etkilediği ve böyle bir yapının da cari açıklara neden olabildiği söylenebilir. Dış ticareti etkilemeye yönelik düşük kur politikalarından ziyade teknolojik ve beşeri birikimi arttıracak yapısal politikaların daha kalıcı ve etkili sonuçlar doğuracağı şüphesizdir.

## Abstract

The main purpose of this study is that to test empirically relationship between Intra-Industry Trade (IIT) and Foreign Direct Investment (FDI). In this study, the relationship between IIT and FDI was analysed using time series analysis for the Turkish transport equipment sector. For this purpose, FDI, import and export data in the transport equipment sector were obtained from the Central Bank of the Republic of Turkey and Turkish Statistical Institute. The period of the study has been limited between 2006:01 and 2013:11 due to constraints in the relevant data about the Turkish economy. In this study, the Grubel - Lloyd index have been derived using import and export values for the transport equipment sector in Turkey. This index and FDI in the transport equipment sector has been tested by the Granger causality analysis. The existence empirical and theoretical literature has not been reached any consensus about the relationship between the variables. Some researchers found a bilateral sign between FDI and IIT, while another studies show that there is some presence of unidirectional causality. This study's findings indicate that there is a unidirectional causality from FDI to IIT in the Turkish Transport equipment sector.

## 1  Giriş

Son yıllardaki uluslararası ticaret ve üretim istatistikleri, uluslararası ticaretin yapısını açıklamada geleneksel ticaret teorilerinin yetersizliklerini gün geçtikçe daha net bir biçimde ortaya koymaktadır. Ricardo'nun karşılaştırmalı üstünlükler teorisi ve Heckscher-Ohlin-Samuelson (H-O-S) teorisinde ülkelerin sahip olduğu sektörlerin yapısı, büyüklüğü, hitap ettiği kitle ve tüketicilerin tercihlerine göre şekillenen piyasaların talep yapısı ne kadar benzer özellikler taşır ise birbirleri arasındaki ticaretin miktarı ve sıklığı da o oranda artacaktır şeklinde ifade edilmiştir. Bununla birlikte yapılan ampirik çalışmalar sonucunda ortaya konan ampirik çalışmalar göstermiştir ki, dünya ticaretinin büyük bir kısmı gelişmiş ülkeler arasında yapılan ticaretten oluşmaktadır (Şimşek, 2008).

Karşılaştırmalı üstünlük modelleri genel itibari ile farklı faktör donatımlarına sahip ülkeler arasındaki ticareti açıklamada kullanılan bir kavramdır. Bu modeller, üreticilerin ve tüketicilerin tercihleri birbirine yakın diğer bir ifadeyle faktör donatımları benzer olan ülkeler arasında gerçekleşen ticareti açıklamada ise yetersiz kalmıştır. Başkol (2005), ticaret yapan ülkeler arasındaki gelişmişlik düzeyi yakınlaştıkça bu ülkeler arasında yapılan Endüstri-İçi Ticaret (EİT)'in daha yüksek oranlara çıktığı bulgusunu ortaya koymuştur. Benzer şekilde (Nilson, 1999), kişi başına düşen gelir farklılığı azaldıkça dış ticaret ortağı olan ülkeler arasındaki EİT'nin payının arttığı sonucuna ulaşmıştır. EİT konusunda yapılan teorik ve ampirik çalışmalar, uluslararası ticaret konusunda ve akımlarında EİT'nin öneminin artacağını göstermektedir.

II. Dünya Savaşı sonrasında ekonomik küreselleşmenin diğer bir boyutu ise üretimin küreselleşmesi olarak kendini göstermiştir. Özellikle 1970 sonrası dönemde ülkelerin finansal serbestleşmeye yönelik adımları, bir yandan kısa süreli sermaye hareketlerini artırmışken, öte yanda uzun süreli Doğrudan Yabancı Yatırım (DYY)'larda da önemli artışlara yol açmıştır. DYY'lar, ülkelerin ekonomik büyümesi, istihdam düzeyi, ücret düzeyi, ihracat ve ithalatı üzerinde önemli etkilere yol açabilmektedir. Bu bağlamda DYY'ların EİT ile bir ilişkisinin olup olmadığı literatürde inceleme konusu yapılmıştır.

Bu çalışmanın amacı DYY'lar ile EİT arasındaki ilişkileri, Türkiye örneğinde ele almaktır. Bu amaç doğrultusunda çalışma beş ana başlık altında oluşturulmuştur. Çalışmanın Giriş bölümünü takip eden ikinci kısımda EİT ve DYY'lar arası ilişkileri ele alan teorik ve ampirik literatür ortaya koyulmuştur. Çalışmanın Veri ve Metodoloji başlığında ise Türkiye'deki Ulaştırma Araçları sektöründeki EİT ile DYY'lar arası ilişkiler için ele alınan değişkenler, çalışma dönemi ve yöntemi hakkında kısa bilgiler sunulmuştur. Çalışmanın dördüncü kısmında ise ilgili değişkenlere ait tanımlayıcı istatistikler ile ampirik bulgulara yer verilmiştir. Çalışmanın son bölümünde ise çalışmadan elde edilen teorik ve ampirik bulgular değerlendirilmiştir.

## 2 Endüstri-İçi Ticaret ve DYY: Teori ve Ampirik Literatür

Endüstri içi ticaret, iki ülkenin benzerini üretmedikleri farklı yapıdaki ihtiyaçları olan otomobil, dayanıklı tüketim malları, tekstil gibi endüstriyel ürünleri karşılıklı olarak ihraç ve ithal etmesi olarak tanımlanabilir. Böylece ülkeler arasında belirli ürünlerde iki yönlü ticaret ortaya çıkar. Bu bağlamda sermaye/emek oranı benzer yapıda olan ülkeler arasında endüstri içi ticaret yüksek düzeydedir. Belirli bir endüstride endüstri içi ticaretin yüksek düzeyde olması açık seçik bir karşılaştırmalı üstünlük durumunun ortaya çıkmadığını gösterir. Bu nedenle endüstri içi ticaret karşılaştırmalı üstünlüğü yansıtmaz. Endüstri içi ticarette dış ticaretten sağlanan kazanç, tüketicilere sağlanan çeşitlilik ve üretimde gerçekleşen ölçek ekonomilerinden kaynaklanmaktadır (Fontagne ve Freudenberg, 2007). Uluslararası ticarette ülkeler, karşılaştırmalı üstünlük yolu ile edinilen kazançların üzerinde gelir elde edilmesini EİT yolu ile sağlarlar. Bunun nedeni EİT ile ülkeler farklı piyasalara geniş kapsamlı bir biçimde nüfuz etme şansı elde ederler.

Eşzamanlı olarak ihracat ve aynı sektörde gruplandırılmış aramalı ithalatı olarak da tanımlanan endüstri içi ticaret (EİT) kavramının önemi sürekli olarak dünya ticaretinde artmaktadır. EİT teorisinin oluşmasını sağlayan çalışmaları yapan Grubel ve Lloyd (1971) ile birlikte Krugman (1981) ve Helpman (1981)'ın yaptığı çalışmalarda konunun temellerinin oluşmasını sağlamıştır. Bunun yanında birçok diğer uluslararası iktisadın öncüleri de teoriye önemli katkıda bulunmuştur.

Grubel ve Lloyd (1985), EIT kavramını şu şekilde tanımlamıştır; Üretimdeki faktör yoğunlukları bakımından aynı veya benzer ürünlerin ihraç ve ithal edilmesine veya talep bakımından birbirine yakın ikame olan benzer malların iki yönlü ticaretine EİT denilmektedir. Daha genel bir ifadeyle EİT, talep ve arz bakımından birbirine yakın tüm malların ülkeler arasında ihraç ve ithal edilmesine denir. Krugman ise EİT'nin temelinde ölçek ekonomilerinin yattığını; bunun da bir endüstri içinde farklı ürünlerin üretilmesine yol açarak uzmanlaşma ve dış ticareti artırdığını ifade etmiştir (Krugman, 1981).

OECD (2002) nin yaptığı tanımda ise EİT kavramı iki farklı ticaret tanımı yapılarak açıklanmıştır. Bunlardan birincisi; monopollü rekabet piyasalarında her bir üreticinin benzer özellikteki ürünlerini farklılaştırma yoluna giderek pazarlanması yatay ticaret (aynı sınıfta yer alan binek otomobil pazarı) olarak tanımlanabilir. İkincisi ise kalite ve fiyat farklılıklarından kaynaklanan endüstri içi uzmanlaşma ile gelişen dikey olarak farklılaştırılmış benzer ürünlerin pazarlanması ise dikey ticaret olarak tanımlanmaktadır. Bu tanımda, homojen mallarda ortaya çıkabilecek ve/veya geleneksel teorilerle açıklanabilecek EİT olgusunun ihmal edildiği göze çarpmaktadır.

EİT konusu üzerine yapılan çalışmalarda elde edilen verilere göre dikey tarzda EİT kavramı genel olarak gelişmiş ülkeler ile gelişmekte olan ülkeler (Kuzey-Güney) arasındaki uluslararası ticareti açıklamada kullanılan bir durum olmasının yanında, yatay biçimde EİT kavramı ise daha çok gelişmiş ülkeler arasındaki (Kuzey-Kuzey) uluslararası ticareti açıklamak için kullanılmaktadır. Gelişmiş ülkeler ile gelişmekte olan ülkeler arasında DEİT'nin fazla olması beklenen bir durumdur. Gelişmekte olan ülkelerin teknoloji transferini sağlamak için doğrudan yabancı yatırımları ülkelerine çekmeleri ve bu yolla pozitif dışsallıklar meydana getirerek ekonomik büyümelerini sağlamaları beklenmektedir (Ertekin, 2007)

Dünya ticaret sisteminin globalleşmesi sonucunda üretim süreçlerinin bölümlere ayrılarak yerel avantajlardan faydalanma olanaklarının doğması ile birlikte farklı üretim aşamalarında bulunan bir sektördeki malların eşanlı olarak ihraç ve ithali olarak kabul edilen DEİT gelişmeye başlamıştır. Çokuluslu şirketlerin üretim süreçlerini farklı ülkelere bölmesi, DEİT'nin gelişmesinde en önemli sebep olarak görülmektedir. Otomotiv sektöründe olduğu gibi DEİT'nin söz konusu olduğu sektörlerde, teknoloji yoğun üretim gelişmiş ülkelerde yapılırken, emek yoğun üretim gelişmekte olan ülkelerde yapılmaktadır (Ertekin, 2007).

DYY'lar ile EİT arasındaki ilişkilerin varlığını ele alan oldukça sınırlı bir ampirik literatür, 2000'li yıllardan sonra belirginleşmeye başlamıştır. Dolayısıyla DYY'lar ile EİT arasındaki ilişkiler, farklı ekonometrik yöntemler eşliğinde farklı ülkeler ve dönemler için test edilmeye açık oldukça bakir bir alandır. Konu ile ilgili ampirik literatür Tablo 1'de özet bir şekilde verilmiştir.

Tablo 1'de özetlenen ampirik bulgulara göre DYY'lar ile EİT arasında evrensel bir bulgudan bahsetmek mümkün değildir. Daha açık bir ifadeyle çalışmaların büyük bir kısmı, DYY'ların EİT'i olumlu yönde etkileyen önemli bir determinant olduğuna işaret ederken, çalışmaların az bir kısmı ise DYY'ların EİT'i olumsuz yönde etkilediğini ve/veya hiç etkilemediğini bulmuşlardır. Konu ile literatürde farklılaşan bulguların altında ele alınan ülke ve dönem farklılıkları, kullanılan ekonometrik yöntem farklılıkları ve EİT'in dikey ve yatay olmasındaki farklılıklardan kaynaklanmaktadır. Konu ile ilgili ampirik literatürde Türkiye üzerine yapılmış herhangi bir çalışmaya rastlanılmamıştır. Dolayısıyla bu çalışmada DYY'lar ile EİT arası ilişkiler, Türkiye örneğinde de test edilmeye ihtiyaç duymaktadır.

**Not:** (+) iki değişken arasındaki pozitif ve istatistiki olarak anlamlı ilişkiyi; (-) iki değişken arasındaki negatif ve istatistiki olarak anlamlı ilişkiyi ve (0) iki değişken arasındaki istatistiki olarak anlamlı bir ilişki olmadığı göstermektedir.

*Tablo 1: EİT ve DYY'lar Arası İlişkiler Üzerine Ampirik Literatür*

## 3 Veri ve Metodoloji

Çalışmada EİT ve DYY arası ilişkiler, Türkiye'de "Ulaşım Araçları" alt sektörü örneğinde 2006:01-2013:11 dönemi için ele alınacaktır. Çalışma döneminin 2006-2013 olarak aylık veriler alınmasının temel nedeni, DYY'ların sektörel dağılımlarına ilişkin verilerin bu tarihler arasında mevcut olmasıdır. Çalışmada ulaştırma sektörüne ait DYY'lar ile ihracat ve ithalat verileri, Türkiye Cumhuriyet Merkez Bankası (TCMB) ile Türkiye İstatistik Kurumu (TUİK)'nun resmi internet sayfasındaki veri tabanlarından elde edilmiştir.

Çalışmada öncelikle ulaştırma sektöründeki EİT değerlerinin hesaplamasında farklı yöntem ve indekslerin literatürde mevcut olmasına rağmen Grubel ve Lloyd (1971) tarafından geliştirilen indeks kullanılmıştır. Grubel-Lloyd İndeksi (GLI) aşağıdaki şekilde formüle edilir:

$$GLI = 1 - \frac{|Xj - Mj|}{|Xj + Mj|} \qquad (1)$$

Burada, GLI; ülkenin j ürünündeki endüstri-içi ticaret endeks değerini temsil ederken, Xj verisi ülkenin j ürünündeki ihracat değerini, Mj ise ülkenin j ürünündeki ithalat değerini göstermektedir. GLI değeri 0'a yakınlaştıkça söz konusu sektörde endüstriler arası ticaretin yapıldığına; indeks değeri 1'e yaklaştığında ise ilgili sektörde endüstri-içi ticaret yapıldığına yorumlanmaktadır. Dolayısıyla indeks değerinin büyümesi endüstri içi ticaretin arttığına işaret etmektedir.

Türkiye'nin ulaşım araçları alt sektörü için DYY ile bu sektördeki EİT değişkenleri arası ilişkiler, Granger nedensellik testleri ile analiz edilecektir. Granger nedensellik testleri için aşağıdaki eşitlikler kullanılmıştır.

$$DYY_t = \alpha_0 + \sum_{i=1}^{m} \alpha_i DYY_{t-i} + \sum_{i=1}^{m} \beta_i EIT_{t-i} + \varepsilon_t \qquad (2)$$

$$E I T_t = \alpha_0 + \sum_{i=1}^{m} \alpha_i E I T_{t-i} + \sum_{i=1}^{m} \beta_i D Y Y_{t-i} + \varepsilon_t \qquad (3)$$

Yukarıdaki eşitliklerde t zamanı, $\alpha$ ve $\beta$ parametre katsayılarını, $m$ gecikme uzunluğunu, $\varepsilon$ ise hata terimini vermektedir.

### 3.1 Tanımlayıcı İstatistikler ve Durağanlık Sınama Sonuçları

Çalışmada ele alınan DYY'lar ile EİT değişkenlerine ait tanımlayıcı istatistikler Tablo 2'de verilmiştir.

|  | DYY | EİT |
|---|---|---|
| Ortalama | 8.400 | 87.889 |
| Medyan | 4.000 | 89.500 |
| Maksimum | 173.000 | 98.900 |
| Minimum | 1.000 | 63.200 |
| Standart Sapma | 18.526 | 8.499 |
| Gözlem Sayısı | 95 | 95 |

*Tablo 2. Tanımlayıcı İstatistikler*

Tablo 2'deki verilere göre 2006-2013 döneminde ulaştırma araçları sektörüne aylık ortalama 8.4 Milyon $'lık bir yabancı yatırım girişi olmuştur. Bununla birlikte 2009 yılının 8. ayında ulaştırma araçları sektörüne 173 Milyon $ ile en yüksek düzeyde doğrudan yabancı yatırımı gerçekleşmişken, birçok ayda 1 Milyon $ doğrudan yabancı sermaye girişi en düşük seviyede olacak şekilde yaşanmıştır. Diğer taraftan DYY'lar serisine ait standart sapmanın 18.5 Milyon $ gibi yüksek bir seviyede olması, ulaştırma sektöründe yaşanan DYY'ların oldukça istikrarsız bir yapıda olduğuna işaret etmektedir.

Çalışmada ele alınan değişkenlere ait veriler aylık olduğu için söz konusu serilerin mevsimsel özellikleri nedeniyle mevsimsellikten arındırılması gerekmektedir. Census X12 yöntemi ile mevsimsellikten arındırılmış serilerin durağanlık sınama sonuçları Tablo 3'de verilmiştir.

|  | DYY | | EİT | |
|---|---|---|---|---|
|  | t-Statistic | Olasılık | t-Statistic | Olasılık |
| Kritik Değerler | -10.152 | 0.000 | -7.595 | 0.000 |
| 1% level | -4.059 | | -4.059 | |
| 5% level | -3.458 | | -3.458 | |
| 10% level | -3.155 | | -3.155 | |

*Tablo 3. Değişkenlere Ait Augmented Dickey-Fuller (ADF) Birim-Kök Test Sonuçları (Trendli ve Sabitli)*

Tablo 3'deki ADF birim kök sınama sonuçlarına göre her iki değişken de seviye değerlerinde durağandırlar.

### 3.2 Granger Nedensellik Sonuçları

Çalışmada Türkiye'nin ulaştırma sektöründeki DYY girişleri ile bu sektördeki EİT arası ilişkiler Granger nedensellik testi ile inceleme konusu yapılmıştır. Eşitlik (2) ve (3)'ün tahminlerinden elde edilen bağımsız değişken katsayılarına uygulanan Wald testi sonuçlarına göre değişkenler arası nedensellik bulguları Tablo 4'de verilmiştir.

| Boş Hipotezi | F İstatistiği | Olasılık | Gecikme Uzunluğu (m) | Gözlem Sayısı |
|---|---|---|---|---|
| EİT, DYY'ların Bir Nedeni Değildir | 0.53914 | 0.5852 | 2 | 93 |
| DYY, EİT'in Bir Nedeni Değildir | 2.98292 | 0.0558 |  |  |
| EİT, DYY'ların Bir Nedeni Değildir | 1.94170 | 0.1290 | 3 | 92 |
| DYY, EİT'in Bir Nedeni Değildir | 4.28428 | 0.0073 |  |  |
| EİT, DYY'ların Bir Nedeni Değildir | 1.56362 | 0.1918 | 4 | 91 |
| DYY, EİT'in Bir Nedeni Değildir | 3.61210 | 0.0092 |  |  |

*Tablo 4. Ulaştırma Sektöründeki EİT ve DYY'lar Arası Nedensel İlişkiler*

Tablo 4'deki bulgulara göre gecikme uzunluğunun 2, 3 ve 4 olarak belirlendiği her bir durumda ulaştırma sektöründeki DYY'lardan ulaştırma sektöründeki EİT'e doğru tek yönlü bir nedensellik söz konusudur. Daha açık bir ifadeyle Türkiye ekonomisinde ulaştırma araçları sektöründe gerçekleştirilen yabancı yatırımlar, ulaştırma araçları sektöründeki endüstri içi ticaretin önemli bir nedenidir. Ulaştırma araçları sektöründeki DYY'lardan endüstri içi ticarete doğru tek yönlü nedensellik ilişkisinin kuvveti gecikme uzunluğuna bağlı olarak değişmektedir. Tablo4'deki bulgularda DYY'lardan endüstri içi ticaret üzerindeki istatistiki açıdan en büyük etki, gecikme uzunluğunun 3 olarak belirlendiği durumda yaşanmaktadır.

## 4   Sonuç ve Değerlendirme

Son yıllarda ülkelerin dış ticaret yapılarında ve ülkeler arası sermaye hareketlerinde önemli değişimler ve gelişmeler yaşanmıştır. Bu anlamda ülkeler arası ticaret aynı türden malların alınıp-satıldığı endüstri-içi ticaret ağırlıklı bir yapıya doğru evirilmeye başlamıştır. Aynı şekilde ülkelerin sermaye hareketlerine karşı daha açık olmalarını sağlayan finansal liberalizasyon ise ülkelerdeki doğrudan yabancı yatırımların önemini giderek artırmıştır. DYY'ların ülkelerin başta ekonomik büyümeleri, istihdam düzeyi, ücret seviyesi, ihracat ve ithalatı ve dolayısıyla ödemeler bilançosu üzerinde önemli etkileri ortaya çıkarması mümkündür. Bu çalışmada literatürde yeni yeni belirginleşmeye başlayan DYY'lar ile endüstri-içi ticaret arası ilişkiler ele alınmıştır.

Çalışmada Türkiye'nin en önemli ihracat sektörü olan Mortolu Taşıtlar ve Römorklarını da kapsayan ulaştırma araçları sektöründeki DYY'lar ile EİT arası ilişkiler Granger nedensellik testi ile araştırılmıştır. Çalışmadan elde edilen bulgular, ulaştırma araçları sektöründe yapılan DYY'lar'dan bu sektördeki EİT'e doğru tek yönlü bir nedenselliğe işaret etmektedir. Dolayısıyla çalışmadan elde edilen bulgulara göre Türkiye'nin ulaştırma araçları sektöründeki endüstri-içi ticaretin önemli bir nedeni, bu sektörde yapılan DYY'lardır.

Sonuç olarak 1980'li yıllardan sonra önemli ticari ve finansal liberalizasyonu gerçekleştiren Türkiye ekonomisinde ulaştırma araçları sektörü son yıllarda en önemli ihracat geliri sağlayan sektör konumuna gelmiştir. Bununla birlikte Türkiye'nin ulaştırma araçları sektöründeki ihracatının büyük bir kısmı DYY'lar vasıtasıyla Türkiye'de faaliyet gösteren yabancı firmalar tarafından gerçekleştirilmektedir. Dolayısıyla ulaşım sektöründeki endüstri içi ticaret ağırlıklı bir yapının yaşanmasında DYY'ların etkisi önemlidir.

# Balkan Ülkelerine ve Türkiye'ye Yönelik Doğrudan Yabancı Sermaye Girişlerinde Ekonomik Özgürlüklerin Belirleyiciliği

# The Determination of Economic Freedom in Foreign Direct Investment Inflows to the Balkans States and Turkey

Prof. Dr. Bedriye Tunçsiper (Balıkesir University, Turkey)

Ph.D. Candidate Ömer Faruk Biçen (Balıkesir University, Turkey)

## Abstract

Foreign direct investment (FDI) are an important external savings resource for the developing countries that have problems with financing of growth and development. The transformation that started in the global economic system from 1980's substituted other capital types, major of them are FDI, instead of official development aid. Nevertheless, the foreign direct investment pulling competition have started among developing countries. The papers in this side imply that the countries having broad domestic markets, high economic growth potential, an improved infrastructure and human capital level have advantages on pulling FDI. Moreover, some papers in last years reflect that economic freedom is also an important determinative in addition to other determinatives of FDI. The main aim of this paper is to analyze the determination of economic freedom on the FDI that inflow to the Balkan states and Turkey. In the paper using 1994-2012 time dimension, the countries added to the analysis are Turkey, Bulgaria, Greece, Romania, Macedonia, Albania and Croatia. The results with panel regression method showed that some economic freedom indices supported the inflows of FDI in this countries.

## 1 Giriş

Küresel ekonomide 1980 sonrasında başlayan dönüşüm süreci, ekonomik ve ekonomik olmayan pek çok alanda ülkeler arasındaki sınırlamaları en alt düzeye indirerek, ülkelerin entegrasyon düzeyini arttırmıştır. İkinci dünya savaşı sonrasındaki siyasal temelli ekonomik bağımlılık, yerini büyük ölçüde ekonomik alandaki işbirliğine dönüştürmüştür. Gelişmiş ve gelişmekte olan ülkeler arasındaki sermaye akımlarında da benzer olgular gözlenmektedir. 1980'li yıllardan önce gelişmiş ve gelişmekte olan ülkeler arasındaki "resmi kalkınma yardımları"na bağlı ekonomik ilişkiler, 1980'li yıllarla birlikte yerini büyük ölçüde doğrudan yabancı sermaye yatırımları ve portföy yatırımları gibi arka planında daha çok ekonomik kriterlerin olduğu sermaye akımlarına bırakmıştır. 1990'dan itibaren bunlara sıcak para girişleri de eklenmiştir.

Gelişmekte olan ülkeler, ekonomik kalkınmayı gerçekleştirme, gelişmiş ülkelerle arasındaki gelişmişlik farklarını kapatma ve makro ekonomik istikrarı sağlama vb. amaçlarla yoğun biçimde sermayeye ihtiyaç duymaktadırlar. Bu sermayenin ülke içerisinde sağlanamadığı durumlarda, yurt dışı kaynakları ülkeye çekmek büyük önem taşımaktadır. Ancak, bahsedilen hedeflere ulaşmak uzun vadeli yatırımları gerektirdiği için, "resmi kalkınma yardımları"nı ikame edici sağlam kaynaklara gereksinim duyulmaktadır. 1980 sonrasında bu görevi "doğrudan yabancı sermaye" üstlenmiştir. Bir şirketin, yerleşik olduğu ülke dışındaki ülkelerde üretim tesisi kurması veya o ülkelerde mevcut üretim tesisini alması doğrudan yabancı yatırım olarak tanımlanmaktadır (Seyidoğlu, 2007). Yine Salvatore (2011)'a göre; yabancı ülkedeki bir firma hisselerinin % 10'unun veya daha fazlasının satın alınması doğrudan yabancı yatırım olarak tanımlanmaktadır. Doğrudan yabancı sermaye; portföy yatırımı ve sıcak para gibi ekonomik veya siyasi bir istikrarsızlık durumunda ülkeyi hemen terk edemediği için gelişmekte olan ülkeler tarafından en çok tercih edilen dış kaynak türüdür.

Dış kaynak elde etmek isteyen ülkeler, elde edecekleri dış kaynakları borçlanma veya portföy yatırımı şeklinde de elde edebilmektedirler. Ancak, doğrudan yabancı yatırımlar yabancı fon girişi sağlamanın yanında ev sahibi ülkeler için ek imkanlar da sunmaktadır. Bunların arasında en önemlileri ise ülkenin teknoloji düzeyini ilerletme, yönetim bilgisi ve ticari sırların transferi, istihdam artışı sağlama, ülkenin iç piyasasını genişletme, ulaşım ve haberleşme alt yapısını geliştirme, hammaddelerin etkin dağılımını gerçekleştirme, beşeri sermaye düzeyini yükseltme ve bu faktörlerin sonucu olarak ta ekonomik gelişmeye yol açmasıdır (Yılgör, vd., 2011; Asiedu, 2002; Bengoa ve Sanchez-Robles, 2003; De Castro, 2013). Bu üstünlükleri dolayısıyla gelişmekte olan ülkeler arasında doğrudan yabancı sermayeyi çekme yarışı başlamıştır. Doğrudan yabancı sermayenin ise bir ülkeyi tercih etmesinde belirli faktörler söz konusudur. Bu faktörlerin arasında en önemli olanı, doğrudan yabancı sermaye yatırımı sonucunda elde edilecek getiri düzeyidir. Ancak, getiri düzeyinin yanında doğrudan yabancı sermaye girişlerini belirleyen, teorik ve ampirik çalışmalarda da yer alan çok sayıda değişken bulunmaktadır. Günümüzde, ülkelerin ekonomik özgürlük düzeyinin endeksler yardımıyla ölçülebilmesi, doğrudan yabancı sermaye girişlerinde ekonomik özgürlüklerin de belirleyiciliğini araştıran çalışmaların sayıca artmasına yol açmıştır.

Çalışmanın temel amacı, Türkiye'nin de dahil edildiği bazı Balkan ülkelerinde 1994-2012 yılları arasında doğrudan yabancı sermaye yatırımlarının diğer belirleyicileri yanında, ekonomik özgürlüklerin de doğrudan yabancı sermaye girişlerindeki belirleyiciliğini analiz etmektir. Çalışmanın planı da bu amaca uygun bir şekilde oluşturulmuş ve girişi takip eden ikinci bölümde, araştırmanın kapsamı, araştırma kapsamında kullanılan değişkenler ve literatür bilgisine yer verilmiştir. Üçüncü bölüm, çalışmada kullanılacak ampirik model, yöntem ve veri setine ayrılmış olup, dördüncü ve son bölümde ise ampirik model sonucunda elde edilen bulguların sonuçları ve değerlendirilmesine ayrılmıştır.

## 2 Araştırmanın Kapsamı, Araştırma Kapsamında Kullanılan Değişkenler ve Literatür Özeti

Çalışmanın bu kısmında, araştırmanın amacı, kapsamı, analize dahil edilen ülkeler, bu ülkelere yönelik doğrudan yabancı sermaye girişleri, ampirik modelde kullanılacak değişkenler ve konuyla ilgili daha önce yapılan çalışmalara ilişkin bilgiler sunulmaktadır. Analize dahil edilen ülkelerin tümü Balkan ülkeleri olup, literatürde yer alan çalışmaların bazılarında bu ülkelere de yer verilmiştir. Ancak, uluslararası alanda Balkan ülkeleri temelinde konuyu inceleyen bir çalışmanın bulunmadığı da gözlenmiştir. Dolayısıyla çalışmanın bir amacı da, literatürdeki bu eksikliğin giderilmesidir.

### 2.1 Araştırmanın Amacı, Kapsamı ve Araştırmaya Dahil Edilen Ülkeler

Araştırma, giriş bölümünde de kısaca bahsedildiği gibi 1994-2012 yılları arasında Türkiye'nin de aralarında bulunduğu yedi Balkan ülkesine yönelik doğrudan yabancı sermaye girişlerinde, ekonomik özgürlüklerin belirleyiciliğini analiz etmeyi amaçlamaktadır. Ekonomik özgürlükler, Amerika Birleşik Devletleri'nde faaliyet gösteren Heritage Vakfı (Heritage Foundation) ve Wall Street Journal tarafından ortaklaşa hazırlanan Ekonomik Özgürlükler Endeksi (IEF) ve Kanada'da faaliyet gösteren Fraser Enstitüsü tarafından hazırlanan Dünya Ekonomik Özgürlüğü Endeksi (EFW) aracılığıyla genel endeks ve alt endeksler yardımıyla ölçülebilmektedir. Ekonomik özgürlüklerin endeksler yardımıyla ölçülebilmesi, özellikle 2000'li yıllarda doğrudan yabancı sermaye girişlerinde ekonomik özgürlüklerin belirleyiciliğini inceleyen çalışmaların sayısının da artmasına yol açmıştır. Özellikle, Bengoa ve Sanchez-Robles (2003), Kapuria-Foreman (2007) ve Quazi (2007) tarafından yapılan ampirik çalışmalar, yapılan bu çalışmaya da temel oluşturmuştur.

Araştırmaya yedi Balkan ülkesi dahil edilmiştir. Bu ülkeler, Türkiye, Bulgaristan, Yunanistan, Romanya, Makedonya, Arnavutluk ve Hırvatistan'dır. Diğer Balkan ülkelerine ilişkin yeterli veri bulunamaması bu ülkelerin analiz dışı bırakılmasına yol açmıştır.

### 2.2 Araştırmaya Dahil Edilen Ülkelere Yönelik Doğrudan Yabancı Sermaye Girişleri

Gelişmekte olan ülkelerin ekonomik gelişme yolunda karşılaştıkları yapısal darboğazlar ve bunun hem nedeni hem de sonucu olan sermaye birikimi yetersizliğinin giderilmesinde en etkin yol dış finansmandır (Yılgör vd., 2011). Dış finansman türleri arasında da doğrudan yabancı sermaye yatırımları diğer fon akımlarına göre belirli üstünlüklere sahiptir. Çünkü doğrudan yabancı yatırımlar gelişmekte olan ülkelerde yatırım için ihtiyaç duyulan fonları sağlama yoluyla yatırım açığının, döviz açığının ve ekonomik aktiviteyi geliştirerek vergi gelirleri açığının kapanmasında önemli roller üstlenmektedir (Smith, 1997; Quazi, 2007).

Doğrudan yabancı sermaye bir ülkeye belirli amaçlarla girmektedir. Bu amaçlardan en önemlileri ise, kaynak arayışı ve yeni piyasa arayışıdır. Kaynak (hammadde) arayışında olan doğrudan yabancı sermaye "dikey doğrudan yabancı sermaye", piyasa arayışında olan doğrudan yabancı sermaye ise "yatay doğrudan yabancı sermaye" olarak ifade edilmektedir. Bunun yanında bazı doğrudan yabancı yatırım türleri, kaynak arayışı ve piyasa arayışın yanında etkinlik arayışı ve stratejik varlık arayışı gibi nedenlerle de belirli ülkelerde yatırım faaliyetinde bulunabilmektedir (Özcan ve Arı, 2010; De Castro, 2013).

Doğrudan yabancı sermayenin yukarıda belirtilen amaçları, bu tür yatırımların amaçlarına en iyi şekilde ulaşılabileceği ülkeleri tercih etmesinde büyük bir rol oynamaktadır. 2013 yılı OECD verileri incelendiğinde, 2012 yılında doğrudan yabancı sermayenin en çok tercih ettiği ülkeler 253 milyar $ ile Çin, 166 milyar $ ile ABD ve 65 milyar $ ile Brezilya'dır (OECD, FDI in Figures, October 2013). Bu üç ülkenin nüfus miktarı fazla olup, iç piyasa hacmi geniştir. Aynı zamanda Çin'de işgücünün ucuz olması, 1990'lı yıllardan itibaren doğrudan yabancı sermayenin bu ülkeyi tercih etmesinde önemli bir etkendir. Brezilya da, yüksek gelişme hızı ve sahip olduğu kaynaklar açısından önemli bir potansiyele sahiptir.

Çalışmaya dahil edilen yedi Balkan ülkesi incelendiğinde ise, bu ülkelere yönelik doğrudan yabancı sermaye girişlerinin düşük olduğu görülmektedir. Ancak Şekil 1 incelendiğinde, 1980-2000 döneminde Balkan ülkelerine giren doğrudan yabancı sermaye miktarı yatay bir seyir izlerken, 2000 yılından sonra özellikle Türkiye, Bulgaristan, Romanya ve Hırvatistan'a yönelik doğrudan yabancı sermaye miktarında ciddi bir artış olduğu görülmektedir.
**Şekil 1.** *1980-2012 Döneminde Yedi Balkan Ülkesine Yönelik Doğrudan Yabancı Sermaye Girişleri (ABD Doları)* **Kaynak:** *The World Bank Data, 2014*

Yunanistan hariç tutulduğunda bu ülkeler, Avrupa Birliği (AB) ile müzakere sürecinde olan ya da Avrupa Birliğine tam üye olan ülkelerdir. Türkiye, AB ile 2005 yılından itibaren müzakere sürecindedir. Romanya ve Bulgaristan 2007 yılında, Hırvatistan ise 2013 yılında AB'ye tam üye olmuşlardır. Buna göre Şekil 1 incelendiğinde, Bevan ve Estrin (2004)'in çalışmalarında belirttikleri; "AB üyeliği doğrudan yabancı sermaye girişlerinde belirleyici bir faktör olabilir" ifadesi doğrulanmış olmaktadır. Benzer bir sonuca Tintin (2013)'in çalışmasında da ulaşılmıştır. Buna göre; ülkenin AB üyeliği ile Doğrudan Yabancı Sermaye girişleri arasında pozitif ve anlamlı bir ilişki vardır. Ek olarak özellikle, 2000 yılı sonrasında (2008 Küresel Finans Krizine kadar olan süreçte) küresel piyasalardaki fon fazlasının da bu ülkelere yönelik doğrudan yabancı sermaye akımlarının artmasında önemli bir faktör olduğu belirtilmelidir.

| Ülkeler | 1980 | 1985 | 1990 | 1995 | 2000 | 2005 | 2010 | 2012 |
|---|---|---|---|---|---|---|---|---|
| **Türkiye** | 18.000.000 (0,03) | 99.000.000 (0,17) | 684.000.000 (0,34) | 885.000.000 (0,27) | 982.000.000 (0,07) | 10.031.000.000 (0,75) | 9.036.000.000 (0,60) | 12.519.000.000 (0,83) |
| **Bulgaristan** | | | 4.000.000 (0,002) | 90.400.000 (0,02) | 1.001.503.841 (0,07) | 4.098.122.930 (0,30) | 1.866.586.151 (0,12) | 2.094.803.207 (0,13) |
| **Yunanistan** | 672.000.000 (1,30) | 447.000.000 (0,80) | 1.005.000.000 (0,51) | 1.053.000.000 (0,33) | 1.083.400.000 (0,08) | 689.960.219 (0,51) | 533.530.144 (0,03) | 1.663.327.172 (0,11) |
| **Romanya** | | | | 419.000.000 (0,13) | 1.037.000.000 (0,07) | 6.866.410.000 (0,51) | 3.204.000.000 (0,21) | 2.024.000.000 (0,13) |
| **Makedonya** | | | | 9.490.000 (0,002) | 215.056.603 (0,02) | 145.329.601 (0,01) | 300.734.840 (0,02) | 282.676.631 (0,02) |
| **Arnavutluk** | | | | 70.000.000 (0,02) | 143.000.000 (0,01) | 262.479.012 (0,02) | 1.089.416.366 (0,07) | 1.265.256.715 (0,08) |
| **Hırvatistan** | | | | 108.053.139 (0,03) | 1.109.936.497 (0,08) | 1.777.125.380 (0,13) | 786.842.085 (0,05) | 1.395.251.518 (0,09) |
| **Dünya** | 51.461.516.296 | 55.831.432.506 | 196.279.702.863 | 319.884.615.104 | 1.319.336.308.892 | 1.328.056.014.674 | 1.485.609.777.431 | 1.509.564.966.228 |

**Tablo 1.** *1980-2012 Döneminde Yedi Balkan Ülkesine Yönelik Doğrudan Yabancı Sermaye Girişleri (ABD Doları) ve Dünyadaki Payı (%)* **Kaynak:** *The World Bank Data, 2014*

Şekil 1'e paralel olarak Tablo 1 de, Dünya Bankası verilerinden hareketle 1980-2012 yılları arasındaki belirli yıllarda çalışmaya dahil edilen yedi Balkan ülkesine yönelik doğrudan yabancı sermaye girişlerini (ABD doları cinsinden) özetlemektedir. 1995 yılına kadar sadece Türkiye ve Yunanistan'a ilişkin veriler bulunmaktadır. 1995 yılından 2012 yılına kadar tüm ülkeler yıllık doğrudan yabancı sermaye girişlerini arttırmıştır. Türkiye'ye yönelik doğrudan yabancı sermaye girişlerinin 2005 yılından itibaren diğer ülkelerle kıyaslandığında ciddi bir üstünlüğü bulunmaktadır. Yapılan özelleştirmelerle birlikte 2006 ve 2007 yıllarında Türkiye'ye giren doğrudan yabancı sermaye tutarı yıllık 20 milyar $'ın üzerine çıkmıştır (The World Bank Data, 2014). Tablo 1'de parantez içinde verilen değerler ise, ilgili ülkeye giren doğrudan yabancı sermaye miktarının dünyadaki toplam doğrudan yabancı sermaye akımı içerisindeki payını göstermektedir. 2012 yılında Türkiye'ye 12,5 milyar $ düzeyinde doğrudan yabancı sermaye girişi olmuştur ve bunun dünyadaki toplam doğrudan yabancı sermaye akımları içerisindeki payı ise yalnızca % 0,83'tür. Türkiye'nin ardından yaklaşık 2 milyar $'lık doğrudan yabancı sermaye girişiyle Bulgaristan ve Romanya, Türkiye'yi izlemektedir. Çalışmaya dahil edilen yedi ülkeye yönelik toplam doğrudan yabancı sermaye girişlerinin dünyadaki doğrudan yabancı sermaye miktarına oranı ise 1995 yılında %

0,82 iken, 2000 yılında % 0,42'ye düşmüştür. Fakat, 2012 yılında bu oran tekrar yükselerek % 1,40 düzeyine ulaşmıştır.

Araştırma Kapsamında Kullanılacak Değişkenlere İlişkin Bilgiler ve Literatür Özeti

Çalışmada, doğrudan yabancı sermaye girişlerini belirlemede on farklı değişkenden yararlanılmaktadır. Ekonomik özgürlük düzeyini ifade eden beş değişkenin yanında, literatürde yer alan çalışmalardan derlenen beş adet kontrol değişken de yer almaktadır. Buna göre;

*Piyasa hacmi,* literatürdeki çalışmalar incelendiğinde doğrudan yabancı sermaye girişlerini belirleyen en önemli değişkenlerden birisidir. Piyasa hacmi, Gayrisafi Yurtiçi Hasıla (GSYİH), Kişi Başına Düşen Gayrisafi Mili Hasıla veya bu değişkenlerin logaritmik ifadesiyle ölçülmektedir. Çalışmada piyasa hacmi, reel GSYİH büyüklüğüyle gösterilmiştir. Tablo 2'de de görüldüğü gibi, literatürde yer alan çalışmalara göre piyasa hacmi ile doğrudan yabancı sermaye girişleri arasında pozitif ve anlamlı bir ilişki bulunmaktadır.

| DYY'nin Belirleyicileri | Pozitif | Negatif | Anlamsız | Nedensellik |
|---|---|---|---|---|
| **Piyasa Hacmi** | Resmini (2000)<br>Chakrabarti (2001)<br>Bevan ve Estrin (2004)<br>Janicki ve Wunnava (2004)<br>Quazi (2007)<br>Ang (2008)<br>Kar ve Tatlısöz (2008)<br>Jadhav (2012)<br>De Castro vd. (2013) | | | Yılgör vd. (2011)<br>DYY ↔ Piyasa Hacmi |
| **Dışa Açıklık** | Resmini (2000)<br>Chakrabarti (2001)<br>Asiedu (2002)<br>Bevan ve Estrin (2004)<br>Janicki ve Wunnava (2004)<br>Kar ve Tatlısöz (2008)<br>Jadhav (2012)<br>De Castro vd. (2013) | | | Yılgör vd. (2011)<br>DYY → Dışa Açıklık |
| **Ekonomik İstikrar** | Jadhav (2012) | | | |
| **Kamu Harcamaları** | Globerman ve Shapiro (2002)<br>Ang (2008) | | | |
| **Altyapı** | | | Asiedu (2002) | |

***Tablo 2.*** *Literatür Özeti*

*Dışa Açıklık,* ihracatın, ithalatın veya ihracat ve ithalat toplamının GSYİH'ya oranı olarak ifade edilmektedir. Bu oranın 100'e yaklaşması, ülkenin dışa açıklık düzeyinin yükseldiğini göstermektedir. Çalışmada dışa açıklık düzeyi, ihracat ve ithalat toplamının GSYİH'ya oranı olarak hesaplanmıştır. Tablo 2'de ülkelerin dışa açıklığı ile doğrudan yabancı sermaye girişleri arasında pozitif bir ilişki olduğu görülmektedir.

*Ekonomik İstikrar,* literatürde yer alan çalışmalarda enflasyon oranı ile gösterilmiş olup, çalışmada bu değişken ülkelerin yıllık Tüketici Fiyat Endeksi (TÜFE) ile ifade edilmiştir. Jadhav (2002)'a göre; enflasyon artışı doğrudan yabancı sermaye girişlerini pozitif yönde etkilemektedir.

*Kamu müdahalesi* de doğrudan yabancı sermaye girişlerini etkileyen bir diğer önemli değişkendir. Kamu müdahalesi değişkeni toplam vergi miktarı, toplam vergi miktarının GSYİH'ye oranı, kamu harcamaları veya kamu harcamalarının GSYİH'ya oranı olarak gösterilebilmektedir. Çalışmada kamu müdahale düzeyinin belirlenmesinde kamu harcamalarının GSYİH içerisindeki payından yararlanılmıştır. Kamu harcamaları ile doğrudan yabancı sermaye girişleri arasında Globerman ve Shapiro (2002) ve Ang (2008)'a göre pozitif bir ilişki bulunmaktadır.

*Altyapı* değişkeni ise, Asiedu (2002)'nun çalışmasında 1000 kişiye düşen telefon sayısı baz alınarak hesaplanmıştır. Ancak günümüzde internet kullanımının yaygınlaşması, ülkelerin altyapılarını buna göre geliştirmelerini gerekli kılmaktadır. Bu yüzden, altyapı düzeyini günümüzde daha anlamlı bir biçimde ifade edeceği için telefon sayısı yerine, 100 kişi başına düşen internet erişimi çalışmaya dahil edilmiştir. Asiedu (2002)'nun çalışmasında, altyapı ile doğrudan yabancı sermaye girişleri arasındaki ilişki anlamsız çıkmıştır.

Ekonomik özgürlüğe ilişkin değişkenler ise, Heritage Vakfı (Heritage Foundation) ve Wall Street Journal tarafından ortaklaşa hazırlanan Ekonomik Özgürlükler Endeksi (IEF)'nden hareketle derlenmiştir (The Heritage Foundation, 2014 Index of Economic Freedom). Çalışmada genel ekonomik özgürlük endeksinin yanında doğrudan yabancı sermaye girişlerini etkileyebilecek mülkiyet hakları endeksi, iş kurma özgürlüğü endeksi,

ticaret özgürlüğü endeksi ve yatırım yapma özgürlüğü endeksinden yararlanılmıştır. Son dönemlerde ekonomik özgürlükler ve politik özgürlükler gibi kurumsal faktörlerin de endeksler yardımıyla hesaplanabilmesi, doğrudan yabancı yatırımlarla birlikte diğer ekonomik değişkenlerin kurumsal faktörlerle ilişkisini analiz eden çalışmaların sayıca artmasına yol açmıştır. Doğrudan yabancı sermaye girişlerinin ekonomik özgürlükler başta olmak üzere diğer kurumsal faktörlerle ilişkisini inceleyen çalışmalardan bazılarına aşağıda değinilmiştir.

Savaşan ve Dursun, çalışmalarında 101 ülkeye ait Heritage Vakfı (Heritage Foundation) ve Wall Street Journal tarafından ortaklaşa hazırlanan Ekonomik Özgürlükler Endeksi (IEF) ve doğrudan yabancı yatırım verilerinden hareketle, ülke grupları arasında ekonomik özgürlükler puanı ve doğrudan yabancı yatırım ortalamalarının istatistiksel olarak farklı olup olmadığını araştırmışlardır. Çalışmada ulaşılan sonuçlara göre; ekonomik özgürlük puanı yüksek olan ülkeler, puanı düşük olan ülkelerle kıyaslandığında daha fazla doğrudan yabancı yatırım çekmektedirler.

Bengoa ve Sanchez-Robles (2003), 18 Latin Amerika ülkesinde 1970-1999 döneminde ekonomik özgürlükler, doğrudan yabancı yatırımlar ve büyüme arasındaki ilişkileri test etmişlerdir. Panel sabit etkiler ve tesadüfi etkiler modelinden elde edilen sonuçlara göre, ekonomik özgürlükler ve GSYİH, doğrudan yabancı yatırımların pozitif ve anlamlı bir belirleyicisi iken, aynı şekilde doğrudan yabancı yatırım ve ekonomik özgürlükler de ekonomik büyümenin pozitif ve anlamlı birer belirleyicisidir.

Kapuria-Foreman (2007), 81 gelişmekte olan ülkede ekonomik özgürlüklerin doğrudan yabancı yatırım girişleri üzerindeki etkisini incelemiştir. Elde edilen bulgular, doğrudan yabancı yatırım girişlerini belirlemede genel ekonomik özgürlük endeksi kullanıldığında sonuçlar istatistiksel olarak anlamsız çıkarken, alt ekonomik özgürlük endekslerinden mülkiyet haklarındaki artışlar ve hükümetin ekonomiye yönelik müdahaleleri ile sermaye girişleri ve doğrudan yabancı yatırım üzerindeki engellemelerde meydana gelen azalmalar doğrudan yabancı sermaye girişlerini arttırmaktadır.

Quazi (2007), 1995-2000 döneminde Çin, Endonezya, Güney Kore, Malezya, Filipinler, Singapur ve Tayland'da yapılan doğrudan yabancı yatırımların belirleyicilerini incelediği çalışmasında ekonomik özgürlükleri ifade eden değişkenin katsayısı negatif ve anlamsız olarak bulunmuştur. Çin hariç tutulup model tekrar kurulduğunda ise, ekonomik özgürlükleri ifade eden değişkenin katsayısı negatif ve anlamlı çıkmıştır. Buna göre, Endonezya, Güney Kore, Malezya, Filipinler, Singapur ve Tayland'da ekonomik özgürlük düzeyindeki ilerlemelerin doğrudan yabancı sermaye girişleri üzerinde caydırıcı bir etkisi bulunmaktadır.

Türen vd. (2011) tarafından yapılan çalışmada, 2002-2010 yılları arasında Türkiye'nin diğer ülkelere yapmış olduğu doğrudan yabancı yatırımların yaklaşık % 52'lik kısmının ekonomik özgürlükler tarafından açıklandığı, geriye kalan % 48'lik kısmının ise kültürel bağlara sahip olma, aynı dili konuşma vb. gibi diğer faktörler tarafından açıklandığı sonucuna ulaşılmıştır.

Tintin (2013), AB-15, ABD, Çin ve Japonya tarafından Bulgaristan, Hırvatistan, Çek Cumhuriyeti, Macaristan, Makedonya ve Polonya'ya yapılan doğrudan yabancı yatırımları belirleyen ekonomik ve kurumsal faktörleri analiz etmiştir. Elde edilen tahminlere göre, piyasa hacmi, dışa açıklık ve yatırım yapılan ülkenin AB üyeliği doğrudan yabancı yatırım yapmada (Japonya hariç) pozitif ve anlamlı ekonomik değişkenlerdir. Kurumsal faktörler incelendiğinde ise AB-15 için, ekonomik özgürlükler, ülke kırılganlığı, politik haklar değişkenlerinin katsayıları pozitif ve anlamlı çıkmıştır. ABD için, ülke kırılganlığı ve sivil haklar değişkenlerinin katsayıları negatif ve anlamlı, Çin için ise, ekonomik özgürlükler, ülke kırılganlığı ve sivil haklar değişkenlerinin katsayıları pozitif ve anlamlı bulunmuştur. Son olarak ta Japonya için, tüm kurumsal değişkenlerin katsayıları pozitif ve anlamlı çıkmıştır.

## 3 Model, Yöntem ve Veri Seti

Çalışmanın bu kısmında, 1994-2012 yılları arasında Türkiye, Bulgaristan, Yunanistan, Romanya, Makedonya, Arnavutluk ve Hırvatistan'a yönelik doğrudan yabancı sermaye girişleri ile genel ekonomik özgürlük endeksi ve ekonomik özgürlüğe ilişkin bazı alt endeksler arasındaki ilişkiler tahmin edilmeye çalışılacaktır. Tahmin edilecek modelin zaman ve birim boyutunun çok sayıda olması Panel Veri Yönteminin kullanılmasını gerekli kılmaktadır. Panel veri modelinin tahmininde ise Stata 11 paket programından yararlanılmıştır. Çalışmada tahmin edilecek model aşağıdaki gibidir.

$$FDI_{it} = \beta_0 + \beta_1 RGDP_{it} + \beta_2 OPEN_{it} + \beta_3 ESTA_{it} + \beta_4 GOV_{it} + \beta_5 INFR_{it} + \beta_6 GEFI_{it} +$$

$$\beta_7 PRI_{it} + \beta_8 BFI_{it} + \beta_9 TFI_{it} + \beta_{10} IFI_{it} + \varepsilon_{it} \quad (1) \qquad (i=1,\ldots,N; t=1,\ldots,T)$$

Yukarıdaki modelde i. ülkeye t döneminde giren Doğrudan Yabancı Sermaye ($FDI_{it}$) bağımlı değişken olarak alınmıştır. Modelin bağımsız değişkenleri ise ekonomik özgürlüğe ilişkin genel endeks ($GEFI_{it}$), ekonomik özgürlüğün alt endekslerinden mülkiyet hakları endeksi ($PRI_{it}$), çalışma/iş kurma özgürlüğü endeksi ($BFI_{it}$), ticaret özgürlüğü endeksi ($TFI_{it}$) ve yatırım yapma özgürlüğü endeksi ($IFI_{it}$)'dir. Diğer bağımsız değişkenlerden olan reel GSYİH ($RGDP_{it}$), dışa açıklık ($OPEN_{it}$), ekonomik istikrar ($ESTA_{it}$), kamu harcamaları/GSYİH oranı ($GOV_{it}$) ve altyapı düzeyi ($INFR_{it}$) ise literatürdeki diğer çalışmalarda da kullanılan kontrol değişkenleri ifade etmektedir. Hata terimi ise $\varepsilon_{it}$ ile temsil edilmiştir.

Genel ekonomik özgürlüğü ve ekonomik özgürlüğün alt kriterlerini ifade eden endeksler, Heritage Vakfı ve Wall Street Journal tarafından ortaklaşa hazırlanan Ekonomik Özgürlükler Endeksi (IEF)'ne ilişkin veri tabanı kullanılarak oluşturulmuştur. Reel GSYİH, Dışa Açıklık, Ekonomik İstikrar, Kamu Harcamaları/GSYİH ve altyapı düzeyine ilişkin veriler ise Dünya Bankası veri tabanından derlenmiştir (The World Bank Data, 2014).

Çalışmadaki verilere yönelik bazı kısıtlamalar da bulunmaktadır. Bu çerçevede, Yunanistan'a 1998 yılında gelen doğrudan yabancı sermaye miktarı Dünya Bankası veri tabanında bulunmadığı için, 1997 ve 1999 yıllarının ortalaması kullanılmıştır. Hırvatistan'ın ise 1994 yılı reel GSYİH, reel ihracat ve reel ithalat değerlerine ulaşılamadığı için 1995 yılı değerleri kullanılmış olup, aynı şekilde Hırvatistan'ın 1995 yılı ekonomik özgürlük endeks puanları da eksiktir. Bu eksiklik 1996 yılı verileri kullanılarak giderilmiştir. Son olarak ta, Makedonya'nın 1995-2002 yılları arasında ekonomik özgürlük verileri bulunmadığından, bu yıllara ilişkin veriler Polonya ve Macaristan referans alınarak oluşturulmuştur.

Verilerin oluşturulmasının ardından model tahminine geçmeden önce kullanılacak yöntem hakkında da bilgi verilmesi gerekmektedir. Daha öncede bahsedildiği gibi, çalışmanın birim ve zaman boyutunda çok sayıda gözlemi içermesi panel veri yönteminin uygulanmasını gerekli kılmaktadır. Panel veri modelleri; panel en küçük kareler (EKK), sabit etkiler veya tesadüfi etkiler yaklaşımlarına göre tahmin edilebilir. Bu yaklaşımlardan panel EKK, birime özel etkileri dikkate almamakta ve bu yüzden sınırlayıcı bir yaklaşım olarak kabul edilmektedir. Sabit etkiler yaklaşımında her bir birimin gözlemlenemeyen ve zaman içinde değişmeyen özellikleri olduğu varsayılmakta, tesadüfi etkiler yaklaşımında ise birimlerdeki gözlemlenemeyen etkilerin modeldeki bağımsız değişkenlerle ilişkisiz olduğu varsayılmaktadır. Fakat bu varsayımın ihlal edildiği durumlarda, tesadüfi etkiler yaklaşımı sapmalı ve tutarsız tahminlerde bulunmaktadır (Vergil ve Yıldırım, 2006; Vergil ve Karaca, 2010). Ekonometrik uygulamaların çoğunda, sabit etkiler ve tesadüfi etkiler tahmincilerinin arasında tercih yapmada Hausman Testi kullanılmaktadır (Baltagi vd, 2003). Bu çalışmada da Hausman testi her iki tahminci arasında karar vermede kullanılmıştır.

## 4   Ampirik Bulgular ve Değerlendirme

Model tahmininden önce aşağıdaki Tablo 3'te, modelde kullanılan değişkenlere ilişkin ortalama, standart sapma, minimum ve maksimum değerler ile gözlem sayısına ilişkin özet istatistiki bilgiler sunulmuştur.

Özet istatistiki bilgilere yer verildikten sonra kurulacak olan modelin birim ve/veya zaman etkilerinin olmadığı klasik modele, sabit etkiler modeline veya tesadüfi etkiler modeline uygun olup olmadığının belirlenmesi gerekmektedir. Bunun için öncelikle klasik model ile sabit etkiler ve tesadüfi etkiler modelleri arasında karar vermek için F testi yapılmıştır. Çalışmada doğrudan yabancı sermaye girişleri ile diğer değişkenler arasındaki ilişkinin belirlemesinde beş farklı model kullanılmış ve her bir modele ilişkin sabit etkiler modeli tahmin edilmiştir. Sabit etkiler modelinden elde edilen F istatistik değerleri F tablo değerleriyle karşılaştırılarak birim ve zaman etkilerinin var olup olmadığı sınanmıştır. Beş modelden elde edilen sonuçların tümü de birim etkilerin bulunduğuna işaret etmektedir (Bkz. Tablo 4). Yani klasik model geçerli değildir.

|  | FDI | RGDP | OPEN | ESTA | GOV | INFR | GEFI | PRI | BFI | TFI | IFI |
|---|---|---|---|---|---|---|---|---|---|---|---|
| **Ortalama** | 2,6E+09 | 1,19E+11 | 72,88 | 25,72 | 15,66 | 19,49 | 57,69 | 40,83 | 63,86 | 73,95 | 59,55 |

*Tablo 3. Özet İstatistikler*

Klasik model geçerli olmadığı için, Hausman Testi kullanılarak sabit etkiler modelinin mi, yoksa tesadüfi etkiler modelinin mi geçerli olduğu araştırılmıştır. Hausman Testinde temel hipotez; "bağımsız değişkenlerle birim etki arasında korelasyon yoktur" şeklinde iken, alternatif hipotez ise; "bağımsız değişkenler ile birim etki korelasyonludur" şeklindedir. Eğer, temel hipotez reddedilemez ise hem sabit etkiler hem de tesadüfi etkiler tahmincisi tutarlıdır. Ancak, tesadüfi etkiler tahmincisi daha etkindir. Bunun yanında, temel hipotez reddedilir ise tesadüfi etkiler tahmincisi sapmalıdır. Bunun yerine tutarlı olan sabit etkiler tahmincisi kullanılmaktadır (Yerdelen Tatoğlu, 2012).

Çalışmada tahmin edilecek beş modelin her biri için Hausman Testi yapılmıştır. Hausman testine ilişkin tüm sonuçlar temel hipotezin reddedildiğini göstermektedir (Bkz. Tablo 4). Buna göre, tesadüfi etkiler tahmincisi sapmalıdır. Çalışmada kullanılan beş modelin tahmin edilmesinde de tutarlı olan sabit etkiler tahmincisinin kullanılmasına karar verilmiştir. Sabit etkiler modeli, Grup İçi Tahmin Yöntemi referans alınarak tahmin edilmiş ve bu modele ilişkin sonuçlar Tablo 4'te gösterilmiştir.

***Tablo 4.*** *Panel Veri Modellerine İlişkin Tahmin Sonuçları*

Tablo 4, farklı değişkenlerin kullanıldığı beş modele ilişkin sonuçları özetlemektedir. Özellikle kontrol değişkenlerden Reel GSYİH (RGDP) ve Dışa Açıklık Oranı (OPEN) değişkenlerinin katsayıları literatürde daha önce yapılan çalışmalardaki gibi çıkmıştır. Buna göre, dahil edildiği her modelde RGDP ve OPEN değişkenleri pozitif ve anlamdır. Yani, piyasa hacmini ifade eden reel GSYİH düzeyi ve dışa açıklık düzeyindeki artışlar yedi Balkan ülkesine yönelik doğrudan yabancı sermaye girişlerini arttırmaktadır. Asiedu (2002)'nin çalışmasında anlamsız çıkan altyapı düzeyini gösteren değişkenin katsayısı, birinci, üçüncü ve dördüncü modelde anlamlı çıkmasına rağmen işareti negatiftir. Kamu harcamaları/GSYİH (GOV) ve Ekonomik İstikrar (ESTA) değişkenleri ise dahil edildikleri tüm modellerde anlamsız çıkmışlardır. Sabit terim katsayısı (C) ise, tüm modellerde anlamlı olarak tahmin edilmiştir.

Ekonomik özgürlükleri ifade eden değişkenlere yönelik sonuçlar incelendiğinde ise, öncelikle çalışmadaki tüm değişkenlerin birinci modele dahil edildiği görülmektedir. Diğer modellerde ise ekonomik özgürlük düzeyini gösteren alt endeksler modele tek tek alınarak ikinci, üçüncü, dördüncü ve beşinci modeller tahmin edilmiştir. Ekonomik özgürlüğü ifade eden genel endeks (GEFI) yalnızca birinci modele dahil edilmiş ve değişkenin katsayısı anlamsız çıkmıştır. Ekonomik özgürlüğün alt kriterlerinden olan mülkiyet hakları endeksi (PRI) de birinci ve ikinci modele dahil edilmesine rağmen bu değişkenin de katsayısı anlamsız çıkmıştır.

Öte yandan, birinci ve üçüncü modellere dahil edilen iş kurma özgürlüğü endeksi (BFI) ile birinci ve dördüncü modellere dahil edilen ticaret özgürlüğü endeksi (TFI)'nin katsayıları ise pozitif ve anlamlı çıkmıştır. Buna göre; Balkan ülkelerindeki iş kurma konusunda özgürlüklerin artması ve ticaret konusundaki kısıtlamaların kaldırılması, iş potansiyelinin, ekonomik aktivite ve rekabet düzeyinin yükselmesine yol açarak bu piyasaları daha etkin hale getirmekte ve doğrudan yabancı sermaye girişlerini hızlandırmaktadır. Son olarak, birinci ve beşinci modellere dahil edilen yatırım yapma özgürlüğü endeksi (IFI) ise, her iki model de anlamsız çıkmıştır. Bu durumun ortaya çıkmasında, yatırım yapma serbestisindeki artışların yatırımcıların özellikle Balkan ülkeleri gibi ekonomik ve siyasi açıdan belli riskleri barındıran ülkelere yönelik yatırım kararlarını riskli dönemlerde yeniden gözden geçirmelerinin neden olduğu düşünülmektedir.

## 5 Sonuç

Gelişmekte olan ülkeler, ekonomik büyüme vb. amaçlarla özellikle 1980'li yıllardan itibaren yoğun biçimde yabancı sermaye çekme yarışı içerisine girmişlerdir. Yabancı sermaye türleri arasında doğrudan yabancı sermaye,

ülkenin teknoloji düzeyini ilerletme, istihdam artışı sağlama, ülke içi piyasaları genişletme, altyapı düzeyini geliştirme, hammaddelerin etkin dağılımını sağlama, beşeri sermaye düzeyini yükseltme gibi bir takım avantajları da beraberinde getirmektedir. Doğrudan yabancı sermaye yatırımı yapan çok uluslu şirketler ise kazançlarını en yüksek düzeye çıkarma güdüsüyle hareket etmekte ve gelişmekte olan ülkelere yatırım yapma konusunda seçici davranmaktadırlar. Bu durum, gelişmekte olan ülkeler açısından doğrudan yabancı sermaye girişlerini belirleyen faktörlerin analiz edilmesini gerekli kılmaktadır.

Çalışmada bu çerçevede, Türkiye, Bulgaristan, Yunanistan, Romanya, Makedonya, Arnavutluk ve Hırvatistan'a yönelik doğrudan yabancı sermaye girişlerini belirleyen faktörler incelenmiştir. 1995 yılından itibaren Heritage Vakfı ve Fraser Enstitüsü tarafından ekonomik özgürlüğe ilişkin endekslerin yayınlanması, doğrudan yabancı sermaye girişlerini belirlemede ekonomik özgürlüğün ve ekonomik özgürlüğe ilişkin alt endekslerin de incelenmesine imkan vermiş ve bu çalışmada da ekonomik özgürlük kriterleri, doğrudan yabancı sermaye girişlerinin belirlenmesinde temel faktörler olarak kullanılmıştır. 1994-2012 dönemini içeren çalışmada birim ve zaman boyutunun fazla olması panel veri yönteminin kullanılmasını zorunlu hale getirmiştir. Ekonomik özgürlükler ve doğrudan yabancı sermaye girişi arasındaki ekonometrik ilişkinin analizinde farklı değişkenleri içeren beş farklı model kullanılmıştır. Yapılan F testi ve Hausman testi sonucunda panel sabit etkiler modelinin geçerli olduğu saptanmıştır.

Analiz sonuçları incelendiğinde, reel GSYİH ve dışa açıklık oranı değişkenlerinin katsayıları literatürdeki çalışmalara uygun şekilde pozitif ve anlamlı çıkmıştır. Yani, ülkelerin iç piyasa büyüklüğünü ifade eden reel GSYİH düzeyi ve dışa açıklık düzeyindeki artışlar analize dahil edilen Balkan ülkelerine yönelik doğrudan yabancı sermaye girişlerini arttırmaktadır. Yüz kişi başına düşen internet erişimi ülkelerin altyapı düzeyini göstermekte olup, bu değişkenin katsayısı, birinci, üçüncü ve dördüncü modelde anlamlı çıkmasına rağmen işareti negatiftir. Kamu kesiminin ekonomiye müdahale düzeyini gösteren kamu harcamaları/GSYİH ve ekonomik istikrar düzeyini gösteren enflasyon oranı değişkenleri ise dahil edildikleri tüm modellerde anlamsız çıkmışlardır.

Ekonomik özgürlük değişkenlerine yönelik sonuçlar incelendiğinde ise, ekonomik özgürlüğü ifade eden genel endeks değişkeninin katsayısı anlamsız çıkmıştır. Ekonomik özgürlüğün alt kriterlerinden olan mülkiyet hakları endeksinin katsayısı da dahil edildiği modelde anlamsız çıkmıştır. Bunun yanında, iş kurma özgürlüğü endeksi ile ticaret özgürlüğü endeksinin katsayıları ise pozitif ve anlamdır. Buna göre; Balkan ülkelerindeki iş kurma konusunda özgürlüklerin artması ve ticaret konusundaki kısıtlamaların kaldırılması, iş potansiyelinin, ekonomik aktivite ve rekabet düzeyinin yükselmesine yol açarak bu piyasaları daha etkin hale getirmektedir. Bu durum, dolaylı yabancı sermaye girişlerini hızlandırmaktadır. Modelde kullanılan ekonomik özgürlük endekslerinden sonuncusu olan yatırım yapma özgürlüğü endeksi de yine genel endeks ve mülkiyet hakları endeksi gibi anlamsız çıkmıştır. Bu durumun ortaya çıkmasında, diğer gelişmekte olan ülkelerde olduğu gibi Balkan ülkelerinde de yatırım yapma serbestisindeki artışların, yatırımcıların ekonomik ve siyasi açıdan belli riskleri barındıran ülkelere yönelik yatırım kararlarını riskli dönemlerde yeniden gözden geçirmelerinin neden olduğu düşünülmektedir.

Sonuç olarak ekonomik özgürlük düzeyi genel ekonomik özgürlük endeksi bazında olmasa da, iş kurma özgürlüğü endeksi ve ticaret özgürlüğü endeksi bazında doğrudan yabancı sermaye girişlerinde önemli bir belirleyici durumundadır. Balkan ülkelerinde iş kurma serbestisi ve ticaret konusunda daha özgürlükçü politikaların izlenmesi doğrudan yabancı sermaye girişlerinde olumlu bir etki doğuracaktır.

# Real Exchange Rate Effects on Trade and Immiserizing Growth: The Case of Turkey 2003-2013

Ph.D. Candidate Yağmur Sağlam (Dokuz Eylül University, Turkey)
Prof. Dr. Hüseyin Avni Egeli (Dokuz Eylül University, Turkey

## Abstract

The aim of this study is to examine the long run relationship between real exchange rates and trade within terms of immiserizing growth for Turkey. The relationship between real exchange rates and trade are taking into consideration with two approach which are pass-through and standard theory. So it is observed that which approach is valid for Turkey. Also we tried to see if trade policies which on terms of trade create immiserizing growth or not during the period. We used unrestricted Vector Autoregressive Model (VAR) analysis to see the relationship between real exchange rate and trade rate, growth. Also we added a dummy into the VAR which demonstrate the structural break for global economic crisis as an exogenous variable. The results of the application are; in the long term there is no cointegration between trade rate and real exchange rates and growth. So for the short term; the dummy was statistically significant and affects the distribution of series; the relationship between trade rate and real exchange rates are very weak and rarely supports the Standard Theory. Also terms of trade impacts growth rate positively but the effects of growth rate on terms of trade is indeterminate. So there is not an immiserizing growth in Turkey for the period between 2003 and 2013.

## 1 Giriş

Dış ticaret günümüzde ekonomik büyümenin temel belirleyeni olarak kabul edilmektedir. Dış ticaretteki serbestleşmenin ise ekonomik büyümeyi olumlu yönde etkilediği görüşü hakimdir. Dış ticaret ekonomik büyümenin belirleyicisi olarak kabul edilirken Türkiye'de dış ticaret stratejilerinin gelişimi ele alındığında uygulanan döviz kuru politikasının dış ticaret üzerine etkileri ve aralarındaki uzun ve kısa dönemli ilişki ön plana çıkmaktadır. Literatürde döviz kurları ve dış ticaret hadleri arasındaki nedenselliği açıklayan iki temel yaklaşım bulunmaktadır. Bunlar; "Standart Teori" ve "Yansıma" (pass through) yaklaşımlarıdır. Zengin (2000), standart teori ticaret hadlerindeki bir iyileşmenin dışarıdan içeriye doğru olan gelir transferi ile yurtdışı fiyat düzeyinin yurtiçi fiyat düzeyinde göreli bir artışa neden olacağını yani nedenselliğin yönünün ticaret hadlerindeki değişimlerden reel döviz kurlarına doğru olduğunu ifade ederken, yansıma yaklaşımı daha çok bir geri besleme yaklaşımıdır. Nedenselliğin yönü döviz kurlarındaki değişimden ticaret hadlerine doğru fakat ters yönlüdür.

Literatürde hala üzerinde bir anlaşmaya varılamayan bu konu Türkiye ekonomisi gibi gelişmekte olan ülkeler için dış ticaret açığı ve cari açıkla mücadele açısından üzerinde durulması gereken önemli bir husustur. Çünkü Türkiye'de uygulanan döviz kuru politikaları uygulanan dış ticaret stratejilerine göre dönemsel olarak farklılıklar göstermektedir. 1980 öncesi ithal ikameci sanayileşme stratejisi ve sabit kur uygulanır iken 1989 sonrası tam konvertibilite ile ihracata yönelik, dışa açık sanayileşme stratejisi benimsenmiştir. Egeli (2001), ithal ikameci stratejinin temel amacı ilk aşamada tüketim mallarının yurt içinde kendine yetecek kadar üretimi gerçekleştirerek büyümesi ve ikinci aşamada ara ve yatırım mallarının yurtiçinde üretimini sağlayıp dışa açılmak ve bunu dış ticaret hadlerinin aleyhe dönmesini engelleyerek döviz tasarrufu sağlayarak yapmaktır. Saçık (2009), ihracata yönelik sanayileşme stratejisi ise ihracatı büyümenin kaynağı olarak görür ve amaç kaynakların ülkenin mukayeseli üstünlüğü olan alanlara kaydırılarak istihdamın artırılması ve ölçek ekonomilerinden yararlanan firmaların dış ticarette rekabete açılmalarıdır. Ancak bu stratejinin uygulanmasında bazı zorluklar vardır. Bunların başında; ihracatçıları teşvik edecek istikrarlı bir döviz kuru politikası uygulanması gelmektedir. Türkiye 1980-1989 yılları arasında kontrollü serbest kur sistemi uygulamıştır. Kasım 2000 ve Şubat 2001 krizleri sonrasında ise Merkez Bankası (MB) müdahalelerinin sınırladığı dalgalı (serbest) kur uygulamasına geçilmiştir. Dalgalı kurun yarattığı endişe bant dahilinde ne olacağı belirsiz olan bu kurun dış ticaret hadlerini ve özellikle ihracat hacmini nasıl etkileyeceğinin bilinememesidir. Aktaş (2010), bu nedenle Türkiye'de ihracatı artırmak adına uygulanan düşük kur-aşırı değerli Türk Lirası politikası ihracatı olumsuz etkilemesi gerekirken ihracatı reel anlamda artırmıştır. Çünkü ihracata konu olan mal ve hizmetlerin üretiminde ucuz ara malı ve girdi önemli oranda kullanılmaktadır. Dış ticaret hacmi artışı cari açık pahasına ve ticarette dış bağımlılığa rağmen olmaktadır.

Türkiye'de dış ticaret hadleri ve reel döviz kurları arasında pozitif bir ilişki olduğuna dair kanı büyüme hızı arttığı halde bozulan dış ticaret hadleri varsayımı "yoksullaştıran büyüme hipotezi" bağlamında VAR yöntemi ile esnek döviz kuru sistemi ve dışa açık dış ticaret stratejilerinin hakim olduğu 2003-2013 dönemi için analiz edilmiştir. Birinci bölümde yoksullaştıran büyüme kavramı açıklanmış ve literatürdeki gelişmeler ele alınmıştır.

İkinci bölümde reel döviz kuru ve dış ticaret hadleri arasındaki ilişki VAR analizi yapan çalışmalar bağlamında özetlenerek literatür taraması yapılmıştır. Üçüncü bölüm ise durağanlık testleri, Johansen koentegrasyon testi, VAR analizi ve istikrar testleri ile varyans ayrıştırma/etki-tepki fonksiyonlarının grafiklerinden ve bunların yorumlarından oluşmaktadır. Sonuç kısmında ise 2003M1-2013M12 dönemi için elde edilen bulguların Türkiye açısından iktisaden değerlendirilmesi yer almaktadır.

## 2   Yoksullaştıran Büyüme

Dış ticaretin serbestleşmesi ve ekonomik büyüme arasında bir nedensellik ilişkisi olduğunu iddia eden iktisatçıların yanı sıra büyümenin gelişmekte olan ülkelerin aleyhine sonuç vereceğini düşünen iktisatçılarda mevcuttur. Krugman ve Obstfeld (1997), ihracata yönelik büyümeyi benimsemiş olan gelişmekte olan ülkelerin dış ticaret hadlerinin eskiden sahip oldukları konuma göre daha kötü bir duruma gelebileceklerini ve ekonomik büyümenin dış ticaret hadlerini bozduğunu ileri sürmektedirler. "Yoksullaştıran Büyüme" (immiserizing growth) olarak adlandırılan bu kavram ilk olarak 1984 yılında Edgeworth tarafından ortaya konulmuştur. Ancak Edgeworth dış ticaret artışının dış ticaret hadlerini olumsuz etkilediğini ifade ederek bu kavramın temellerini atmıştır. Edgeworth'den sonra iki farklı yoksullaştıran büyüme kavramı ön plana çıkmıştır. Bunlar; Bhagwati (1958) ve Johnson (1967) tarafından geliştirilmiştir.

Bhagwati (1958) ekonomik büyüme/kaynak artışı gerçekleştikçe ticaret hadlerinin bozulduğunu ve yabancı ülkenin yerli ülkenin mallarına olan ithalat talebinin düşüp, aşırı döviz talebinin azaldığını kayıtsızlık ve dönüşüm eğrileri yardımıyla ifade etmiştir. Johnson (1967) ise sektörlerden birinin rekabete karşı ad valorem vergi ile korunması durumunda o sektöre yoğunlaşan kaynak aktarımının getireceği ek maliyetlerin neden olacağı dış ticaret hadlerindeki yükselmenin ekonomik büyümeyi olumsuz etkileyeceğini iddia etmiştir (Erk vd, 1999). En önemli katkı ise Melvin (1969) tarafından, yoksullaştıran büyümenin ekonomide bir bozulmanın olmadığı ortamda dahi çıkabileceği iddiası ile yapılmıştır. Ayrıca Matsuyama (1991) yoksullaştıran büyümenin ölçümünde en etkin modelin Diamond (Elmas) Modeli olduğunu ileri sürerken, Clarete ve Whalley (1994) yılında Filipinler üzerine yaptıkları çalışmada Bhagwati ve Johnson bağlamında genel denge modeli çerçevesinde yoksullaştıran büyümeyi ölçmüşlerdir. Başkonuş (1995), tarihi gelişimi içerisinde ekonomik büyümeden kaynaklanan birbirine zıt iki etkiden; dış ticaret hadlerindeki bozulman refah azaltıcı etkisi eğer üretim artışının refah etkisinden büyük ise dışarıya aktarılan gelirlerin büyümenin yarattığı gelir artışından fazla olacağı ve yoksullaştıran büyümeye yol açacağı şeklinde ifade etmektedir. Ateş ve Bostan (2007), yoksullaştıran büyüme hipotezi ile test edilen modellerde genellikle aşağıdaki model kalıbı kullanılmaktadır.

$$g_t = a(L)g_{t-1} + b(L)\left(\frac{P_x}{P_m}\right) + \varepsilon_t \tag{1}$$

$g_t$ Gayri Safi Yurtiçi Hasıla (GSYH) büyüme oranını, $P_x$ ihracat fiyatı, $P_m$ ithalat fiyatı ve $a(L)b(L)$ gecikme (lag) işlemlerini ifade etmektedir. Bhagwati, yoksullaştıran büyümenin alt koşullarını şu şekilde tanımlamıştır (Acar, 2012);

-İthal ikamesi üretiminin ithalata oranının düşmesi,

-İthal malları talebinin ve arzının fiyata göre inelastik olması,

-Büyüyen ülkenin ihraç mallarının dış alemde inferior mal olması,

-Sabit nispi fiyatlarda ithal ikamesi malları üretiminin büyüme süreci içerisinde azalmasıdır.

Yukarıda sayılan alt koşullar dikkate alındığında Türkiye emek-yoğun ve orta düzeyde bir teknoloji ile katma değeri birden düşük ve ithal girdiye bağımlı mallar üreten gelişmekte olan bir ülke olduğu için yoksullaştıran büyüme kavramının incelenmesi önemli ve gerekli bir husustur.

Erk ve diğerleri (1999) VAR analizi ile inceledikleri çalışmalarında Türkiye-Avrupa Birliği ülkeleri arasında 1980-1998 dönemini sadece GSYH büyüme hızı ve dış ticaret hadleri arasındaki ilişkiyi incelemiş ancak dış ticaretin ve büyümenin temel belirleyeni olarak ele alınan reel döviz kuru analiz dışarısında bırakılmıştır. Ateş ve Bostan (2007) yılında yaptıkları çalışmada 3 değişkeni bir arada ele almışlardır. Fakat uyguladıkları çift yönlü koentegrasyon yöntemi ile dış ticaret ve döviz kuru arasındaki ilişkiyi sadece yansıma yaklaşımı çerçevesinde ve reel döviz kurunu önce dışsal sonra içsel kabul ederek sonuca gitmeye çalışmışlardır. Bu anlamda istatistiki olarak anlamlılık seviyesi yeterli olmayan sonuçlara ulaşmışlardır. Bu çalışmada yukarıda belirtilen bu üç değişken birlikte analiz edilmiş ve içsel-dışsal değişken tanımlaması yapılmak zorunda kalınmamıştır. Çünkü kısıtsız VAR analizi ile ele alınan aylık seriler sistem yaklaşımı içerisinde en dışsaldan içsele doğru sıralanır. Varyans ayrıştırması ve etki-tepki fonksiyonları sayesinde değişkenler arası ilişkinin yönü ve birbirleri üzerinde yarattıkları şokların kalıcı mı yoksa geçici mi olduğu görülmektedir. Bu nedenle, literatür kısmında reel döviz kuru ve dış ticaret hadleri arasındaki ilişkiyi inceleyen belli başlı ulusal ve uluslararası çalışmalara yer verilmiştir. Literatür incelenirken yoksullaştıran büyümeyi VAR analizi ve bu 3 değişken ile birlikte ele alan pek çalışmaya rastlanılmamıştır.

## 3    Literatür

Dış ticaret hadleri ve reel döviz kuru arasındaki ilişkileri inceleyen yerli ve yabacı literatürde gerek yöntem gerekse elde edilen sonuçlar bakımından tam bir birliktelik sağlanmamıştır. Birçok çalışma bu değişkenler arasında nedensellik ilişkisi bulamaz iken bazen kısa dönemde pozitif ancak uzun dönemde döviz kuru belirsizliğinin ihracat hacmini negatif etkilediği de görülmüştür. Bu nedenle çalışmaların ortak özellikleri dahilinde verilmesi, literatürün özetlenmesi ve anlaşılması açısından kolaylık sağlayacaktır.

Zengin (2000), 1994:1-2000:2 dönemi için reel döviz kuru ve ihracat-ithalat fiyat endeksleri arasındaki ilişkiyi standart teori ve yansıma yaklaşımı açısından VAR analizi ile Türkiye için ele almıştır. İhracat ve ithalat fiyat endekslerinden reel döviz kurlarına direkt bir nedensellik söz konusu olmadığını ancak reel döviz kurlarından ithalat fiyat endeksine direkt, ihracat fiyat endeksine ise ithalat fiyat endeksi üzerinden dolaylı bir etki sağladığını ifade etmiştir. Yılmaz ve Kaya (2007), 1990:1-2004:6 dönemini aylık veriler ile Türkiye için VAR analizi ile çalışmışlardır. Elde ettikleri bulgulara göre ithalat ve ihracat arasında karşılıklı nedensellik ilişkisi vardır. Fakat reel döviz kurundaki değişimlerin dış ticaret dengesi üzerine anlamlı bir etkisi yoktur. Alptekin (2009), 1992:1-2009:1 dönemi için aylık verilerle yaptıkları VAR analizi ile kısa dönemde değişkenler arasında herhangi bir ilişki olmadığını ancak uzun dönemde aralarında bir ilişki olduğunu tespit etmişlerdir. Altıntaş ve Öze (2010), 1989-2008 dönemini çeyrekli veriler ile analiz etmişlerdir. VAR analizi ve Error Correction Mechanism (Hata Düzeltme Mekanizması) ile ele aldıkları değişkenlerden uzun dönemde ihracat ve kur değişkenliği ile nispi ihracat fiyatı arasında negatif, doğrudan yabancı sermaye girişi arasında pozitif ve anlamlı bir ilişki bulmuşlardır. Aktaş (2010), 1989:1-2008:4 dönemini çeyrekli veriler ile Türkiye için VAR analizi kapsamında incelemişler ve reel kurdaki bir değişmenin dış ticaret dengesi üzerinde anlamlı bir etkide bulunmadığını ve reel döviz kuru uygulamalarının dış ticaret açıklarını gidermede etkin bir araç olmadığını ifade etmişlerdir.

| Olumsuz Etki (ilişki yok) | Olumlu Etki (ilişki var) |
|---|---|
| Cushman (1983) | Dellas ve Zilberfarb(1993) |
| Arize (1987) | Mckenzie ve Brooks (1997) |
| Pozo (1992) | Shirvani ve Wilbrate (1997) |
| Malindretos ve Kasibhatla (2003) | Liev, Lim ve Hussain (2005) |
| Lee ve Saucier (2005) | Zhe (2007) |

*Tablo 1. Döviz Kuru Belirsizliğinin Dış Ticaret Üzerine Etkileri (Yabancı Literatür)*

Yukarıda özetlenen çalışmalardan da görüldüğü gibi reel döviz kuru ve dış ticaret hadleri (ihracat-ithalat fiyat endeksi) arasındaki ilişkilerin ortaya konması Türkiye Ekonomisi ve yoksullaştıran büyüme kavramına açıklık getirilmesi bakımından önem taşımaktadır. Bir sonraki bölümde veri ve yöntem ele alınmış, elde edilen bulgular değerlendirilmiştir.

## 4    Veri ve Yöntem

Reel döviz kuru (LRDK), dış ticaret haddi (LDTH), GSYİH büyüme hızı yerine vekil değişken olarak sanayi üretim endeksi alınmış (LSUE) ve seriler aylık olarak 2003M1 ve 2013M12 dönemleri için incelenmiştir. Vekil değişken ile çalışılmasının nedeni; GSYİH verilerinin çeyrekli olarak açıklanması ve gözlem sayısını azaltarak sapmalı sonuçlara neden olmasıdır. Tüm değişkenler Census X-12 testi ile mevsimsel etkilerden arındırılmış ve logaritmik olarak kullanılmıştır. Seriler Türkiye Cumhuriyet Merkez Bankası Elektronik Veri Dağıtım Sistemi (EVDS) ve Türkiye İstatistik Kurumu'ndan (TÜİK) elde edilmiştir. Serilere yapılan ilgili testler Eviews 8 paket programı ile yapılmış olup, 2003 öncesi dönemin ele alınamama nedeni değişen baz yıllara dayalı hesaplanan veri kısıtıdır.

### 4.1  Vektör Otoregresif Model (VAR)

Seriler Sims (1980), Litterman (1979) ve Doan (1984) tarafından geliştirilen VAR tekniği ile analiz edilmiştir. Makro ekonomik değişkenler birbiri ile etkileşim içerisinde olduğu için açıklayıcı ve bağımlı değişken ayrımına gitmek ve eşanlı denklemleri bazı kısıtlamalar altında çözmek zorlaşmaktadır. VAR modeli birbiri ile bağlantılı (içsel) değişkenlerin birlikte nasıl hareket ettiğini açıklayan sistem modeli olup, VAR modelleri yapısal model üzerine herhangi bir kısıtlama getirmeksizin dinamik ilişkileri tanımlamakta ve zaman serileri için sıkça kullanılmaktadırlar (Aktaş, 2010).

Enders (1995), VAR sistemi ile analiz edilen değişkenlerin durağanlığı konusu tartışma konusudur. Çünkü durağan olmayan (trend/birim kök içeren) seriler ile yapılan katsayı tahminleri sapmalı ve tutarsız çıkacağı için istatistiksel olarak doğru olmayan sonuçlar ortaya çıkaracak hatta değişkenler arası sahte regresyon sorununa yol açacaktır. Taylor (1989), birim kökün iktisadi anlamını şoklar ve yapısal kırılmaların seriler üzerinde kalıcı etkiler bırakması olarak tanımlamaktadır. Ancak Sims (1980) ve Doan (1992), VAR analizinin amacının katsayı tahmini olmadığını bu nedenle birim kök içerseler dahi değişkenlerin farkının alınmadan düzey değerleri ile kullanılması gerektiğini savunmaktadırlar. Cooley ve Leroy (1985), çünkü VAR ile amaç değişkenler arası

ilişkilerin belirlenmesidir. Lutkepohl (1982), zorlayıcı ve yapma bir kısıt olmasına rağmen sisteme tüm değişkenler için sabit bir gecikme uzunluğu önermiştir. Enders (1995), burada amaç eşanlı denklemler arası simetriyi korumak ve En Küçük Kareler (EKK) yöntemi ile hesaplanan değişken katsayılarını tutarlı ve asimptotik kılmaktır. Gecikmeli değerlere sahip değişkenler denklemin sağ tarafında yer alır ve modelde otokorelasyonun mevcut olmadığı durumda tahmin edilirler. Ayrıca gecikme uzunluğu hesaplanırken hata terimleri arasında otokorelasyona sebep olmayacak kadar büyük bir sayı olarak hesaplanmaktadır (Zengin, 2000).

VAR modeli matematiksel olarak şu şekilde ifade edilmektedir (Karaçor ve Gerçeker, 2012);

$$\Delta X_t = A_0 + \alpha_i \Delta X_{t-i} + \beta_0 A_t + \varepsilon_t \tag{2}$$

VAR modelinin standart biçimi olup; $X_t$ ve $X_{t-i}$ içsel değişkenler olur, $A_t$ dışsal değişken vektörüdür. Çalışmada değişkenler uzun dönemde eş bütünleşik çıkmadıkları ve vektör hata düzeltme mekanizması (VECM)'ye gidilmeyeceği için farkları alındıktan sonra VAR analizi yapılmıştır. Gecikme uzunluğu Akaike (AIC) ve Schwarz (SC) v.b. bilgi kriterlerine bakılarak seçilmiştir. VAR analizine geçmeden önce sistemde yer alacak serilerin özellikleri ayrı ayrı ve birlikte incelenmiş Augmented Dicky Fuller (ADF), Phillips-Perron (PP), Kwiatkowski-Philips-Schmidt-Shin (KPSS), Zivot-Andrews (ZA) birim kök testleri ve Johansen eşbütünleşme testi yapılmıştır.

### 4.2 Varyans Ayrıştırması ve Etki-Tepki Fonksiyonları

Varyans ayrıştırması ile bir makro ekonomik büyüklük üzerinde en etkili değişken bulunurken, etki-tepki fonksiyonları sayesinde bu değişkenin politika aracı olarak kullanıp kullanılamayacağı belirlenmektedir. Enders (1995), varyans ayrıştırmaları içsel değişkenlerden birisindeki değişimin diğer tüm içsel değişkenleri etkileyen ayrı ayrı şoklar olarak ayırır ve diğer değişkenlerde meydana gelen şokların kaynaklarını yüzde olarak ifade eder. Özgen ve Güloğlu (2004), bir değişkende meydana gelen değişim kendi üzerine yarattığı şoklardan kaynaklanıyor yani diğer bir değişkenin öngörü hata varyansını etkilemiyor ise o değişken dışsal kabul edilmektedir. Eğer etkiliyor ise o değişken içseldir demektedir. Varyans ayrıştırmaları değişkenler arası nedensellik ilişkilerinin sırası ve derecesi hakkında bilgi vermektedir.

Runkle (1987), etki-tepki fonksiyonları ($\pm 2$) standart sapma güven sınırları dahilinde oluşuyor ise istatistiki olarak anlamlıdır ve Monte-Carlo simülasyon tekniği ile bu sınırlar hesaplanmaktadır. Etki-tepki fonksiyonlarının kullanılması değişkenlerden birinde meydana gelen bir standart hata kadarlık şokun her bir değişkenin gösterdiği dinamik tepkiyi ve bu şokların etkisinin kaç dönem sonra kaybolduğu ve belirsiz duruma düştüğünü ifade etmektedir. Etki-tepki fonksiyon grafiklerinde kesikli çizgiler güven aralıklarını, sürekli çizgi ise modelin hata terimlerinde meydana gelen şoka karşı bağımlı değişkenin gösterdiği tepkiyi ifade etmektedir (Aktaş, 2010; Zengin, 2000).

## 5 Ampirik Bulgular

Bu bölümde değişkenler üzerine tek tek ve birlikte yapılan ekonometrik testlerin bulgularına ve yorumlarına yer verilmiştir. Tablo 2'den görüleceği gibi değişkenlere dört farklı birim kök testi yapılmıştır. Değişkenlerin düzey değerleri LRDK değişkeninin PP testi sonuçları haricinde durağan değildir, birim kök içermektedir. Birim kökün iktisadi anlamı şokların seri üzerinde kalıcı bir etki bırakmasıdır. Bu nedenle birinci farkı alınan değişkenlerin durağan oldukları görülmektedir. ADF ve PP test istatistiklerinin %5 seviyesinde anlamlı olduğu birim kök içermedikleri görülmüş ve serilerin durağan olduğunu iddia eden $H_0$ hipotezi kabul edilmiştir.

ADF (1979-1981) ve PP testi (1988) birbirinin tamamlayıcısıdır. PP testi yarı parametrik bir test olup ADF testinin hata terimi için geçerli varsayımlarını yumuşatmaktadır. Hata terimi zayıf bağımlı ve heterojen olabilmektedir. ADF testine alternatif bir test KPSS (Kwiatkowski-Philips-Schmidt-Shin) testidir. KPSS testinde $H_0$ ve alternatifi yer değiştirmiştir. $H_0$ birim kökün olmadığını serilerin durağan olduğunu iddia etmektedir. LM istatistiği, (KPSS 1992* kritik değerleri) ile karşılaştırıldığında % 5 anlamlılık düzeyinde serilerin birinci farkı durağandır. Burada tek istisna LRDK değişkeninin sabit ve trendli düzey değerinin de durağan olmasıdır ancak sabit ve trendsiz düzey değeri birim kök içerdiği için KPSS testi uygulanmalıdır. Yapılmış olan bu üç test yapısal kırılmayı dikkate almadığı için sahte birim köke neden olabilmektedir. Ayrıca serilerin ait olduğu dönemde 2008 küresel ekonomik krizi yaşanmış ve etkileri 2009-2010 yıllarında görüldüğü için yapısal kırılmalı birim kök testi uygulanmalıdır. Kırılma yılını tek ve içsel kabul eden yani kendi belirleyen Zivot-Andrews (1992), testi kırılmanın yarattığı yapısal değişimin sahte birim köke neden olup olmadığını göstermektedir. $H_0$ hipotezi sahte birim kök olmadığını iddia etmektedir. Zivot- Andrews testi sonuçlarına göre; LDTH, LRDK ve LSUE değişkenlerinin düzey değerleri için kırılma durumunda dahi birim kök vardır. Tek istisna LRDK değişkeni trendli olasılık değerinin %5'te anlamlı olmayışıdır. Bu durum haricinde değişkenler I(1)'dir. Tek tek durağanlığı incelenen serilerin koentegre olup olmadıklarını anlamak için Johansen (1988) eş bütünleşme testi yapılmış ve analiz sonuçları Tablo 3'te verilmiştir.

| Değişkenler | ADF Testi (t-ist.) | | Phillips-Perron (PP) Testi (t-ist.) | |

***Tablo 4.*** *VAR Analizi İçin Optimal Gecikme Uzunluğu*

    Eş bütünleşme analizi sonuçlarına göre iz istatistikleri ve maksimum öz değer istatistikleri kendine ait kritik değerlerden küçük olduğu için koentegre vektör yoktur boş hipotezi % 5 anlamlılık düzeyinde kabul edilir. Değişkenler arasında uzun dönemde eş bütünleşik bir ilişki mevcut değildir. Bu nedenle kısa dönemi analiz etmek ve değişkenlerin birbirini ne yönde etkilediğini görmek için VAR analizi yapılmıştır. VAR ayrıştırması sonuçlarına geçmeden önce VAR gecikme uzunluğu tespit edilmelidir. Optimal gecikme uzunluğunu belirlemek için Hannan Quin (HQ), Schwarz (SC), Akaike (AIC), Final Prediction Error (FPE), Likelihood Ratio (LR) bilgi

kriterlerine (en düşük oldukları değerler*) göre bir gecikme alınması gerekmektedir. Tablo 4'e göre AIC, FPE ve LR üçüncü gecikme için en düşük değerlerini almışlardır.

Bir değişken üzerinde en çok hangi değişkenin etkili olduğunu anlamak adına tüm değişkenleri içsel kabul eden VAR analizinde en dışsaldan içsele doğru değişkenleri sıralamak için varyans ayrıştırması yapılmış ve testin sonuçları Tablo 5'te verilmiştir.

| DLDTH/DLDTH | DLRDK | DLSUE | DLRDK/DLDTH | DLRDK | DLSUE | DLSUE/DLDTH | DLRDK | DLSUE |
|---|---|---|---|---|---|---|---|---|
| 1 | 100.00 | 0.00 | 0.00 | 1 | 0.02 | 99.97 | 0.00 | 1 | 99.91 | 0.00 | 0.08 |

| 10 | 97.62 | 1.92 | 0.45 | 10 | 8.84 | 88.03 | 3.12 | 10 | 97.67 | 1.85 | 0.47 |

*Tablo 5. Varyans Ayrıştırması Sonuçları*

Varyans ayrıştırma tablosunu incelediğimizde dış ticaret hadlerinin daha çok kendi üzerindeki bir birim standart hatalık şoklardan etkilendiğini diğer değişkenlerin yarattığı şoklardan etkilenmediğini ifade edebiliriz. Aynı şekilde reel döviz kuru daha çok kendi üzerindeki şoklardan etkilenirken dış ticaret hadleri üzerinde bir etki (yansıma yaklaşımı) bırakmadığını ancak dış ticaret hadlerindeki değişimlerin reel döviz kurları üzerinde çok az da olsa etkili (standart teori) olduğunu söyleyebiliriz. Çünkü LRDK'daki bir birim standart hatalık şok dokuzuncu dönemde; yaklaşık iki buçuk yıl sonra % 10 civarında dış ticaret hadlerine etki etmektedir. Ayrıca sanayi üretim endeksi (büyüme hızı) ve dış ticaret hadleri arasındaki ilişkinin yönü beklenildiği gibi dış ticaret hadlerinden büyüme hızına doğrudur ve ele alınan dönem için % 90'lar civarında ve güçlüdür. Buradan varılacak sonuç en dışsal değişken DLDTH iken dışsaldan içsel değişkene doğru sıralama DLRDK ve DLSUE şeklindedir.

*Şekil 1. AR Kökleri Birim Çember Konumu*

| Kök | Modulus |
|---|---|
| 0.951529 | 0.951529 |
| 0.894657 | 0.894657 |
| 0.825265 | 0.825265 |
| -0.391968-0.476199i | 0.616769 |
| -0.301102-0.342056i | 0.455702 |
| 0.443122 | 0.443122 |
| -0.369363 | 0.369363 |

*Tablo 6. AR Karakteristik Polinomunun Ters Kökleri*

Optimal gecikme uzunluğu ve değişkenlerin en dışsaldan içsele doğru olan sıralaması belirlendikten sonra farkı alınan değişkenler için VAR analizi yapılmıştır. Değişkenlerin farkının alınma nedeni ise stokastik bir unsuru olan yapısal kırılmaların değişkenlerin farkı alınsa bile deterministik unsurlar gibi yok olmaması yani bilgi kaybına neden olmayışıdır. Bunun yanısıra farkı alınan değişkenler VAR analizi ile birlikte eş bütünleşme analizinin yapılmasına da imkan vermektedir. Ayrıca VAR analizine 2009 yılının sekizinci ayından itibaren oluşturulan bir kukla değişken (dummy) içsel bir değişken (additive) olarak atanmıştır. Burada amaç dışsal bir şok olan 2008 küresel ekonomik krizinin seriler üzerinde yaratacağı etkiyi görmektir. Dummy istatistiki olarak

anlamlıdır ve olasılık değeri (0.0023)'dür. VAR modelinin istikrarlı olup olmadığı anlamak yani sistemin tamamının durağanlığını test etmek içinse istikrar testleri yapılmaktadır. Bu testler bir nevi sağlama testleri niteliğindedir. Tablo 6 ve Şekil 1 birlikte dikkate alındığında tüm modulus değerleri referans değer olan 1'den küçüktür ve AR köklerinin tamamı birim çember içerisinde kalmıştır. Bu nedenle kurulan VAR modelinin kendisi de (sistem) durağandır.

VAR modelinin normal dağılıma sahip olup olmadığı ayrıca Lutkepohl metoduyla analiz edilmiştir. Normallik testi sonuçlarına göre Jarque-Bera olasılık değerleri bir ve üçüncü gecikme için anlamlı olduğundan kurulan model normal dağılıma sahiptir. İkinci gecikme ise 2008 küresel ekonomik krizinden kaynaklanan dışsal şokun yarattığı etkinin serinin dağılımını bozduğunu ancak bunun geçici bir bozulma olduğunu göstermektedir.

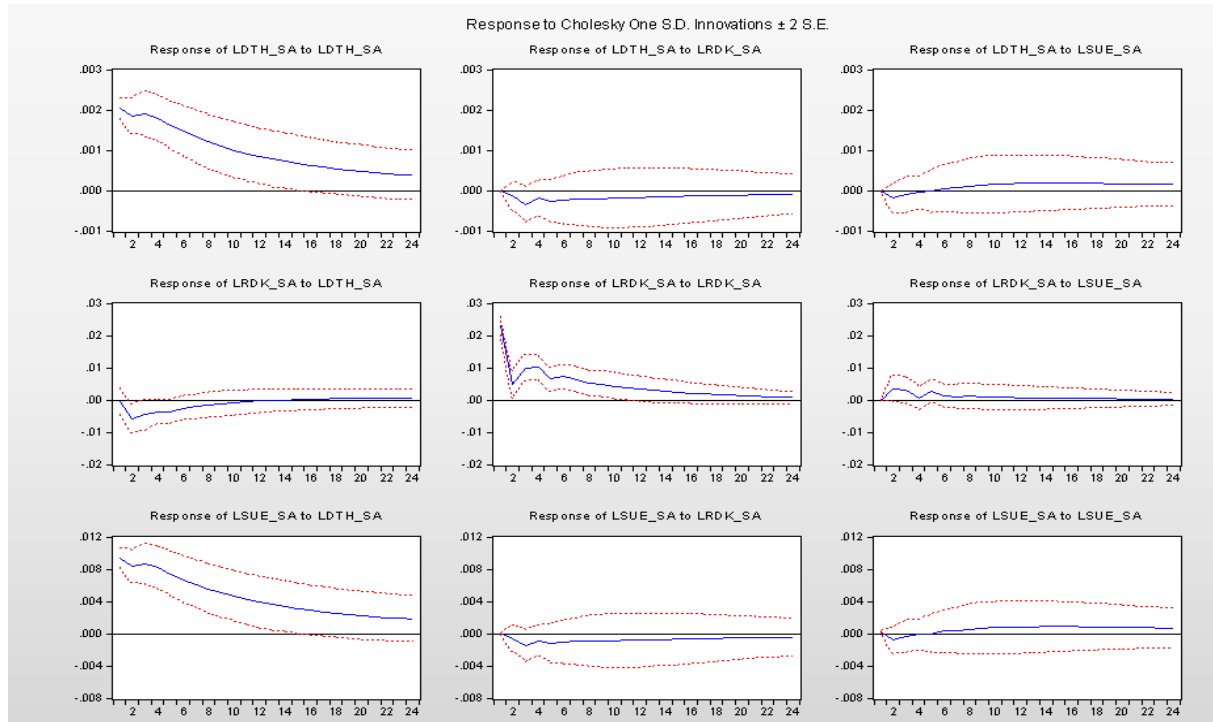
| Gecikmeler | Jarque-Bera | Olasılık |
|---|---|---|
| 1 | 2029.710 | 0.0000 |
| 2 | 3.024304 | 0.2204 |
| 3 | 520.5136 | 0.0000 |

***Tablo 7.*** *Normallik Testi Sonuçları*

Otokorelasyon LM testi ise seriler arasında ardışık (geçmişe) bağımlılık sorunu olup olmadığını görmek amacı ile yapılmıştır. Tablo 8'de ifade edilen olasılık değerleri kurulan modelin istatistiksel olarak anlamlı ve yapısal olarak tutarlı bir model olduğunu yani değişkenler arasında ardışık bağımlılık sorunu olmadığını ifade etmektedir.

| Gecikmeler | LM istatistiği | Olasılık |
|---|---|---|
| 1 | 6.074134 | 0.7325 |
| 2 | 9.933146 | 0.3559 |
| 3 | 9.026132 | 0.4349 |
| 4 | 6.791543 | 0.6588 |
| 5 | 4.815656 | 0.8501 |
| 6 | 8.415001 | 0.4929 |
| 7 | 6.772279 | 0.6608 |
| 8 | 4.979412 | 0.8361 |
| 9 | 4.835808 | 0.8484 |
| 10 | 4.336402 | 0.8879 |

***Tablo 8.*** *Otokorelasyon LM Testi Sonuçları*



***Şekil 2.*** *Etki-Tepki Fonksiyonları*

Şekil 2'ye bakıldığında DLDTH'da meydana gelen bir birim standart hatalık şoka DLRDK'nın verdiği tepki ikinci döneme kadar negatif olup daha sonra belirsiz bir hal almaktadır. Aynı şekilde DLRDK'da meydana gelen

bir birim standart hatalık şoka karşı DLDTH'nin verdiği tepki de belirsizdir. O halde bu iki değişken arasında bir ilişki olmadığını ifade edebiliriz. DLDTH'da meydana gelen bir birim standart hatalık şok karşısında büyüme hızı pozitif fakat azalan seyirde bir tepki vermektedir. Hem güven aralıkları hem de nokta tahminleri pozitif alanda birlikte yer almaktadır. Büyüme hızında meydana gelen bir birim standart hatalık şok karşısında ise DLDTH'ın tepkisi ise belirsizdir. Ayrıca yapılan VAR analizinin denklemi incelendiğinde benzer ilişkiler görülebilmektedir. VAR analizi ile amaç parametre tahmini olmadığı için regresyon katsayıları yorumlanmayacaktır. DLRDK için ilk iki gecikme ve büyüme hızı için ilk gecikme de parametre tahminlerinin önündeki işaret negatiftir, DLRDK için bire yakın iken büyüme hızı için sıfıra yakın katsayılar tahmin edilmiştir. Ayrıca DLSUE ve DLRDK değişkenleri arasındaki ilişki etki-tepki fonksiyonlarına göre belirsizdir.

## 6 Sonuç

Türkiye gibi gelişmekte olan ülkelerde ekonomilerin gelişimini devam ettirmek ve istikrarlı büyüme sürecini sürdürmek döviz kuru ve dış ticaret politikalarına bağlıdır. Döviz kuru politikaları cari açıkla mücadele için kullanılan önemli bir araçtır ve uygulanan döviz kuru politikalarından etkilenen dış ticaret ise 1980 sonrası büyümenin bir aracı olarak görülmüştür. Johansen testi değişkenler arasında koentegre ilişki olmadığını ifade etmektedir. VAR analizi sonrasında reel döviz kuru ve dış ticaret hadleri arasında yansıma yaklaşımı veya standart teoriyi destekleyecek kadar güçlü bir etki-tepki görülmemiştir. Reel döviz kurundaki oynaklıklar dış ticaret hadleri üzerinde etkili olamamaktadır. Karar alıcıların ihracatı artırarak dış ticaret açığını kapamaya yönelik uyguladığı düşük kur-aşırı değerli Türk Lirası politikasının dış ticaret dengesini sağlamada etkin bir araç olmadığını göstermektedir. Çünkü Türk Lirası yabancı para birimi cinsinden ifade edildiğinde ithalat fiyatları düşerken ihracat açısından sağlanan fiyat avantajının bir kısmı ya da tamamı kaybedilmekte ve talep ithal mallara yönelmektedir. GSYİH büyüme hızından yola çıkarak dış ticaret hadlerinin açıklanması elde edilen bulgular ile olanaklı değildir. Çünkü dış ticaret haddinde meydana gelen bir şok büyüme hızına etki ederken, büyüme hızında meydana gelen bir şoka karşı dış ticaret hadlerinin verdiği tepki belirsizdir. Ele alınan dönem için yoksullaştıran büyüme hipotezi geçerli değildir. İlişkinin etki ve tepki yönü dış ticaret hadlerinden büyümeye doğrudur. Bu nedenle dış ticareti etkileyen döviz kuru politikaları ve büyüme hızına etki eden dış ticaret politikaları Türkiye'nin üretim ve teknoloji düzeyi ile uyumlaştırılmalıdır. Türkiye emek yoğun ve katma değeri birden düşük ürünlerin ihracatçısı bir ülkedir. Yıllardır sanayileşme aşamasını tamamlamaya çalışırken eksik kalan Ar-Ge araştırmaları nedeniyle dışarıdan satın alınan orta düzeyde teknoloji yanında yaşadığı dış ticaret açığı baskısı artık Türkiye'nin üretim ve tüketim desenini uyumlaştırabilecek politika uygulamalarına ve büyüme hedeflerine, yeni üretim alanlarına ihtiyacı olduğunu açıkça ortaya koymaktadır. Ulusal paranın aşırı değerlenmesini önleyecek kur politikaları ve sanayi ile tutarlı ticaret politikaları uygulanmalıdır.

# Ticari Beklentiler Teorisi ve Çin'in Yükselişi: Barışçıl Bir Gelecek?

# Trade Expectations Theory and China's Rising: Towards a Peaceful Future?

Ph.D. Candidate Ümit Alperen (Süleyman Demirel University, Turkey)

Ph.D. Candidate Ahmet Günay (Süleyman Demirel University, Turkey)

## Abstract

Since mid-1990, it has been discussed that China's economic rise would affect political space. There are some worries that the "rejuvenation" of China as economic, politic, geo-strategic power could challenge to the current international system. Hence this rising has been called "China threat theory" and it could cause a conflict in international system. According to realist school, China's peaceful rise is almost impossible, so China will threat to the current international system and clash with hegemonic power. They also provide some empirical evidence from history. On the other hand, Liberals expresses that trade provides valuable benefits to any particular states. So, China as a dependent state should avoid from war or conflict, since peaceful trading gives it all the benefits of close ties without any of the costs and risks of war. This paper attempts to examine 'China's peaceful rise' based on interdependence and trade expectations theory within the context of international political economy. To analyze whether China threat or not to the world, we have to know the relationship between economic and politics. Trade expectations theory could explain the rise of China with establishes bridge between incompetence of realist and liberal theories. According to trade expectations theory, the rise of China will be peaceful because of China's expectations as economically are positive. For this reason, China as a rational actor chooses win-win without risk instead of win-lose or lose-lose. If China's expectations turn into negative in future, its policies could change from cooperation to conflict.

## 1 Giriş

1800'lu yılların başında, Napolyon Bonapart Çin'i uyuyan bir ejderhaya benzetir ve "Çin'i uyandırmayın, zira Çin uyanırsa bütün dünyayı sallar" ifadesi ile hem Çin "tehdidine" hem de Çin'in etkisine dikkat çekmiştir (Thurow, 2004). Napolyon'un da dikkat çektiği üzere yaklaşık 200 yıl sonra uyuyan ejderha uyandı. Çin'in, bu uyanışının dünyaya tehdit olduğu tartışmalı olsa da özellikle son yirmi yıldır göz kamaştırıcı ekonomik ve politik yükselişi bütün dünyanın dikkatini çekmektedir. Son yirmi yıllık ekonomik istatistiklerine göre, Çin reel olarak ortalama yüzde 10 yıllık büyüme gerçekleştirmektedir. Soğuk savaş sonrasında istikrarlı ve sürekli bir şekilde ortalama yüzde 10 büyüyen bir başka ülke göstermek oldukça zordur. Son yirmi yıllık büyüme ile 1980 yılında 300 milyon dolarlık GSMH'si olan Çin'in 2013'de bu rakamı 9.1 triyon dolara çıkmıştır (bknz. Tablo 1). Aşağıdaki tabloda da göründüğü üzere, Çin ekonomik büyümesini azalan bir hızla ile de olsa devam ettireceği öngörülmektedir. Azalan bir hızla ekonomik büyümesinin sürdüren Çin kendisini "gelişen ülke" konumunda tanımlamaktadır. Dolayısıyla Çin'in azalan ekonomik büyümesi gelişmekte olan bir ülkenin gelişmiş bir ülkeye evrilmesi olarak görülmeli ve ilerde gelişmiş olan Çin'in ekonomisinin yüksek olmayan büyüme hızı ile daha güçlü ve kaliteye önem veren bir ekonomiye dönüşmesi muhtemeldir. Gelecek beklentilerinde Çin'in üretim ağırlıklı bir ülkeden ziyade tasarıma önem veren, yüksek teknoloji ürünlerine dayalı bir ekonomi inşa edilmesi düşünülmektedir.

| Yıllar | RMB (Milyon) | ABD Doları (Milyon) | Reel Büyüme % |
|--------|--------------|---------------------|----------------|
| 1980 | 454,562 | 303,446 | 7.8 |
| 1985 | 901,604 | 307,023 | 13.5 |
| 1990 | 1,886,782 | 390,279 | 3.8 |
| 1995 | 6,079,373 | 707,981 | 10.9 |
| 2000 | 9,921,455 | 1,198,475 | 8.4 |
| 2005 | 18,493,737 | 2,257,169 | 11.3 |
| 2010 | 40,151,280 | 5,931,203 | 10.4 |
| 2011 | 47,310,400 | 7,324,952 | 9.3 |
| 2012 | 51,947,010 | 8,229,229 | 7.7 |
| 2013 | 56,884,521 | 9,184,997 | 7.7 |

***Tablo 1** Çin'in Ekonomik Büyümesi (1980-2013) **Kaynak:** Zhonghua Renmin Gongheguo Guojia Tongjiju (web sitesi), China Statistical Yearbook 2012.*

Şüphesiz, Çin'in ekonomik ve politik yükselişi dünya ekonomisini ve politikasını derinden etkilemektedir. Soğuk Savaş sırasında dünyadaki güç mücadelesi Doğu ve Batı bloğu arasında geçmekteydi. Fakat Soğuk Savaş

sonrasında Çin başta olmak üzere Hindistan, Brezilya, Türkiye gibi ülkelerin yükselişi ile uluslararası politikanın yeniden tanımlanmasına ihtiyaç duyulmaktadır. Soğuk Savaş sonrasında dünyanın tek süper gücü olarak kalan ABD Soğuk Savaş sonrası dönemi "Yenidünya düzeni" olarak tanımlamıştır. Fakat ABD, Soğuk Savaş Sonrası dönemi "yenidünya düzeni" olarak tanımlarken diğer yükselen Çin. Hindistan, Brezilya gibi güçleri dikkati almamış olması, ABD'nin yeni dönemi tanımlamasında büyük bir eksiklik olduğunu zaman bize göstermiştir. Soğuk Savaş Sonrası'nda dünya güç dengesinin Atlantik'ten Pasifik'e kayması da "yeni dünya düzeni"nin farklı bir düzen olacağının işaretlerini vermektedir (Kissinger, 2008, Ekrem, 2010).

Bu çalışma Ticari Beklentiler teorisi çerçevesinde uluslararası ilişkiler konteksi içerisinde Çin'in barışçıl yükselişinin iç ve dış dinamiklerini analiz etmektedir. Ayrıca bu çalışma, Çin yükselişinin uluslararası sistem için bir tehdit olup olmadığını analiz edebilmek için ekonomi ve politika ilişkisinin iyi analiz edilmesi gerektiğini savunmaktadır. Bu çalışma iki ana bölümden oluşmaktadır. Çalışmanın ilk bölümünde uluslararası ilişkilerin liberal ve realist yaklaşımları çerçevesinde karşılıklı bağımlılığın aktörlerin (özellikle devletler) davranışlarını nasıl etkilediği incelenecektir. Ayrıca realist ve liberalizm teorilerine ek olarak ayrıntılı olarak "ticari beklentiler teorisi" (trade expectations theory) karşılıklı bağımlılık durumunda aktörler arası çatışma olasılığı hangi durumlarda arttığının ve azaldığının analizini yapmak için kullanılacaktır. İkinci bölümde ise birinci bölümde ayrıntılı bir şekilde incelediğimiz uluslararası ilişkiler teorileri üzerinden Çin'in barışçıl yükselişi karşılıklı bağımlılık bağlamında ele alınacaktır. Bu yöntemle Çin'in yükselişinin uluslararası sisteme tehdit olup olmadığı sonucuna ulaşılmaya çalışılacaktır. Bu çalışma, kullanılan yöntem ve örnek olay (case study) karşılıklı olarak karşılıklı bağımlılığın ve ticari beklentilerin Çin'in yükselişinin analiz edilmesinde ne kadar etkin olduğunu da ortaya koyabilmesi açısından da önem arz etmektedir. Ayrıca bu çalışma, Çin'in içerisinde bulunduğu mevcut karşılıklı bağımlılık bağlamında gelecekteki ticari beklentilerinin olumlu olmasının Çin'in sistem içerisinde bir tehdit olarak ortaya çıkmasının önünde bir engel olduğunu savunmaktadır.

## 2   Savaş ve Ekonomik Karşılıklı Bağımlılık Üzerine Teorik Bir Tartışma

Karşılıklı Bağımlılık her bir bakış açısı tarafından ideolojik olduğu kadar analitik olarak da tanımlanmaktadır. Joseph S. Nye yaptığı "Interdependence and Power" isimli çalışmasında karşılıklı bağımlılığı analitik olarak şöyle tanımlamaktadır; "karşılıklı bağımlılık, sistemin farklı yerlerinde olayların ve aktörlerin birbirini etkilemesidir. Ya da daha basitçe karşılıklı bağımlılık ortak bağımlılıktır." (Nye, 2003:191). Karşılıklı bağımlılık aktörler arasında işbirliğine yol açabileceği gibi ihtilafa da yol açabilmektedir. Joseph S. Nye ile karşılıklı bağımlılık üzerine ortak çalışmalar yapmış olan Robert Keohane işbirliğini "bir politika koordinasyon sürecinde, aktörlerin davranışlarını diğerlerinin mevcut veya olması muhtemel durumunu dikkate alarak belirlemesi" olarak tanımlamaktadır (Keohane, 1984:51, Gürkaynak, 2009:75-76). Keohane'nin işbirliği tanımı iki önemli unsur içermektedir. Bunlardan ilki her aktörün bazı hedefleri vardır, ikincisi işbirliği aktörlere ödül kazandırmakta ve fayda sağlamaktadır. Bu durumda buradaki can alıcı nokta aktörler hangi koşullarda devletler işbirliği yapmak isteyecektir.

Uluslararası ilişkilerin liberal yaklaşımına göre, ticaret her devlete büyük faydalar sağladığından bağımlı devletler ticaret yaptıkları devletlerle herhangi bir savaşa ya da çatışmaya girmekten kaçınırlar. Barışçıl ticaretin devletlerarasında oluşturduğu yakın ilişkiler onların savaş riskinden ve maliyetinden kaçınmalarını sağlar (Copeland, 1996:8). Richard Rosecrance göre, sistem yüksek düzeyde bağımlı olduğunda "ticaret yapan devletler için çatışmaya girerek toprak elde etmektense dünya ticari pazarının onun ürünleri ve hizmetleri için yarattığı fırsatları tercih ederek iç ekonomik gelişimini sağlamak ister." (Rosecrance, 1986:13-14, Rosecrance, 1989:48-57). Bu durumda yüksek düzeyde karşılıklı bağımlılığı olan devletlerin savaş isteği de kaybolacaktır.

Diğer taraftan, uluslararası ilişkilerin realist yaklaşımına göre ise, karşılıklı bağımlılık sadece barışı sağlamaz aynı zamanda savaş olasılığını arttırmaktadır (Copeland, 1996:10). Herhangi bir kriz durumunda elzem ithal ürünlerin akışının kesilme ihtimali olduğu için devletler bağımlı olmaktan hoşlanmazlar. Realist yaklaşımın önde gelen savunucularından Kenneth Waltz ve John Mearsheimer uluslararası politikanın anarşik yapısı nedeniyle devletler kırılganlıkları (vulnerability) konusunda hassaslaşmaktadırlar. Bundan dolayı devletler kırılganlıklarını azaltmak amacıyla karşılıklı bağımlılığı ya kontrol etmek ya da bağımlılıklarını azaltmak isterler (Gürkaynak, 2009:84). Aksi takdirde oluşabilecek asimetrik bir karşılıklı bağımlılık durumda avantajlı konumda olan taraf bu durumu dezavantajlı olan tarafa karşı bir politik araç olarak kullanabilir (Copeland, 1996:10). Yukarıda bahsedilen nedenlerden dolayı, realistler karşılıklı bağımlılığın güvenlik sorununa ve aktörler arası daha fazla uyumsuzluğa yol açma ihtimalini yükselteceği görüşünde olduklarından dolayı karşılıklı bağımlılığa büyük bir tereddütle yaklaşmaktadırlar.

Karşılıklı bağımlılığa uluslararası ilişkilerin liberal ve realist yaklaşımının yanında bu iki yaklaşımı tamamlar nitelikte olan bir üçüncü yaklaşım olarak ticari beklentiler teorisi (trade expectations theory) karşımıza çıkmaktadır. Ticari beklentiler teorisinin, karşılıklı bağımlılığa bakışı diğer teorilere göre daha kapsamlı olduğu görünmektedir. Ticari beklentiler teorisi asimetrik karşılıklı bağımlılığı, uluslararası sistemin etkilerini, devletlerin ve karar alıcıların algılarını, karar alıcıların karakteristiğini ve en önemlisi bunlarında bir toplamı

olacak şekilde, aktörün gelecekten beklentisini iyimser mi yoksa kötümser mi olduğunu ayrıntılı olarak analiz etmeye çalışmaktadır.

Liberal yaklaşımın karşılıklı bağımlılığa bakışına göre, Birinci Dünya Savaşı öncesi Fransa, İngiltere ve Almanya arasında mevcut olan yüksek karşılıklı bağımlılıktan ve ticari ilişkiden dolayı savaşın patlak vermemesi gerekirdi. Birinci Dünya Savaşı'nın yüksek karşılıklı bağımlılık ve ticari ilişkinin yoğunluğuna rağmen çıkmış olması liberal yaklaşımı bir sorunla karşı karşıya getirmektedir. Birinci Dünya Savaşı 1914'de patlak vermeden önce, Avrupa'nın üç büyük gücünden Almanya'nın toplam ticareti GSYH'sinin (gross national product) yüzde 38'i, İngiltere'nin toplam ticareti GSYH'sinin yüzde 52'si ve Fransa'nın toplam ticareti GSYH'sinin yüzde 54'üne eşitti. Aynı zamanda bu üç büyük güç ticaretlerini ağırlıklı olarak birbirleri arasında yapmaktaydılar (Papayoanou, 1996:54). Fakat I. Dünya Savaşı öncesi var olan bu kadar yoğun ticarete ve karşılıklı bağımlılığa rağmen Almanya'nın büyük güç olarak çıkmaya başlaması ve belirli bir seviyeye ulaşması savaşı tetiklemiştir. I. Dünya Savaşı öncesi uluslararası sisteme bakıldığında İngiltere ve Fransa'nın büyük güçler olarak dünyayı kolonileştirdikleri ve hegemonik bir yapı inşa ettikleri görülmektedir. Yüksek karşılıklı bağımlılığa rağmen İngiltere ve Fransa ekseninde kurulan güç dengesinin bozulmaya başlaması, büyük güçler arasında eşitsiz dağılmış koloni alanları savaşa neden olmuştur. Başta Almanya olmak üzere siyasi birliğini ve endüstrileşme sürecini Fransa ve İngiltere'ye göre daha geç tamamlamış büyük güç adayları endüstrinin temeli olan hammaddeye olan ihtiyaçlarını, daha önceki süreçte dünyayı kendi çıkarlarına göre sömürge alanlarına ayıran güçler nedeniyle, karşılama sorunuyla karşı karşıya kalmışlardır. Yeni büyük güç olarak ortaya çıkan Almanya ekonomik gelişiminin ve büyük güç olma sürecinin devam edebilmesi için kendisinin bir hayat sahasına (lebensraum) ihtiyacı olduğunu düşünmekteydi. Bunun yanı sıra yeni ortaya çıkan ve mevcut güçlerin bu yeni duruma olumsuz yaklaşmaları mevcut uluslararası sistemi hızla çatışmaya sürüklemiştir. Paul A. Papayoanou karşılıklı bağımlılığın İngiltere ve Almanya'nın güç dengeleri stratejileri üzerinde büyük bir etkisinin olduğunu ve bununda savaşa neden olduğunu ifade etmektedir (Papayoanou, 1996:42). İlginç bir şekilde I. Dünya Savaşı'nın bir nedeni olan büyük güçler arasında kaynakların eşitsiz dağıtımı, I. Dünya Savaşı'ndan sonra da yeniden aynı güçlerin arasında II. Dünya Savaşı'nın patlak vermesine neden olmuştur.

Dale C. Copeland ticari beklentiler teorisinin liberalizmin ve realizmin karşılıklı bağımlılığa yaklaşımlarında açık kalan alanları tamamladığını vurgulamaktadır (Copeland, 1996:16). Copeland, realizmin ve liberalizmin karşılıklı bağımlılığı değerlendirirken rasyonel karar alıcıların gelecek ticari beklentileri üzerinden barış ve savaş arasında bir secim yapacaklarını göz ardı ettiğini ifade etmektedir (Copeland, 1996:16). Ticari beklentiler teorisine göre, eğer devletlerarasında yüksek düzeyde bağımlılık varsa ve devletlerin gelecek ticari beklentileri olumsuz ise, devletlerin savaşa girme eğilimleri artacaktır. Diğer taraftan devletlerarasında yüksek düzeyde bağımlılık olmasına rağmen, gelecek ticari beklentileri olumlu ise devletlerarasında çatışma olasılığı azalacaktır. Dolayısıyla devletlerin yüksek düzeyde bağımlı oldukları durumlarda esas belirleyici olan geleceğe yönelik beklentileridir (Copeland, 1996:16-26). Yukarıda da tartışıldığı üzere Almanya'nın I. Dünya Savaşı öncesi politikasını açıklamakta ticari beklentiler teorisi liberalizm ve realizmden daha etkili olduğu söylenebilir. I. Dünya Savaşı öncesinde büyük güçlerin gölgesinde kalan Almanya gelecekteki ekonomik ve siyasi gelişimini sürdürülebilir görmemekteydi. Diğer bir örnekte Irak lideri Saddam Hüseyin'in 1990 yılında Kuveyt'i işgalidir. Irak ve Kuveyt arasındaki asimetrik karşılıklı bağımlılıktan cesaret alan Irak, savaş maliyetinin getirisinden daha düşük olacağı beklentisi içerisinde Kuveyt'e saldırmıştır. Fakat uluslararası sistemin yapısını dikkate almadığından Irak için bu işgal oldukça pahalıya mal olmuştur.

Karşılıklı bağımlılık hem liberallerin belirttiği üzere barışı sağlayabildiği kadar realistlerin iddia ettiği gibi savaşa da yol açabilmektedir. Karşılıklı bağımlılıkta özellikle yüksek düzeyli karşılıklı bağımlılıkta aktörlerin geleceğe yönelik beklentileri aktörlerin işbirliğine ya da çatışmaya yönelmelerinde esas rolü oynadığını yukarıda belirttiğimiz tarihi olaylar bize göstermektedir. Özellikle aktörlerden birisi ya da her ikisinin sistemi etkileyecek kadar güçlü olmaları durumu daha da kritikleştirmektedir.

## 3   Karşılıklı Bağımlılığın Çin'in "Barışçıl Yükselişine" Uygulanması

Bu bölümde, karşılıklı bağımlılık konteksi içerisinde Çin'in yükselişinin mevcut uluslararası sisteme tehdit olup olmadığı tartışmaları ticari beklentiler teorisi dikkate alınarak analiz edilmektedir. Bu yöntem Çin'in yükselişi artan karşılıklı bağımlılık durumunda işbirliğine mi yoksa çatışmaya mı yol açacağını açıklamak için kullanılacaktır.

Güç geçişi teorisinin (Power transition theory) ana tartışma konusu olan yükselen güç ile mevcut hegemon güç arasındaki güç boşluğunun kapanmaya başladığında güçlerin nasıl bir strateji izleyeceklerdir. Eğer yükselen güç mevcut uluslararası sistemden ve onun kurumlarından çok fazla memnun değilse çatışma olasılığı artacaktır. Bu teoriyi savunan çoğu uzman tarihten ampirik kanıtlarla yükselen Çin'in mevcut uluslararası sisteme tehdit oluşturmakta olduğunu savunmaktadırlar. Gerçekten de tarihi sürece bakıldığında Napolyon Fransa'sı, I. Dünya Savaşı öncesinde Wilhelm Almanya'sı ve yine II. Dünya Savaşı öncesinde Almanya ve Japonya büyük güç olarak tarih sahnesine çıkarken mevcut uluslararası sistemi tehdit etmişler ve mevcut hegemon güçler ile çatışmaya girmişlerdir. II. Dünya Savaşı sırasında Nazi Almanya'sına karşı hegemon güçlerle ittifak yapan

Sovyetler Birliği'de belirli bir potansiyel gücü ele geçirdikten sonra uluslararası sistem ve onun kurumlarıyla çatışmaya başlamıştır.

Napolyon Fransa'sı, Wilhelm ve Nazi Almanya'sı, Japon İmparatorluğu büyük güç olarak ortaya çıkarken uluslararası sisteme meydan okurken izledikleri stratejiyi Çin'in de izleyip izlemeyeceği bir sorun olarak son yirmi yıldır tartışılmaktadır. Çin'in 1978'de Deng Xiaoping önderliğinde başlayan ve 30 yıldır devam eden ekonomik gelişimi günümüzde göz kamaştırıcı bir hal almıştır. Mevcut uluslararası sistem 19. ve 20. yy.dan tamamen farklı bir yapıya kavuşmuştur. Küreselleşen dünyada mevcut uluslararası sistemdeki aktörlerin (yükselen Çin başta olmak üzere) davranışlarını açıklayabilecek en güçlü argümanlar arasında karşılıklı bağımlılık teorisi yer almaktadır.

Çin, ABD gibi güçlü bir hegemon var iken hegemonluk iddiasında bulunmaktan şiddetle kaçınmaktadır. 1978'den itibaren izlediği ekonomi ağırlıklı dış politika stratejileri de bunu kanıtlar mahiyettedir (Yılmaz, 2008:83). Çin'in tehdit oluşturduğunu savunan uzmanların ana argümanları, Çin'in askeri harcamalarındaki artışından, Çin Komünist Partisi'nin yönetim sekli ve değerlerinden ve offensive realistlerin sıkça vurguladığı büyük güçler büyük güç gibi davranır değerlendirmesinden oluşmaktadır (Roy, 1996:759-767). Offensive realist okulun önde gelen savunucularından John Mearsheimer, her büyük gücün nihai amacının dünya güç dağılımındaki payını arttırmak ve sistemi domine etmek olduğunu belirtmektedir (Mearsheimer-Brzezinki, 2005). John Mearshimer'e göre eğer Çin ekonomik yükselişini gelecek on yılda da bu şekilde devam ettirebilirse, ABD'ye potansiyel bir tehdit olarak ortaya çıkacaktır. Dolayısıyla Çin'in barışçıl yükselişi mümkün değildir (Mearsheimer-Brzezinki, 2005). Fakat John Mearshimer ve Çin tehdidi vurgusu yapan uzmanlar, uluslararası sistemin yapısını ve Çin'in yükselişinin dinamiklerini göz ardı etmektedir. Çin'i tehdit olarak gören uzmanların aksine, bazı uzmanlarda Çin'in tarihte ve son 30 yılda mevcut sistemle uyumlu bir politika izlediğini, askeri harcamalarının diğer büyük güçlerle kıyaslandığında aşırı olmadığını, Çin karşıtı bir önyargının varlığı gibi argümanlarla Çin'in uluslararası sisteme bir tehdit oluşturmadığını savunmaktadırlar (Roy, 1996:759-767).

Çin'in tehdit olduğu (zhongguo weixie lun中国威胁论) argümanlarına karşı Çin tarafı da kendi savunma argümanlarını geliştirmektedir. 2003 yılında Boao Forum'da ilk defa Çinli akademisyen Zheng Bijian tarafından "Çin'in Barışçıl Yükselişi" (zhongguo heping jueqi中) kavramı literatüre kazandırılmıştır (Xinhua, 2004). Kısaca Çin'in Barışçıl Yükselişi, Çin tarihteki diğer yükselen ve mevcut sisteme meydan okuyan güçlerden farklı bir yol izlemekte ve mevcut dünya düzenine tehdit oluşturmadan entegre olmak istemektedir şeklinde Zheng Bijian tarafından tanımlanmaktadır. Ayrıca Zheng Bijian'in ifadelerine göre Çin karşılıklı bağımlılık oluşturmak istemektedir ve bunu da desteklemektedir. Artan karşılıklı bağımlılık Çin'i daha fazla ekonomik ve güvenlik alanında işbirliğine yöneltecektir (Zheng, 2002). Bu kavramın ve görüşlerin Çinli karar alıcılar tarafından da kabul edildiği görülmektedir. 1978 sonrası Çin'in dış politikasının, kendinden önceki yükselen güçlerin aksine sert güç üzerinden değil, yumuşak güç üzerinden şekillendirilmesinin daha rasyonel bir yaklaşım olduğu gözlemlenmektedir (Demirtepe, 2013:105-107).

## 4   Çin ve Ekonomik Karşılıklı Bağımlılık

Şüphesiz olumlu ve olumsuz olarak karşılıklı ekonomik bağımlılık insanlık tarihi boyunca insanlar arasında önemli bir rol oynamaktadır. Karşılıklı bağımlılık konusunda çalışmaları olan Joseph Nye, karşılıklı bağımlılığın maliyet ve değer üzerinden bir politika seçimi olduğunu, yüksek derecede sosyal ve özellikle algısal bir orijininin olduğunu ifade etmektedir (Nye, 2003:191). Bu değerlendirme 1978'de ekonomik reformları başlatan ve bu tarihten itibaren ekonomik gelişimini ihracat üzerine inşa eden Çin için de geçerlidir. Çin ekonomik gelişimi ile ortaya çıkan karşılıklı bağımlılık nedeniyle 1949-1978 arasında izlediği politikayı 1978'den sonra değiştirmek zorunda kalmıştır. Diğer bir ifade ile maliyet ve değer üzerinden bir politika seçimi yapmıştır. Ayrıca bu politik seçimin hem algısal hem de sosyal kökenini Çin bağlamında da görmek mümkündür.

Çin 1978'de ekonomik reformlara başladığından itibaren, Çin hızla dünyanın üretim merkezi olma yönünde ilerlemiştir. Çin hakkında bazı ekonomik istatistiklere bakıldığında Çin'in dünya üretim merkezi olduğu ve oluşan karşılıklı bağımlılık daha iyi anlaşılacaktır. İstatistiklere bakıldığında 2013 yılı rakamlarına göre, Çin 2,077 trilyon ABD dolarlık ihracatı ve 1,830 trilyon ABD doları ithalatı ile ithalat ve ihracatta toplam ticaret hacmi 3,907 trilyon ABD dolarına ulaşmıştır. Ayrıca 2012 yılına göre 2013 yılında Çin, yaklaşık 20 milyar ABD doları daha fazla ticaret fazlası vermiş ve toplam ticaret fazlası 247 milyar ABD dolarına ulaşmıştır. Dünya üretim merkezi haline gelen Çin'in dış ticareti pozitif yönde gelişmektedir. 2013 yılı rakamlarına göre Çin'in en büyük ticaret hacmine sahip olduğu ülkeler sırasıyla ABD (521 milyar dolar), Hong Kong (401 milyar dolar), Japonya (312 milyar dolar), Güney Kore (274 milyar dolar), Tayvan (197 milyar dolar), Almanya (161 milyar dolar), şeklinde sıralanmaktadır (中华人民共和国海关总署). Çin'in en büyük ticari ortağı olan ABD ile arasındaki ticaret hacmi 561 milyar ABD doları civarındadır. Bunun diğer anlamı Çin toplam ticaretinin 1/7'ini sadece ABD ile yapmaktadır. Ayrıca, Çin-ABD arasındaki ticarette 2013 yılında ABD 318 milyar ABD doları açık vermiştir.(CENSUS). Sadece Çin-ABD arasındaki ticarette dahi Çin ile ABD arasındaki karşılıklı bağımlılığın yüksek düzeyini görmek mümkündür. İthalat-ihracatı dışında Çin'in 2013 yılında çektiği doğrudan

yabancı yatırımların (FDI) miktarı 117 milyar ABD dolarıdır (Xinhuanet, 2014). Çin'e gelen doğrudan yabancı yatırımların kaynağı ise sırasıyla Hong Kong, Japonya, ABD ve Tayvan'dır. Hong Kong dışında Çin'e en çok doğrudan yabancı yatırımı yapan Japonya, ABD, Tayvan ile Çin arasında tarihsel ve diğer nedenlerden dolayı ciddi politik sorunlar olmasına rağmen ekonomik ilişkilerin bu derece yakın olması ayrıca dikkat çekici bir durumdur. Kısa ve orta vadede mevcut bu durumun değişmesi beklenmemekte, tam aksine artarak devam etmesi yönünde işaretler daha baskındır. Hem Çin tarafının hem de diğer aktörlerin bu ticaret rakamlarına rağmen bir "kaybet-kaybet" ile sonuçlanması yüksek derecede muhtemel bir çatışmaya yönelmeleri beklemek rasyonel değildir. Ayrıca Çin'in artan ekonomik karşılıklı bağımlılığına bağlı olarak yükselen ekonomisi, Çin'in uluslararası sistemle daha fazla entegre olmasını sağlayacaktır (Gürkaynak, 2009:89).

Ayrıca yükselen ve "tehdit" oluşturan Çin açısından bakıldığında aşağıdaki her üç şekilde de kısa ve orta vadedeki ekonomik gelişmeler Çin'in lehine olacağı yönündedir. Çin'in ithalatı (Şekil 2), ihracatına (Şekil 1) kıyaslandığında daha fazla oranda artmasına rağmen ikisi de artan oranda artmaktadır. Ayrıca Çin'in ithalatının ihracatına göre daha fazla oranda artmasının nedenleri arasında zenginleşen Çin'in daha fazla lüks tüketime yönelmesidir. Şekil 3'de de görüldüğü üzere Çin'in ticaret dengesi düşük oranda da olsa artmaktadır. Gelecekte de Çin'in ticaret dengesinin uzun yıllar Çin'in lehine devam etmesi sürpriz olmayacaktır. Bu üç şeklin de gösterdiği üzere Çin'in mevcut ticari dengeleri ve geleceğe yönelik ticari beklentileri Çin'in lehine olmaya devam edecektir.

***Şekil 3*** *Çin'in Ticaret Dengesi (2000-2014)* ***Kaynak:*** *Trading Economics*

Mart 2014 tarihi itibariyle de, Çin'in döviz rezervleri 3 trilyon ABD dolarına ulaşmıştır. Bu döviz rezervlerinin çoğu Çin'in ABD'den almış olduğu hazine bonolarından oluşmaktadır. Bunun diğer bir anlamı Çin sık sık politik sorunlar yaşadığı ya da meydan okuyacağı düşünülen ABD'nin bütçe açıklarını finanse etmektedir. Çin-ABD arasında var olan bu karşılıklı bağımlılık durumunu sembiyotik karşılıklı bağımlılık olarak ifade edilebilir. 2000 yılında Çin'in önde gelen üniversitelerinden Tsinghua Üniversitesi'nin Yönetim Okulu onursal dekanı Zhu Rongji'nin bir konferansı sırasında, bir öğrencinin "Çin için en büyük güvenlik tehdidi nedir?" sorusuna "ABD ekonomisinde yaşanabilecek bir kırılma/kriz" cevabını vermesi mevcut karşılıklı bağımlılığı göstermesi açısından oldukça manidardır (Carnegiecouncil). Zhu Rongji'nin cevabından da anlaşılabileceği üzere 19. ve 20. yy. ortaya çıkan büyük güç adaylarından farklı olarak 21. yy.'da büyük güç adayı olarak ortaya çıkan Çin gibi ülkeler, uluslararası sistemdeki en büyük ve başat hegemon güçte oluşacak bir krizi dahi oluşan karşılıklı bağımlılık nedeniyle kendilerine bir tehdit olarak algılamaları siyasi krizlere ve sorunlara rağmen bir çatışmanın çıkmasının önünde büyük bir engel olarak durmaktadır. Bu oluşan durum tarihi tecrübelerinde gösterdiği gibi hem iki güç hem de uluslararası sistem için iyiye işarettir. Aynı zamanda Çin-ABD arasındaki karşılıklı bağımlılık nedeniyle göreceli olarak daha güçsüz olan Çin, daha güçlü olan ABD'nin ekonomik ve politik baskılarına dayanabilmektedir.

Philip C. Saunders Çin'in iç politikasının dış politikasını bağımlılık anlamında etkilediğini ifade etmektedir. Philip C. Saunders'e göre, Çin'in mevcut sosyo-ekonomik yapısı Çinli karar alıcıları bağımlılığa sıcak yaklaşmaları konusunda cesaretlendirdiği ve bu yolla sosyal istikrarın sağlanmasının hedeflendiğini söylemektedir (Saunders, 2000:75). Philip Saunders'inde yukarıda belirttiği üzere ekonomik reformlar ve gelişim Çin'in toplumsal dinamiklerini köklü bir şekilde değiştirmiştir. Toplumsal dinamiklerdeki bu değişim nedeniyle Çin'in ekonomik istikrarı ile sosyal istikrarı arasında daha derin bir ilişki ortaya çıkmıştır. Özellikle ekonomik reformlar nedeniyle gerçekleştirilen kamulaştırmalar, kırsal kesimde sanayileşme nedeniyle ortaya çıkan sorunlardan dolayı bölge insanının kolektif isyanlara yöneldiği görülmektedir. Bilindiği üzere Çin'in toplam köylü nüfusu hala 800 milyon civarında ve toplam nüfustaki payı yüzde 60'a yakındır. Bu durumda Çin için ciddi bir tehdit olarak ortaya çıkmaktadır. Resmi istatistiklere göre, 1993 yılında gerçekleşen kolektif olaylar/isyanlar 8706 iken 2005 yılında on kat artmış ve 87000'e çıkmıştır. Bu olayların yüzde 40'ı kırsal kesimde gerçekleşmektedir (Yu, 2005:5). Ayrıca 100 milyondan fazla çiftçi endüstrileşme sürecinde kırsal kesimden şehirlere işçi olarak transfer olmuştur (Yu, 2005:5).

Çin ve Japonya arasında tarihte trajik olaylar vuku bulmuş olmasına ve halen politik olarak ciddi sorunlar var olmasına rağmen, bu iki güç arasında ciddi bir ekonomik karşılıklı bağımlılık oluşmuştur. Japonya Çin'de 46,1 milyar Amerikan Doları ile en büyük üçüncü yabancı yatırımcı olmasının yanında Çin ve Japonya arasında 350 milyar ABD doları civarındaki ticaret hacmi ile birbirinin en büyük ticari ortaklarındandır (Richardson, 2012). Ayrıca Japonya'nın 45000'den fazla denizaşırı girişimlerinin yüzde 62'si Çin'de yer almaktadır. Çin'deki Japon yatırımlarında bir milyondan fazla Çinli istihdam edilmektedir (Jian, 2007:260). Genellikle iki ülke arasında ekonomik ve politik ilişkiler arasında net bir ayrım yapmak çok mümkün olmasa da, Çin ve Japonya ilişkilerinde bu ayrımı yapmak mümkündür. Çin-Japonya ilişkileri "ekonomik olarak yakın, politik olarak soğuk" (politically cold yet economically hot) olarak tanımlanmaktadır. Dünyanın ikinci ve üçüncü en büyük ekonomileri olan Çin-Japonya ilişkileri tarihsel geçmişi nedeniyle oldukça "duygusal" bir nitelikte olması, ayrıca ekonomik ve politik büyüklükleri nedeniyle aralarındaki sorunların dünyayı etkileme kapasitesinin büyük olmasından dolayı Çin-Japon ilişkileri dünya politikasında ayrı bir yeri vardır. Yükselen Çin'in iki büyük komşusu olan Hindistan ve Japonya ile sorunları vardır. Japonya-Çin-Hindistan üçlüsünün arasındaki ilişkiye bakılınca 19. yy. Bismarck Almanyasi'nı hatırlatmaktadır. 1871-1890 yılları arasında Almanya Başbakanı olan Otto von Bismarck'ın dış politikası Almanya'nın iki büyük komşusu olan Fransa ve Rusya ile hiçbir zaman aynı zamanda düşman olmama

ilkesi üzerineydi. Fakat Bismarck sonrası dönemde Kayser Wilhelm II'nin Bismarck'ın dış politika prensiplerini terk etmesi sonucu hem Fransa hem de Rusya ile aynı anda düşman olması Almanya'nın zararına olmuştur. Çin içinde Asya denkleminde aynı pozisyondan bahsedilebilir. Çünkü Hindistan'ın Hint Okyanusu'nda artan etkinliği Çin'in enerji güvenliğini tehdit edebilecek pozisyonda iken Japonya'nın da hem Çin ile olan büyük hacimli ticareti ve Çin'deki yatırımları hem de Doğu Asya'da ve Doğu Asya denizlerinde çıkacak bir kriz Çin için bir yıkım getirebilecek konumdadır. Zheng Bijian I. Dünya Savaşı öncesi Almanya'nın ve II. Dünya Savaşı öncesi Japonya ve Almanya'nın memnun olmadıkları dünya politikasına oldukça agresif yaklaştıklarını ve savaşa neden olduklarını, fakat Çin'in yükselişinin bunlardan farklı olacağını deklare etmektedir (Zheng, 2002). Çin karar alıcıların farklı mekânlarda ve zamanlarda yaptıkları açıklamalara bakıldığında Zheng Bijian'in ifadeleriyle paralel ifadeler kullandıkları görülmektedir. Çinli liderlerin tarihte büyük güçlerin yaşadıkları trajediden ders aldıkları görülmektedir.

Çin ile Doğu Asya ülkeleri arasında oluşan karşılıklı bağımlılıkta dikkatleri çekmektedir. Doğu Asya ve Çin arasında 20. yy.'da bağımlılık daha fazla olmasına rağmen 1900'lerin ilk çeyreğinden 1980'nin ortalarına kadar yaklaşık elli yıl boyunca karşılıklı bağımlılıkları azalan yönde seyretmiştir (Petri, 2005:11). 19. yy.'da Avrupalı güçler tarafından Doğu Asya'da empoze edilen "Liman Sistem Antlaşması" (Treaty Port System) bölgesel karşılıklı bağımlılığın ortaya çıkmasının ana sürükleyicisi olmuştur (Zheng, 2002). Fakat I. Dünya Savaşı, bölgesel çatışmalar ve II. Dünya Savaşı nedeniyle bölgesel karşılıklı bağımlılık 1980'lerin ortasında Çin ile bölge ülkeleri arasında işbirliği ve ortaklıklar yapılana kadar azalmıştır. Özellikle 1997-1998 yıllarında ortaya çıkan Asya Finans Krizi, Doğu Asya'da bölgesel ekonomik istikrarın artırılması için bölgesel ekonomik işbirliğinin ve entegrasyonun derinleştirilmesinin gerekliliği konusunda büyük bir uyarıcı etki yapmıştır. Doğu Asya'da bölgeselleşmenin olumlu etkileri Çin-ASEAN ülkeleri arasındaki ticarete de yansıdığı görülmektedir. Çin-ASEAN ülkeleri arasındaki ticaret hacmi 1991 yılında 7,96 milyar ABD doları iken 21 yıl içinde 50 kez artarak 2012 yılında 400 milyar ABD dolarına çıkmıştır. Çin-ASEAN ülkeleri arasında ticaret hacminin bu derece hızlı artmasının en önemli nedeni aralarında oluşturdukları serbest ticaret alanlarıdır. Ayrıca karşılıklı yatırımlar 100 milyar ABD dolarına ulaşmıştır (Peopledaily, 2013中华人民共和国中央人民政). Çin ile ASEAN ülkeleri arasında bire bir ilişkide Çin lehine bir asimetrik karşılıklı bağımlılık söz konusu olmasına rağmen Çin'in bölge ülkelerine yönelik hegemonik üstünlük kurmaya yönelik bir yaklaşımdan çok bölgede yumuşak gücüyle var olmaya çalıştığı görülmektedir. Ayrıca bölgede ABD'nin de olması ASEAN ülkeleri açısından iki büyük gücün arasında ortaya çıkan bölgedeki dengeden oldukça memnun oldukları anlaşılmaktadır. 2003 yılında düzenlenen Bo'ao Forumda Zheng Bijian Çin'in komşu ülkelere yönelik politikasını "yakın komşu uzak akrabadan daha iyidir" (jin lin bu ru qin近邻不如远亲) Çin deyimi ile ifade etmiştir.

Endüstrileşme sonrası bütün yükselen güçler için enerji güvenliği en önemli problemlerden bir tanesi olmuştur. Çin'in yükselişini devam ettirebilmesi için de enerji güvenliği Çin dış politikasının da en önemli önceliklerinden birisi olarak ön plana çıkmaktadır. Zheng Bijian, 2005 yılında Foreign Affairs dergisine yazmış olduğu bir makale de orta düzeyde gelişmiş ve modern Çin'in inşa edilmesi için 45 yıla ihtiyaç olduğunu belirtmektedir. Zheng Bijian'a göre bu 45 yıllık süreçte Çin'in karşı karşıya geleceği en büyük zorluklardan bir tanesi ekonominin ihtiyacı olan hammadde/kaynak teminidir (Zheng, 2005:18-24). Çin'in enerji güvenliğini ve ekonomik gelişimini sağlayabilmesi dünya politikasının istikrarlı olması Çin için öncelikli bir konuma gelmektedir. Sadece dünyadaki siyasi krizlerden dolayı yükselen enerji fiyatları dünyanın ikinci en büyük enerji ithalatçısı olan Çin'i gelişmiş ülkelere göre daha derinden etkilemektedir. 1990'ların başına kadar Doğu Asya'nın en büyük petrol ihracatçısı olan Çin, son yirmi yıldaki hızlı ekonomik büyümesi ile dünyanın en büyük ikinci petrol ithalatçısı konumuna gelmiştir. Çin, başta Ortadoğu petrolü olmak üzere dünyanın diğer petrol üreticilerine bağımlılığı artarak devam etmektedir (Ersoy, 2012:46). Oil&Gas Journal'e göre 2014 Ocak itibari ile Çin'in kanıtlanmış petrol rezervi 24.4 milyar varildir. Üç sene öncesine göre 4 milyar varillik bir artış söz konusudur. EIA verilerine göre 2013 yılında Çin ülke içerisinde günde 4,5 milyon varil petrol üretimi yapmaktadır. 4.5 milyon varillik üretime karşın günlük tüketimi 2013 rakamlarına göre 10,7 milyon varili bulmaktadır. 2013 yılında 6,2 milyon varil net petrol ithal ederek 6,6 milyon net petrol ithal eden ABD'nin ardından en çok petrol ithal eden ikinci ülke olmuştur. Daha önceki yıla göre günde 400 bin varillik bir petrol tüketim artışı göze çarpmaktadır ki bu oranda tüketimde yüzde 4'lük bir artışa tekabül etmektedir. 2013 yılı rakamlarına göre Çin petrol üretiminden ve tüketiminden kaynaklanan günlük 5,6 milyon varillik ham petrol ithal etmektedir (EIA, 2014). EIA'ya göre 2013'deki petrol tüketimi 2011'e göre günde 400 bin varil daha fazla olduğu hesaplamıştır. 2010 -2012 yılları arasında Çin'in petrol talebindeki artış dünyadaki toplam petrol talebindeki artışın yüzde 40'ına denk gelmektedir (EIA, 2011). 2013 yılı verilerine göre, Çin'in günlük petrol ihtiyacının 2,9 milyon varilini (yüzde 52) Ortadoğu bölgesinden karşılanmaktadır. Çin'in geri kalan petrol talebinin 1,3 milyon varili (yüzde 23) Afrika'dan, 562 bin varili (yüzde 10) Latin Amerika, 129 bin varili (yüzde 2) Asya Pasifik bölgesinden ve 938 bin varili (yüzde 20) dünyanın diğer bölgelerinden karşılanmaktadır (EIA, 2014). 2010'da tükettiği Petrolün yüzde 50'sinden ithal eden Çin, EIA tahminlerine göre 2040 yılında bu oran yüzde 72 düzeyine çıkacaktır.

Yukarıda görüldüğü üzere Çin'in hızlı büyümesi Çin'in enerjide dışarıya bağımlılığını hızla arttırmaktadır. Çin'in ekonomik gelişiminin bir sonucu olarak Orta Doğu, Afrika, Orta Asya ve Latin Amerika bölgeleri ile

arasında ortaya çıkan karşılıklı bağımlılık Çin'i bu bölgelerde aktif bir politika izlemek zorunda bırakmaktadır. Batılı ülkeler, Çin'in Afrika, Ortadoğu, Latin Amerika politikasını insan hakları, demokrasi vs konularını dikkate almadan belirlediğini belirterek eleştirmektedir. Fakat Çin, Batılı ülkelerden farklı olarak Latin Amerika, Ortadoğu ve Afrika ülkeleriyle ortak çıkar esaslı, ülkelerin egemenlik haklarına saygı duyarak, iç işlerine karışmadan ticaret, yatırım ve işbirliği yapmaktadır (Taylor, 2006:939-940). 2000 yılında Çin önderliğinde 44 Afrika ülkesiyle ticareti ve yatırımları daha fazla geliştirmek amacıyla Çin-Afrika İşbirliği Forumu (CACF, China-Africa Cooperation Forum) kurulmuştur. Afrika'nın petrol üreticisi ülkeleri için Çin, Batı pazarına alternatif olarak ortaya çıkmaktadır. Sudan'ın ürettiği petrolün yüzde 65'i Çin pazarına gitmektedir. Bunun yanı sıra Çin, Angola, Sudan ve Kongo'nun en büyük petrol pazarlarından birisidir (Hong, 2007:404). Çin, Arap ülkeleri ile de Afrika ile yaptığının benzeri bir kurum olarak, 2004 yılında Çin ve Arap ülkeleri arasında işbirliğini geliştirmek için Çin-Arap İşbirliği Forumu kurulmuştur. Afrika ve Arap ülkeleri ile kurulan forumlar, Çin'in Afrika'da, Ortadoğu'da kısa ve orta vade diyalog yoluyla bir işbirliği geliştirmek istediğinin, yumuşak gücüyle bu bölgelerde var olmak istediğinin ve hegemonya peşinde koşmak istemediğinin işaretleri olarak görülebilir.

Çin enerji güvenliğine tehdit oluşturan bir diğer faktör Çin'in petrol satın aldığı Afrika'ya ve Ortadoğu'ya coğrafi uzaklığı ve bundan dolayı ortaya çıkan denizyolu güzergâhının güvenliğidir. Çin ekonomisi için hayati öneme sahip enerji güvenliğini tek başına sağlayabilecek güçte değildir. Ayrıca mevcut sistem içerisinde hiçbir aktörün diğer aktörlerle işbirliğini gözardı ederek, tek başına uluslararası boyuttaki çıkarlarını sağlaması neredeyse imkansızdır (Yılmaz, 2008:79-80). Çin'in ithal ettiği petrolün 4/5'i Malaka ve Tayvan Boğazlarından geçmektedir. Malaka ve Tayvan boğazlarının bulunduğu coğrafyada Hindistan, ABD, Japonya, Tayvan gibi Çin'in rakip olarak algıladığı ülkelerin etkin olması Çin'in enerji güvenliğinde bu ülkelere bağımlı hale getirmektedir. Çin Uluslararası İlişkiler Enstitüsü uzmanlarından Zhang Yuncheng, Malaka Boğazı'nın ve Hint Okyanusu'nun başka güçler tarafından kontrol altına alınması halinde, Çin'e petrol akışının kesileceğinin ve bununda Çin'i bir enerji kriziyle karşı karşıya bırakabileceğini ifade etmektedir (Zweig-Bi, 2005:25-38). Özellikle Malaka Boğazı'nı gölgeleyen Hint Okyanusunda bulunan ABD donanması, Diego Garcia adasındaki ABD ve İngiliz varlığı, diğer yandan Hint donanması, Çin'in enerji güvenliğinin ne kadar kırılgan ve diğer güçlere bağımlı olduğunu göstermesi açısından önemlidir.

## 5 Sonuç

Çin'in ekonomik büyümesi Çin'in uluslararası sisteme bağımlılığını arttırmaktadır. Gelinen noktada karşılıklı bağımlılığı, Çin'in ekonomik gelişimi ve dış politikasının ana etkileyici faktörlerinden birisi haline gelmiştir. Yukarıda da ayrıntılı şekilde incelendiği üzere Çin'in dünya ile entegrasyonu ve ticareti Çin lehine artmaktadır. Ayrıca dünyadaki ekonomik durgunluğa ve siyasi krizlere rağmen Çin'in ticari beklentileri pozitif yönde devam etmektedir. Dünyadaki düşük düzeyli ekonomik büyümelere, ekonomik daralmalara ve siyasi krizlere rağmen 2013 yılında Çin'in reel GSMH'sındaki yüzde 7,7'lik büyüme de Çin'in için olumludur. GSMH'daki büyümenin devam etmesinin yanında Çin'in petrol talebinin de artacağı beklentisi aynı zamanda Çin'deki büyümenin de hala eskisi kadar olmasa da yüksek oranlarda seyredeceğinin bir habercisi niteliğindedir. Çinli liderlerde gelecek 50 yıllık planlarına olumlu bakışlarını ve algılarını korumaktadırlar. Çinli liderlerin 50 yıllık gelecek hedefleri üç dönemden oluşmaktadır. İlk dönem geçtiğimiz 10 yıllık dönem olan 2000-2010 yılları arasında Çin'in GSMH'sını iki katına çıkarmaktır. İkinci dönemde 2010-2020 yılları arasında Çin GSMH'sını tekrar iki katına çıkarmayı hedeflemektedir. Üçüncü dönem olan 2020'den 2050 yılına kadar demokratikleşme, refah devleti ve medeni sosyalist bir devlet olma yolunda ilerlemeyi sürdürmek ve bu noktalarda belirli bir düzeye gelebilmek olarak belirlenmiştir (Zheng, 2005, Ekrem, 2011:10-11). Çin'in yukarıda belirtilen hedeflerine ulaşabilmesi için ekonomik gelişimini devam ettirmesi dolayısıyla karşılıklı ekonomik bağımlılığın artması anlamına gelmektedir. Ekonomik gelişimin devam edebilmesi içinde Çin'in istikrarlı ve barışçıl bir dünya politikasına ihtiyacı olduğu açıktır.

Karşılıklı bağımlılığın faydası oyun teorisinde bazen sıfır toplamlı veya sıfır toplamlı olmayan olabilir. Oyun teorisinde Çin'in karşılıklı bağımlılıktaki pozisyonu pozitif sıfır toplamlı bir oyundur. Diğer bir ifade ile eğer daha fazla kaybetmemek de olumlu bir durumsa karşılıklı bağımlılık mevcut sistemde her halükarda fayda sağlamaktadır. Mao Zedong sonrası döneme bakıldığında da Çin, uluslararası sistem ile daha fazla entegre olma yolunda politika izlemektedir. Çinli karar alıcılarda farkında ki Çin'in geleceğini istikrarlı bir dünya belirleyecektir. Mevcut uluslararası sistemde oluşmuş olan karşılıklı bağımlılık yükselen güçler dâhil sistemdeki güçlerin aşırı davranışlarını sınırlandırmaktadır. Karşılıklı bağımlılığının ve ticari beklentilerin kendi lehine olduğunun farkında olan Çin, arasında asimetrik ilişki olan az gelişmiş Afrika ülkeleri arasındaki ilişkide dahi karşılıklı fayda ve kazan-kazan politikası üzerinden bir ilişki geliştirme gayreti içerisindedir. Ortaya çıkacak olan discord ne Çin'in ne de o küçük ülkenin menfaatine olacaktır.

Ayrıca Çin'in yükselişinin barışçıl olup olmayacağına karar verecek olan dünyanın diğer büyük güçleridir. Özellikle ABD'ye Çin'in barışçıl yükselmesinde büyük görevler düşmektedir. Sistemdeki mevcut büyük güçler göreceli olarak uluslararası sistemde güçlerinin ve etkilerinin azaldığını kabul etmek ve ona göre politika belirlemek yerine eski pozisyonlarında ısrar ederlerse dünyanın bir krize (discord) sürüklenme ihtimali yükselir.

Ayrıca, iki Dünya savaşı öncesi sistemde yükselen güçlerin agresif politikaları ve sonuçları ortadadır. Dünya Savaşları öncesi ortaya çıkan güçlerin gelecek beklentilerinin olumlu olmaması onları daha fazla agresifleştirmiştir. Fakat Çin'in geleceğe yönelik beklentileri hala çok olumludur. Bu çalışmada da ortaya konulmaya çalışıldığı üzere Çinli karar alıcıların hem dış dünyanın hem de kendi ülkelerinin zafiyetleri konusunda farkındalıkları oldukça yüksek olduğu görülmektedir. Çin'in yükselişinin ana dinamiği olan dünya ile entegre ve daha fazla ticaret ancak ve ancak istikrarlı ve barışçıl bir dünya ortamında yapmak mümkündür.

## Abstract

While emerging information technologies have been infusing to the production of manufactured goods at higher rate for widespread use of services, with this case, the services sector in terms of production and consumption eliminates the need to have done. Moreover, many service branches have been subject to international trade and more with each year, the share of service trade is increasing in international trade. International service trade with helping to close the technological development gap between developing and developed countries has significant role on economic growth, realization for process of economic development in structural imbalances and accordingly the macroeconomic policy response. International service trade of the country's economic transformation in the process, it is purposed that production function method based on the model is used in the context of traditional and modern service trade on economic growth, to examine the effects and the impacts on direction of the transition economies between 2000 and 2010. For 15 transition economies having satisfied data; the effects of modern and traditional trade in service on growth rate is examined with using panel data analysis. The model shows that accumulation of capital per capita and for representing human capital chosen the received tertiary education enrolment rate, traditional and modern trade in service has significant effect on growth. On the other hand, openness has no significant effect on growth for chosen country group and identified time period. It can be said that policies aimed physical and human capital stock can create significant effect on growth.

## 1 Giriş

İktisat literatürü uzun yıllar boyunca hizmetleri ve hizmet ticaretini analizlerinin dışında bırakmıştır. Bunun temel nedeni hizmetlerin doğası gereği mallardan farklı olmasına rağmen mallarla iç içi kullanılmasıdır. Dolayısıyla uzun yıllar hizmetleri tanımlamak ve sınıflandırmak konusunda iktisatçılar herhangi bir adım atamamışlardır.

Tarihsel süreç içerisinde hizmetleri tanımlayan ilk iktisatçılar fizyokratlardır. Fizyokratlar, hizmetleri tarım dışı ve kısır-üretken olmayan faaliyetler olarak tanımlamışlardır. Kavramsal açıdan mal ve hizmet ayrımı, ilk kez Adam Smith tarafından yapılmıştır. Smith hizmetleri, "somut bir ürünle sonuçlanmayan tüm faaliyetler" ya da "mal dışı faaliyetler" olarak tanımlamıştır. Klasik iktisatçılardan Say ise hizmetleri, "ürünlere fayda ilavesinde bulunan, imalat dışı faaliyetler" kapsamında ele almıştır (Ekinci, 2008). Tanımsal ayırım yapmalarına rağmen, Klasik iktisatçılar genel olarak hizmet ticaretini "verimli olmayan faaliyetler" olarak nitelendirmişlerdir (Ekin, 1996).

Marx verimli emek tanımını yaparken, mal ve hizmet ayrımı üzerinde durmuş; Mill ise, verimli-verimsiz emek ayrımını yaparken, sağlık ve eğitim gibi hizmet sektörlerinde çalışan işçilerin verimli olarak sınıflandırılabileceğini ifade etmiştir. Hizmetleri maddi olmayan mallar olarak nitelendiren Marshall'ın başını çektiği Neo-klasik iktisatçılar ise mal ve hizmet ayrımına fazla önem vermemişlerdir (Mızrak, 2009).

1930'lu yıllarda Clark daha önce yapılan hizmet tanımını değiştirerek, sanayi sektörüne dahil olmayan tüm faaliyetleri hizmetler olarak nitelendirmiş ve hizmet sektörünü tarım ve sanayi sektörüne bağlı olarak değerlendirmiştir. Clark'ın yaptığı tanım çerçevesinde hizmet sektörünün ulusal hasıladaki katkısı, diğer iki sektörden arta kalan pay veya artık olarak düşünülmüştür (Mızrak, 2009). Clark'ın tanımı ile birlikte hizmetlerin ekonomik etkisinin olduğu görüşü -artık yaklaşımıyla da olsa iktisat literatürüne girmiştir (Clark, 1957).

Ekonomik yapıyı incelenirken kullanılan yöntemlerden biri, temel sektörler olan, tarım, endüstri ve hizmet sektörlerinin ekonminin toplam üretiminden ve istihdamından aldıkları payların kıyaslanmasıdır. Clark sektörel gelişim (Üç sektör) modelinde bu yapıdan bahsederken (Clark, 1957); "Toplumlar zamanla, ekonomik açıdan daha fazla gelişirler. Böylece tarım sektöründe istihdam edilenler, sanayi sektöründekilere nazaran; daha sonra da sanayi sektöründe istihdam edilenler, hizmet sektöründekilere nazaran azalma eğilimine girerler" ifadesini kullanmıştır. Gelişmiş ülkeler açısından sektörel gelişim bu aşamaları tamamen yaşasa da, gelişmekte olan ve/veya az gelişmiş ülkeler açısından bahsedilen sürecin her ülkede işlediğini söylemek mümkün değildir. Bu arada iktisadi faaliyetlerde meydana gelen değişmelere bağlı olarak son yıllarda, üç sektör modeline dördüncül ve beşincil sektörler de eklenerek beşli bir sektör ayrımından söz edilebilmektedir. Bu ayrımda üçüncü sektör

enformasyon içerikli olan ve enformasyon içerikli olmayan şeklinde ikiye ayrılarak, enformasyon içerikli olmayan faaliyetler üçüncü sektörü, enformasyon içerikli olanlar dördüncü sektörü oluşturmaktadır (Ekinci, 2008). Dördüncül sektör bilgi teknolojileri, eğitim, Ar-Ge, finans gibi hizmet sektörlerini içermektedir (Selstad, 1990).

Clark'ın öngördüğü üzere 20. yy.'ın başlarında ortaya çıkan ve 20. yy'a hakim olan hizmet toplumu, yerini 20 yy.'ın son çeyreğinde bilgi toplumuna bırakmıştır. Özellikle ulaştırma ve haberleşme alanındaki teknolojik gelişmeler hizmetlerin, uluslararası ticaretteki ve ulusal hasıladaki payını hızla artırmıştır. Çakmak'a göre Nusbaumer, kalbini hizmet sektörünün oluşturduğu bu yeni ekonomik devrimi 18. yüzyılda yaşanan sanayi devrimi ile özdeşleştirmiştir (Çakmak,1996). Hizmetlerin yerel nitelikten çıkarak, uluslararası pazarlarda daha fazla yer bulması, geleneksel hizmet anlayışından bilgi teknolojilerini içeren modern bir hizmet yapısına doğru evrilmeyi gerektirmiştir.

Dördüncül sektör görüşünün benimsediği hizmetlerin modern ve geleneksel hizmetler olarak sınıflandırılması Baumol'ün yaptığı çalışmaya dayanmaktadır. Gelişen teknoloji ile birlikte hizmetlerin doğasının değişmesi ve ticarete konu olan hizmet türlerinin artması üzerine Baumol, 1967 yılındaki çalışmasında hizmetleri, yerel tüketim için yüz yüze etkileşimi gerektiren hizmetler olarak tanımlarken, 1985 yılındaki çalışmasında tanımlamasını değiştirerek, teknoloji içeriği yüksek olan hizmetleri modern gayri şahsi gelişmeye açık hizmetler, teknolojik yeniliğe açık olmayan hizmet gurubunu ise geleneksel hizmetler olarak sınıflandırmıştır(Baumol,1985). ABD Teknolojik Değerlendirme Bürosu Baumol'ün sınıflandırma önerisini benimseyerek, hizmetleri bilgiye dayalı modern ve geleneksel hizmetler şeklinde iki gruba ayırmıştır (Ghani vd., 2010). Ayrıca Wolff, Baumol'un sınıflandırmasını esas alarak, modern hizmetler için gelişmeye açık (proggressive), geleneksel hizmetler için durgun, ilerlemeyen (stagnant) hizmetler ifadelerini benimsemiştir (Wolff, 2002). Modern ve geleneksel hizmetlere ait bu tip bir sınıflandırmanın ülkelerin gelişme düzeyleri açısından bir gösterge niteliğinde olduğu, ayrıca büyüme ve kalkınma açısından bir performans arttırıcı niteliğinde olduğu görülmektedir.

Gelişmekte Olan Ülkelerin (GOÜ) Gelişmiş Ülkelerle (GÜ) arasındaki sanayileşme ve teknolojik gelişmişlik farklarını kapatma çabalarına, yardımcı olan uluslararası hizmet ticareti, ekonomik büyümenin gerçekleştirilmesi, ekonomik kalkınma sürecinde yapısal dengesizliklerin giderilmesi ve buna uygun makro ekonomik politika önlemlerinin oluşturulması açısından büyük önem arz etmektedir (Türkmen,2012). 2012 yılında Doç.Dr. Sevda Yapraklı'nın danışmanlığında Adem Türkmen tarafından hazırlanan "Uluslararası Hizmet Ticareti ve Ekonomik Büyüme: Türkiye Üzerine Ekonometrik Bir Analiz (1974-2011)" isimli yüksek lisans tezinden üretilen bu çalışmada, 15 geçiş ekonomisi için 2000-2010 yıllarını kapsayan dönemde üretim fonksiyonuna dayalı bir büyüme analizi yapılmaktadır. Büyüme analizlerinde sıkça kullanılan sermaye, emek, beşeri sermaye değişkenlerine ilaveten, bu ülke gurubunda hizmet ticaretinin büyüme üzerindeki etkilerini analiz etmek amacıyla modern ve geleneksel hizmet ticareti değişkenleri kullanılmaktadır.

## 2   Literatür

Hizmet sektörünün gelişimi ve daha fazla uluslararası ticarette yer edinmesi ile birlikte, gelişen teorik altyapı, uygulamada da bu konu üzerinde yoğunlaşan çalışmaların artmasına neden olmuştur. Bu bağlamda literatür dikkate alındığında, hizmet/hizmet ticareti ile ekonomik büyüme arasındaki ilişkiyi incelemeyi amaçlayan çalışmalar genellikle hizmet alt sektörleri üzerinde yoğunlaşmaktadır. Bu alt sektörlerden çalışmalarda sıklıkla kullanılan finansal hizmetler ve telekomünikasyon hizmetleri modern hizmetlerin büyüme üzerindeki etkisine dair bir gösterge niteliğindeyken, turizm ve taşımacılık gibi hizmetlerin büyüme üzerindeki etkileri ise geleneksel hizmetlerin büyüme üzerindeki etkilerini göstermektedir.

Az gelişmiş ülkeler (AGÜ) ve GOÜ'ler açısından modern hizmet/hizmet ticareti ile büyüme arasındaki ilişkiye dair literatür incelenecek olduğunda; yapılan ilk çalışmalardan biri King ve Levine ait çalışmadır (King ve Levine, 1993). Çalışmada 77 GOÜ için finansal hizmetlerin uzun dönemde ekonomik büyümeyi pozitif etkilediği sonucu elde edilmiştir. Finansal hizmetleri kullanan diğer çalışmalarda Mattoo vd.(2001), Fasea-Abma (2003), Abu- Bader (2005), Odhimbio (2008), Fung (2009), Nişancı vd. (2011) yaptıkları çalışmalarında finansal hizmetlerin ekonomik büyüme üzerinde pozitif etkisi olduğunu ve özellikle bu alandaki serbestleşmenin de pozitif etkiyi arttıracağını savunmaktadırlar. Ayrıca bu çalışmalarda çıkan ortak sonuçlardan biri de ekonomik büyümenin AGÜ ve GOÜ'lerdeki finansal gelişmeyi destekler nitelikte olduğudur.

Telekomünikasyon hizmetlerinin büyüme üzerinde etkilerini araştıran, Arnold vd. (2007) ve Zebaze-Keck (2009), yaptıkları çalışmalarda telekomünikasyon alt yapısına yapılan eklemelerin büyüme üzerinde pozitif etkisi olduğuna işaret ederken aynı zamanda telekomünikasyon hizmetlerinin etkin kullanılması gerektiğinin de bu pozitif etkiyi arttıracağını belirtmişlerdir.

Sapir ve Lutz (1982) tarafından yapılan çalışmada hizmet ticaretinin GOÜ açısından karşılaştırmalı üstünlük ortaya çıkardığı ve bu sektörde GOÜ tarafından yoğun olarak üretilen hizmetlerin daha fazla ticarete konu olması gerektiği belirtilmiştir. Kreishan (2011), Guatam (2011), Mishra vd. (2011) tarafından GOÜ'lerde

Turizmin ekonomik büyümeye katkısı üzerine yapılan zaman serisi analizlerinde, turizmi ekonomik büyümenin itici gücü olarak nitelendirmişler ve iki değişken arasında çift yönlü ilişkiler tespit etmişlerdir.

Ayrıca çalışmada ülke gurubu olarak seçilen Geçiş ekonomileri üzerine yapılan çalışmalardan Madden-Savage (1998) telekomünikasyon ve altyapı hizmetlerinin, Esenbach (2005) özellikle altyapı hizmetlerinin ekonomik büyümeye olumlu katkılarından bahsetmişlerdir. Fernandes (2008) tarafından yapılan çalışmada ise geçiş ekonomilerinde hizmet sektöründe serbestleşmenin emek verimliliğini arttırıcı etkisi bulgularına ulaşılmıştır.

| Yazar(lar) | Çalışma Yılı | Dönem | Hizmet Değişken(ler)i | Sonuç |
|---|---|---|---|---|
| Sapir- Lutz | 1982 | 1977 | Taşımacılık Hizmetleri | Hizmet ticareti yapabilen ülkelerin ekonomik büyümeleri daha hızlıdır. |
| King-Levine | 1993 | 1960-1989 | Finansal Hizmetler | Uzun dönemde hizmetler ekonomik büyümeyi pozitif etkilemektedir. |
| Madden-Savage | 1998 | 1990-1995 | Telekomünikasyon ve Altyapı Hizmetleri | Hizmetlerle ekonomik büyüme arasında pozitif ilişki vardır. |
| Mattoo vd. | 2001 | 1990-1999 | Telekomünikasyon ve Finansal Hizmetler | Hizmetlerde dışa açık olan ülkeler, olmayanlara göre %1.5 daha hızlı büyümektedirler. |
| Wolff | 2002 | 1947-1997 | Hizmet Alt Sektörleri | Geleneksel ve Modern Hizmetler için TFV, mal endüstrisi TFV'den düşüktür |
| Fasea-Abma | 2003 | 1974-1999 | Finansal hizmetler | Finansal yapıdaki gelişme, ekonomik büyümeyi pozitif etkilemektedir. |
| Abu-Bader-Abu-Qarn | 2005 | 1960-2001 | Finansal Hizmetler DYY'leri | Finansal gelişme, ekonomik büyümeye neden olmaktadır. |
| Eschenbach-Hoekman | 2005 | 1990-2004 | Finansal ve Altyapı Hizmetleri | Hizmetler ekonomik büyümeyi pozitif etkilemektedir. |
| Rutherford vd. | 2005 | 2004 | İşle İlgili Hizmetler | Hizmet sektöründe serbestleşme Rusya'nın refah ve tüketim düzeyinde artışa neden olacaktır. |
| Bayraktar-Wang | 2006 | 1994-2003 | Finansal Hizmetler | Yabancı bankaların varlığı, yerel ekonomilerde ekonomik büyümeye neden olmaktadır. |
| Marquez | 2006 | 1987-2001 | Taşımacılık İthalat ve İhracatı | Hizmet ihracatı, ekonomik büyümeyi hizmet ithalatından daha fazla etkilemektedir. |
| Yang- Yi | 2006 | 1971-2002 | Finansal Hizmetler | Finansal gelişim ve yeniden yapılanma ekonomik büyümeyi pozitif etkilemektedir |
| Arnold vd. | 2007 | 1993-2005 | Bankacılık, Ulaşım, Telekomünikasyon ve Sigortacılık | Hizmet sektörlerindeki reformlar, imalat sektörü verimliliğini pozitif etkilemektedir. |
| Fernandes | 2008 | 1997-2004 | Hizmet Sektörü ve Hizmet Alt Sektörleri | Hizmet sektörlerindeki serbestleşme, emek verimliliğini artırmaktadır. |
| Lee- Chang | 2008 | 1990-2002 | Turizm Hizmetleri | Turizmin büyüme üzerindeki etkisi OECD dışı ülkelerde daha yüksektir. |
| Odhiambo | 2008 | 1969-2005 | Finansal Hizmetler | Ekonomik büyüme, finansal gelişmeye neden olmaktadır. |
| Po- Huang | 2008 | 1995-2005 | Turizm Hizmetleri | Turizmdeki gelişme ile ekonomik büyüme arasında anlamlı pozitif ilişki vardır |
| Fung | 2009 | 1967-2001 | Finansal Hizmetler | Orta ve yüksek gelirli GOÜ'ler arasında, ekonomik büyüme ve finansal gelişme açısından yakınsama vardır. |
| Zebaze- Keck | 2009 | 1997-2003 | Telekomünikasyon Hizmetleri | Mobil ağlara girişteki her %1'lik artış, kişi başı geliri % 0,5 artırmaktadır. |
| Wua vd. | 2010 | 1976-2005 | Bankacılık Hizmetleri | Bankacılık ve hisse senedi piyasasının gelişimi ile ekonomik kalkınma arasında pozitif ilişki vardır. |
| Gautam | 2011 | 1974-2010 | Turizm Hizmetleri | Turizm hizmetleri ile ekonomik büyüme arasında çift yönlü ilişki bulunmaktadır. |
| Kreishan | 2011 | 1970-2009 | Turizm Hizmetleri | Turizm hizmetleri uzun dönemde ekonomik büyümenin kaynağıdır. |
| Mishra vd. | 2011 | 1990-2007 | Hizmet İhracatı | Hizmet ihracatının sofistikasyonu ile kişi başına gelir arasında pozitif bir ilişki vardır. |
| Nişancı vd. | 2011 | | Finansal Hizmetler | Finansal sektörün, ekonomide reel değişkenler üzerinde pozitif etkileri bulunmaktadır. |

*Tablo 1:* *Hizmet/hizmet ticaretiile büyüme arasında yapılan uygulamalı çalışmalar literatür özeti (Türkmen, 2012)*

Uygulamalı literatürde, GÜ'lerde hizmet/hizmet ticareti ile büyüme ilişkisi üzerine, yatay kesit ve panel veri analizi kullanılarak yapılan çalışmaların sayısının çok az olduğu görülmektedir. Sınırlı sayıdaki bu çalışmalardan biri 2002 yılında Wolff tarafından yapılmıştır (Wolff, 2002). Wolff ABD'de 45 mal hizmet alt sektörü üzerine 1947-1997 arasında belli yılları içeren yatay kesit analizine dayalı çalışmasında mal ve hizmet alt sektörlerinde

toplam faktör verimliliğinin gelişimini ölçmeyi amaçlamıştır. Çalışmada geleneksel/durgun hizmet sektörünün 1980 öncesi dönemde toplam faktör verimliliğinin çok düşük olmasına rağmen, faktör verimliliğinin gelişime açık olduğu gözlemlenmiştir. Gelişmeye açık/ modern hizmetlerde 1980 sonrası toplam faktör verimliliğinin düşük sonuçlar göstermesini; yoğun bilgi iletişim teknolojileri kullanımı yüzünden modern hizmetlerin faktör verimliliğinde ölçüm hatalarının varlığına dayandırmıştır.

GÜ'ler üzerine yapılan diğer çalışmalarda, Rutherford (2005) iş ile ilgili hizmetler, Marquez (2006) taşımacılık, Po- Huang (2008) ve Lee-Chang (2008) turizm alt sektörlerini kullanarak, geleneksel hizmet/ hizmet ihracatının ekonomik büyüme üzerinde etkisini düşük ama pozitif olarak bulmuşlardır. Bayraktar-Wang (2006), Wua vd. (2010), Yang Yi (2006) finansal hizmetlerin ve finansal serbestleşme sürecinin ekonomik büyüme üzerinde güçlü pozitif etkileri olduğunu bulmuşlardır. Literatürde yapılan uygulamalı çalışmalara dair özet bilgiler Tablo1'de gösterilmektedir.

## 3 Yöntem ve Uygulama

Bu araştırmanın amacı, 2000-2010 yılları arasında hizmet ticaretinin geçiş ekonomileri üzerindeki etkisini analiz etmektir. Uluslararası literatürde yer alan uygulamalı çalışmalarda, standart ve kapsamlı bir hizmet ölçümü kullanılamadığı gözlenmiştir. Bunun nedeni hizmet ve hizmet ticareti sınıflandırılmaları açısından bir genellemenin bulunmayışıdır (Türkmen, 2012). Bununla birlikte teorik ve uygulamalı çalışmalarda kullanılan, hizmetler ve uluslararası hizmet ticaretini temsil için vekil değişken olarak alınan hizmet alt sektörleri yapıları itibariyle ve teoriye uygun olarak, geleneksel ve modern hizmetler olarak gruplandırılmıştır. Uluslararası literatürdeki genel kabule uygun olarak, bu uygulamadaki analizlerde, ekonomik büyüme ve diğer hizmet unsurları üzerindeki önemi, daha kolay ölçülmesi ve istatistiki veri bulmadaki kolaylıklar nedeniyle UHT göstergesi olarak geçiş ekonomilerinde geleneksel hizmetleri temsilen taşımacılık, turizm, inşaat, kişisel, kültürel ve eğlence hizmetleri; modern hizmetleri temsilen iletişim, bilişim, sigorta ve finans hizmetlerine ait ihracat rakamları kullanılmakta ve ekonomik büyüme değişkeni ile olan ilişkisinin yönü ve büyüklüğü tespit edilmeye çalışılmaktadır.

Çalışmada kullanılan veri seti panel olarak belirlenmiş ve kesit veri aralığı 15 ülke iken, zaman serisi aralığı 2000 ile 2010 olarak belirlenmiştir. Çalışmada kullanılan geçiş ekonomileri veri bulunabilirliği açısından 15 ülke alınmıştır. Bu ülkeler aşağıdaki Tablo 2'de verilmiştir.

| Kodu | Ülke Adı | Kodu | Ülke Adı |
|------|----------|------|----------|
| BGR | Bulgaristan | MDA | Moldova |
| CHN | Çin | MKD | Makedonya |
| CZE | Çek Cumhuriyet | POL | Polonya |
| EST | Estonya | ROM | Romanya |
| HUN | Macaristan | RUS | Rusya |
| KAZ | Kazakistan | SVK | Slovakya |
| LTU | Litvanya | SVN | Slovenya |
| LVA | Latviya | | |

*Tablo 2: çalışmada kullanılan geçiş ekonomileri ve ülke kodları*

Çalışmada kullanılan değişkenler değişkenlere ilişkin açıklamalar Tablo 3'deki gibidir.

| Kısaltımı | Değişkenin Tanımı | Değişkenle ilgili açıklamalar |
|-----------|-------------------|-------------------------------|
| g | Kişi başı GSYİH 2005$ bazlı | GSYİH/ Nüfus |
| op | Ticari Açıklık Oranı | (İhracat+ithalat)/ GSYİH |
| gh | Geleneksel Hizmetler 2005$ bazlı | Geleneksel hizmet ihracatı/ Nüfus |
| mh | Modern Hizmetler 2005$ bazlı | Modern hizmet ihracatı/ Nüfus |
| h | Okullaşma oranı 2005$ bazlı | ISCED 5 ve 6 |
| k | Kişi Başı brüt sermaye birikimi 2005$ bazlı | Brüt sermaye birikimi/ Nüfus |

*Tablo 3: Çalışmada Kullanılan Değişkenler ve Kısaltmaları*

Çalışmada kullanılan veriler Birleşmiş Milletler (UNCTAD Stat) ve Dünya Bankası (World Development Indicators) veri tabanlarından elde edilmiştir.

### 3.1 Analiz

Bu bölümde tahmin yöntemi olarak belirlenen panel veri analizinde kullanılacak olan modellerin tanımlanmakta ve modelde yer alan değişkenler hakkında bilgi verilmektedir. Panel veri analizi belirli bir zaman aralığındaki yatay kesit verilerin kullanılmasıyla ekonomik ilişkilerin tahmin edilme yöntemi olarak tanımlanabilir. Panel veri analizini güçlü kılan en önemli özellik hem zaman hem de birim etkilerin birlikte yer alacağı bir modelleme fırsatı yaratmasıdır. Bunun yanı sıra elbette ki panel veri analizinde de karşımıza daha yüksek olasılıklarla çıkabilecek bir takım ekonometrik varsayım sorunları kaçınılmazdır. Bunlar değişen varyans

ve korelasyon sıkıntılarıdır (Gujarati, 2010). Panel veri analizi kapsamında ele alınan üç farklı model çeşidinden bahsedilebilir. Bunlar havuzlanmış panel, sabit etkiler modeli, rassal etkiler modelleridir. Bu modellerden havuzlanmış panel veri analizinde zaman ve birim etkiler ortadan kalkarak tüm veri seti havuzlanmış olur ve OLS tahmininden sonra elde edilen parametreler bu düzlemde tartışılır. Burada önemli olan bir başka unsur ise, havuzlanmış modelde temel varsayım ele alınan kesit veriler arasında bir farkın olmaması sonucudur. Ayrıca bu model için zaman etkisi de söz konusu değildir (Yardelen, 2012).

İkinci modelleme türü olan sabit etkiler modeli ise eğim katsayılarının zaman ve kesit birimleri için aynı olduğu modellerdir. Bu modellemede yatay kesitler arasındaki farklar kukla değişkenler modele eklenerek ifade edilebilmekte ve bu nedenle sabit etkiler modeli aynı zamanda kukla değişkenler modeli olarak da adlandırılmaktadır. FE modellerde eğim parametreleri $\beta_{2it} = \beta_2$ şekline gelecektir (Yardelen, 2012).

$$Y_{it} = \beta_1 + \beta_2 X_{2it} + \beta_3 X_{3it} + u_{it}$$

Üçüncü ve son modelleme türü olan rassal etkiler ya da rassal etkiler modelidir. Bu modelin sabit etkilerden farkı tıpkı hatalarının rassal olduğu varsayımı gibi yatay kesit verilerindeki birim farklılarında rassal olduğu varsayılmaktadır. Bu modelin sabit etkiler modelinden farkı birim ve zaman farklılıklarının modelin hata teriminin bir bileşeni olarak modelde yer almasıdır (Yardelen, 2012). Panel veri analizinde izlenecek temel yol öncelikle veri setinin eksik olup olmadığının kontrolüdür ki buradan hareketle panelimizin dengeli ya da dengesiz panel olduğuna araştırmacının karar verilmesi gerekmektedir. Eğer veri setinde eksik bilgi söz konusu ise bu dengesiz paneldir; tam bilgi söz konusu ise dengeli panelden söz edilebilmektedir (Baltagi, 1995).

Modelimiz Cobb-Douglas büyüme modeli olarak belirlenmiş ve değişkenler nüfusa oranlanarak modelde yer almıştır.         Q=F(K,L)         $Y = A.L^\beta K^\alpha$

Modeldeki değişkenler büyüme (kişi başına milli gelirlerden elde edilmiş), geleneksel hizmet ihracatı, Üniversite okullaşma oranı, kişi başına sermaye birikimi, kişi başına modern hizmet ihracatı ve ticari açıklık oranı olarak belirlenmiş ve model tam logaritmik olarak aşağıda gösterilmiştir.

$$\log G = \beta_1 + \beta_2 \log GH + \beta_3 \log H + \beta_4 \log MH + \beta_5 \log K + \beta_6 \log OP$$

Model tahmininde öncelikle havuzlanmış model tahmini yapılmıştır ve beklenildiği gibi sonuçlar aşağıda yer almaktadır. Tablo 4'de gösterilen havuzlanmış modelde; geleneksel hizmetler dışındaki parametrelerin %10 anlamlılık düzeyinde istatistiki olarak anlamlı oldukları hipotezi reddedilemez. Fakat modern hizmetlere ait katsayı işaretinin negatif ilişkili olduğu da görülmektedir.

| Değişkenler | Parametre Değeri | Std. Hata | Olasılık Değerleri |
|---|---|---|---|
| C | 0.373 | 0.284 | 0.191 |
| LOG(GH) | 0.020 | 0.041 | 0.632 |
| LOG(H) | 0.401 | 0.059 | 0.000 |

*Tablo 6: Rassal etkiler model*

Havuzlanmış modelin tahmininden sonra sabit etkiler ve rassal etkiler modelleri tahmin edilmiştir. Bu model tahminleri sırasıyla aşağıda Tablo 5 ve 6'da yer almaktadır. Sabit etkiler modelinde ticari açıklık dışında tüm değişkenlerin anlamlı olduğu ve katsayılara ait işaretlerin teorik beklentilere uygun olduğu görülmektedir.

Rassal etkiler modelinde tüm parametreler %1 anlamlılık düzeyinde anlamlı olduğu görülmekte fakat ticari açıklığın büyüme üzerindeki etkisinin negative olduğu gözlenmektedir.

Bu iki modelin spesifik olarak varsayım sınamaları ve parametre anlamlılıklarının incelenmesinden önce Hausmann testi ile hangi modelin en iyi olduğuna karar vermemiz gerekmektedir. Hausmann testinin hipotezleri;

*H₀ : Rassal Etkili Model [ E(αi/xi )= 0 ]*
*Hı : Sabit Etkili Model [ E(αi/xi ) <> 0 ] şeklindedir*

| Test Summary | Chi-Sq. Statistic | Chi-Sq. d.f. | Prob. |
|---|---|---|---|
| Cross-section random | 125.402345 | 5 | 0 |

*Tablo 7: Hausman test sonuçları*

Hausman testi rassal etkiler modelini, sabit etkiler modeline karşı sınamaktadır. Fakat bu testin Baltagi'ye göre istatistiksel güvenilirliği etkili değildir. Baltagi araştırmacının veri analizinde modele karar vermesinin gerekliğini savunmaktadır (Baltagi, 1995). Sabit ekiler modeli belli ülke gruplarının panel veri analizinde kullanılması gereken bir yöntemdir. Yukarıdaki test sonucuna göre $H_1$ hipotezi yani sabit etkiler hipotezi reddedilemez. Hausman test sonuçları ışığında sabit etkiler modeli şu şekilde tahmin edilmiştir.

$$\log G = 5,881 + 0,108 \log GH + 0,095 \log H + 0,244 \log MH + 0,073 \log K - 0,063 \log OP$$

Bu modelde parametrelerin anlamlılıkları t testine göre sınanmıştır. Hipotezler;

*H₀ : βᵢ= 0  (parametre anlamsızdır)*
*Hı : βᵢ ≠ 0 (parametre anlamlıdır)*

Analiz sonuçlarına göre cari açıklık (logOP) dışındaki tüm değişkenlerin parametreleri 0,05 düzeyinde anlamlı olarak tahmin edilmiştir. Buna göre modelin son hali aşağıda belirtilmiştir.

$$\log G = 5,384 + 0,119 \log GH + 0,084 \log H + 0,271 \log MH + 0,061 \log K$$

Modelde yer alan tüm değişkenlerin birlikte anlamlılıklarının sınaması için F testinden yararlanılmaktadır. Bu test için oluşturulan hipotezler;

*H₀ : βᵢ= β₂ᵢ =....= βₙᵢ=0  (parametreler beraber anlamsızdır)*
*Hı : βᵢ≠ β₂ᵢ ≠ ....≠ βₙᵢᵢ ≠ 0 (parametreler beraber anlamlıdır)*

Uygulanan model sonucuna göre modelde yer alan değişkenlerin 0.05 anlamlılık düzeyinde beraber anlamlılıklarını içeren alternatif hipotez reddedilemez sonucuna ulaşılmıştır. Bununla birlikte istatistiki testlerin ardından ekonometrik temel varsayımların testleri incelenmiştir.

Normallik sınaması sonuçlarına göre hata terimleri için oluşturulan alternatif hipotez reddedilemez. Bu hipoteze göre hatalar normal dağılmaktadır (Ek1).

Heteroskedastisite ve otokorelasyonun sınanması panel veri analizinde STATA paket programı kullanılarak gerçekleşmiştir. Beklenildiği gibi değişen varyans ve otokorelasyon hatası reddedilememiştir. Bu hataların düzeltilmesi için Robust modeli tahmin edilmiştir. Tablo 7'de gösterilen bu modelde modern hizmetler dışındaki tüm değişkenler %1 anlamlılık düzeyinde anlamlıdır. Değişkenlere ait parametre katsayıları pozitif işarete sahip olarak teorik beklentileri karşılamıştır.

| Değişkenler | Parametre Değeri | Std. Hata | Olasılık Değerleri |
|---|---|---|---|
| C | 5.881951 | 0.233226 | 0.0000 |
| LOG(GH) | 0.108236 | 0.028651 | 0.0002 |
| LOG(H) | 0.095905 | 0.03393 | 0.0054 |
| LOG(K) | 0.244414 | 0.018977 | 0.0000 |
| LOG(MH) | -0.06356 | 0.042531 | 0.1372 |
| LOG(OP) | 0.073346 | 0.015335 | 0.0000 |

*Tablo 8: PCSE Model Tahmini Robust Modeli*

Havuzlanmış model, sabit etkiler ve tesadüfi etkiler modelleri çalışmada uygulama kapsamına alınarak incelenmiştir. Bu üç model içerisinde Hausmann testi sonucunda, sabit etkiler modelinin etkinliği Kabul edilmiştir. Sabit etkiler modeli çerçevesinde ele alınan analiz içerisinde trend ve zaman etkisinin gözardı edilebileceği kabul edilirken, panel içerisindeki yatay kesitin daha etkin yorumlanabileceği görülmektedir. Otokorelasyonun sınanması için yapılan testler sonucunda (Ek: 2-4) otokorelasyon varsayımında önsezisel

olarak otokorelasyonun varlığından şüphe duyulmuş ve rebust model tahmin edilmiştir. Bu model otokorelasyona karşı farkları da modele dahil ederek dirençli hale gelen ekonometrik bir modellemedir. Dolayısıyla çalışmamızda sabit etkiler modeli ve rebust modeli yapılan testlerle uygulanabilir olarak Kabul edilmiştir. Araştırmacıya bırakılan bu iki model arasında tercih yapma unsuru sonucunda rebust modelin gerek otokorelasyona, gerekse diğer temel ekonometrik varsayımlardan sapmalara karşı daha dirençli olmasından dolayı çalışmada rebust model tercih edilmiştir. Tahmin edilen model aşağıdaki gibidir:

$$\log G = 5,881 + 0,108 \log GH + 0,095 \log H + 0,244 \log K + 0,073 \log OP$$

## 4 Sonuç

Planlı ekonomiden piyasa ekonomisine geçen geçiş ekonomilerinde, 3. Sektör olarak kabul edilen geleneksel hizmetlerin ve 4. Sektör olarak kabul edilen modern hizmetlerin ekonomik büyüme üzerindeki etkisi araştırılmıştır. Küresel dünyaya, planlı ekonomiden geçiş yapan ve ortak özellikleri yakın bir tarihe kadar liberalizasyondan uzak bir ekonomik sistem içinde yer almaları olan geçiş ekonomilerinin, küresel süreç içerisinde aldıkları yolun irdelenmesi açısından önemli bir gösterge mahiyetinde sayılabilecek, hizmet ticaretinin ekonomik büyümeye etkisi, kullanılan veri seti ve seçilmiş 15 ülke açısından anlamlı bulunmuştur.

Literatürde sıklıkla modern hizmet sınıflandırması içinde yer alan hizmet faaliyetlerinin gelişmiş ülke ekonomilerinde ekonomik büyüme açısından itici güç olduğu ön kabulüne, rağmen çoğu gelişmekte olan ülke sınıflandırılmasında yer alan geçiş ekonomileri açısından modern hizmet ticareti ekonomik büyümeyi anılan dönem ve seçilmiş ülke gurubu açısından pozitif etkileyememektedir. Teorik çerçevede beklenildiği üzere geleneksel hizmet ticareti, bu ülke gurubu açısından büyümeyi pozitif etkilerken, katsayısının modern hizmet ticareti katsayısından daha yüksek oluşu da, modern hizmetlerin ekonomik büyüme üzerinde ortaya çıkaracağı yüksek katma değerli çarpan etkisi için, bu ülke gurubunun hala gelişmekte olduğu yönündedir.

Ayrıca sabit etkiler modelinde ticari açıklığın bu ülke grubunda anlamsız çıkması küreselleşme açısından daha bir yarım yüzyıl görmemiş geçiş ekonomilerinin hala küreselleşmenin ekonomik nimetlerinden tam ve etkin olarak yararlanamadığına işaret eder niteliktedir.

Ayrıca beklenildiği üzere okullaşma oranı ve sermaye birikimi ekonomik büyüme üzerinde güçlü ve anlamlı pozitif etkilere sahiptirler. Bu bağlamda geçiş ekonomilerinde ciddi siyasal değişmelere rağmen ekonomik yapılarındaki artan liberalizasyonun etkisiyle, küresel dünyaya adaptasyon açısından ciddi yol kat ettikleri, bunun da ekonomilerinde gözle görülür etkilere yol açtığı görülmektedir.

Yeni dünyanın hızla gelişen sektörü olan hizmet sektörü içerisinde, 1990'lardan sonra yoğun bilişim ve teknolojik altyapı içeren modern hizmetler bu ülke gurubu içinde büyümede önemli görevler üstlenecektir. Bu manada kaynakların bu sektöre, doğru ve hızlı bir şekilde kanalize edilmesi açısında bu ülke gurubu ekonomik birimlerine, ciddi yükümlülükler düşmektedir.

# Orta Asya'da Dış Ticaretin Gelişmesinde Lojistik Hizmetlerinin Rolü

# The Role of Logistics Services in Development of Foreign Trade in Central Asia

Asst. Prof. Dr. Nazım Çatalbaş (Anadolu University, Turkey)

## Abstract

The crucial technical changes in the transport has significantly contributed to the globalization of production and trade. But, in the pure foreign trade theory, transport costs have been ignored, transportation costs are assumed to be zero. With the new approaches, the importance of logistics services in foreign trade has been understood. According to Porter's model, the logistics services are among the main activities and it determines the cost advantage. This study focuses on relationships between logistics services and foreign trade in the Central Asia. Central Asian countries' data were compared with the other countries. Central Asia does not have a direct connection to any sea. Due to lack of territorial access to the sea and therefore remoteness and isolation from world markets causing high transit and transportation costs. While logistics performances are low in the landlocked developing countries, it is high in the developed countries. The low logistics performance increases the costs of foreign trade and cause waste of time in region. For reducing logistics costs in Central Asia, it should be renewed transport infrastructure, constructed alternative networks, harmonised customs and transit regimes in Asian countries and realized other arrangements facilitating the trade. These arrangements for cooperation among countries in the region as well as regional organizations are also required.

## 1  Giriş

Ticaretin (iç ve dış) gelişmesiyle birlikte ticarete konu olan mal ve hizmetlerin tüketiciye ulaşmasında lojistik faaliyetler giderek önem kazanmıştır. Dış ticarete konu olan malları taşıma (nakliye) şekli (tekli yada çoklu model) kadar depolama, elleçleme (*handling*) ve gümrükleme gibi lojistik hizmetlerinin etkinliği ticaret maliyetlerini etkilemektedir. Orta Asya ülkelerinin gelişmiş ülkelerle dış ticaret yapılabilmeleri için en az bir ülkeden transit geçiş yapması gerekmektedir. Bu nedenle transit ülke(ler)deki lojistik altyapı(lar), transit ticaret ve geçiş ücretleri ve ticareti kolaylaştırıcı işlemler de kara ile kaplı (açık denizlere kıyısı olmayan) ülkelerin dış ticaretlerinin önemli belirleyicileri arasında yer alır.

Bu çalışmada kara ile kaplı (*landlocked*) Orta Asya ülkelerinin dış ticaretinde lojistik (taşıma ve diğer lojistik faaliyetler) faaliyetlerin rolü ele alınmıştır. Bu ülkelerde özellikle dış ticarette taşıma ve diğer lojistik maliyetlerin makul düzeylere çekilebilmesi için kısa ve uzun vadede alınacak tedbirler ile uygulanacak politikalar üzerinde durulmuştur.

Çalışmada ele alınan ülkeler; Azerbaycan, Kazakistan, Kırgızistan, Özbekistan, Tacikistan ve Türkmenistan'dan oluşmaktadır. Görüldüğü gibi Güney Kafkasya'da yer alan Azerbaycan da Orta Asya ülkeleri ile birlikte ele alınmıştır. Böyle bir yönteme başvurulmasının ilk sebebi, Azerbaycan kara ile kaplı olmasına karşılık açık denizdeki limanlara nispeten yakın olması ve bunun dış ticarette lojistik maliyetleri ne kadar etkilediğini görmek ikinci sebep ise anlatımda akıcılık sağlamaktır. İlk akıcılık sağlamak ikincisi ise karşılaştırmaları daha dikkat çekici hale getirmektir. Ele alınan ülkeler ilgili bir diğer husus ise Türkmenistan ile ilgili düzenli verilerin bulunamamasıdır. Bu ise söz konusu ülkenin nispeten içe kapalı ve izole olması ile ilgilidir.

## 2  Dış Ticarette Lojistik Hizmetleri

Lojistik hizmetleri denildiğinde akla ilk olarak taşıma (nakliye) faaliyetleri gelse de dış ticarette lojistik hizmetleri pek çok faaliyetten oluşur. Uluslararası ticarette genelde taşıma, stoklama, depolama gibi temel lojistik faaliyetlerinin yanı sıra gümrükleme, elleçleme (handling), satış sonrası servis desteği gibi destek lojistik faaliyetleri büyük role sahiptir. Bu faaliyetlerin etkinliği, yeterliliği ve maliyetleri potansiyel dış ticareti etkilemektedir. Ticari malların iç ve dış piyasalara en kısa süre ve en az maliyet ve istenilen şekilde ulaşmasında lojistik altyapının modern ve yeterli olmasının yanı sıra lojistik sektörünün etkin ve verimli çalışması da önem arz etmektedir. Ticarete konu olan malın bozulmadan dış pazarlara ulaşmasında taşıma gün sayısı ve maliyeti kadar bu süre içinde gümrükte ve diğer depolarda (indirme/bindirme terminallerinde) sağlıklı bir şekilde depolanması ve diğer lojistik hizmetlerin yeterliliği de büyük öneme sahiptir.

Dış ticarette lojistik faaliyetlerin etkinliği, yeterliliği ve maliyetlerini etkileyen temel unsurlar ise dış ticaret yapan ülkeler arasındaki fiziki uzaklık (mesafe), ülkelerin açık denizlere kıyısının olup olmaması, ulaştırma ve

diğer lojistik altyapıların yeterli olup olmaması, gümrük mevzuatlarının şeffaflığı ve yolsuzluğun yaygın olup olmaması şeklinde sıralanabilir.

## 3   Dış Ticaret Teorilerinde Taşıma Maliyetleri

Günümüzde uluslararası ticareti etkileyen temel etmenlerden biri olan taşıma maliyetleri, soyut (pür) dış ticaret teorisinde sıfır olarak varsayılmış ve dış ticareti etkilemediği kabul edilmiştir. Klasik dış teorilerinde sadece üretimdeki uzmanlaşma üzerine odaklanıldığından dış ticareti etkileyen diğer değişkenler ya sabit yada sıfır olarak kabul edilmiştir. Kuruluş yeri teorisinde bölgelerin birbirine uzaklığı ve taşıma maliyetleri gibi unsurların malların fiyatları kadar malların üretilecekleri yerleri belirlediği ifade edilmektedir. Heckscher-Ohlin (H-O) Teorisi'nde bölgelerin doğal özellikleri ve taşıma maliyetleri kuruluş yeri ile ilişkilendirilmiştir (Aydınonat, 2007; Arıcıoğlu, 2011). Benzer şekilde yeni ekonomik coğrafya teorisinde taşıma maliyetleri bir mekanı önemli hale getiren dört temel özellik arasında sayılmaktadır. Bazı neo-klasikler ise taşıma maliyetlerinin dış ticarete etkileri ile ilgili çalışmalar yapmışlarsa da teorik çalışmalarda taşıma maliyetlerinin öneminin anlaşılması daha çok yeni dış ticaret teorileri ile olmuştur.

Klasik dış teorilerinin aksine yeni dış ticaret teorilerinin (ürün devreleri teorisinde) çoğunda karşılaştırmalı üstünlüklerin belirlenmesinde ucuz işgücünün yanı sıra taşıma maliyetlerinin düşüklüğü de önemlidir. P. Krugman'ın tekelci rekabet ile açıkladığı yeni dış ticareti teorisinde endüstri-içi ticaretin ortaya çıkma nedenlerinden birisi de taşıma maliyetleridir. Porter Modeli'nde ana faaliyetlerden biri olan lojistik hizmetleri maliyetleri etkilemekte böylece ülkelerin (firmaların) rekabetçiliğinde önemli role sahiptir. Buna göre düşük lojistik maliyetler uluslararası rekabette ülkeye önemli bir üstünlük sağlamaktadır.

## 4   Bazı Ampirik Çalışmalara göre Dış Ticarette Taşıma Maliyetleri

İlk gruptaki çalışmalar kara ile kaplı ülkelerle denize kıyısı bulunan ülkeler arasında karşılaştırma yapan çalışmalardır. Radelet ve Sachs (1998) taşıma maliyetini temsilen CIF/FOB marjını kullanarak yapmış olduğu çalışmada taşıma maliyetlerinin kara ile kaplı (açık denizlere kıyısı olmayan) ülkelerde %50'den daha fazla olduğunu bulmuşlardır. Radelet ve Sachs (1999) bir başka çalışmalarında nakliye (taşıma) ve sigorta masraflarının denize kıyısı olmayan ülkelerde kıyı ülkelerinden iki kattan daha fazla olduğunu tahmin etmişlerdir (Grigoriou, 2007). Limao ve Venables (1999) ise özellikle kara ile kaplı ülkelerde ticaret maliyetlerine altyapı kalitesinin büyük bir etkisi olduğunu bunun yanı sıra transit geçiş ülkesindeki altyapı kalitesinin de önemli etkisi olduğunu bulmuşlardır. Buna göre kötü (düşük kalitedeki) altyapı denize kıyısı olan ülkelerde öngörülen taşıma maliyetlerine yaklaşık %40 kadar, kara ile kaplı ülkelerde ise %60'dan daha fazlası kadar etkide bulunmaktadır.

Stone (2001) Afrika ile ilgili çalışmasında denize kıyısı olmayan Afrika ülkelerinin denize kıyısı olan Afrika ülkelerine göre %10; gelişmiş ülkelere göre %20'den daha fazla navlun (freight) ödemesi yaptığını belirlemiştir. MacKeallar vd (2002) de denize kıyısı olmayan ülkelerde malların sınırlardan geçişleri ve öncesindeki gümrükleme ve elleçleme süreçlerindeki yüksek işlem maliyetlerinin ithalat fiyatlarını artırdığını ve ihracat gelirlerini azalttığını belirtmektedirler (Arvis vd., 2007). BM Ticaret ve Kalkınma Konferansı'nın (UNCTAD) da ortakları arasında yer aldığı çalışmada ise kara ile kaplı ülkelerde taşıma (nakliye) ve sigorta masrafları, ihracat tutarının yaklaşık %12,9'u iken, bu oran kıyı ülkelerinde %8,1 ve gelişmiş ülkelerde ise %5,8'dir (UNCTAD, 2003). Carrère (2006) panel yerçekimi modeli temelinde, diğer şartlar sabitken, bir kara ülkesinin bir kıyı ülkesinden yaklaşık %28 daha az ticaret yapabildiği sonucuna ulaşmıştır.

İkinci gruptaki çalışmalar taşıma maliyetlerinin ticaret maliyetlerindeki yeri ile ilgilidir. Baier ve Bergstrand (2001) ticaret maliyetlerinde düşüşlerin ticaretin büyümesine katkısının küçük olduğunu bulmuştur (%8). Bu çalışmaya göre ticaretin büyümesinde gelir artışının payı %66, ticaretin kolaylaştırılmasının payı ise %26'dır. Fakat ticaretin kolaylaştırılmasına yönelik pek çok faaliyet ve önlemin lojistik maliyetleri etkilediği de dikkate alınırsa, lojistik maliyetlerin dış ticaretin gelişmesinde önemli bir paya (%34) sahip olduğu görülür. Limao ve Venables (2001) ise 1973-2005 döneminde 21 OECD ülkesinde ihracatta ortalama taşıma maliyetlerinin nominal olarak arttığını, navlun oranlarının kesit varyasyonlarına bakıldığında ise taşıma maliyetlerinde çok önemli düşüş olmadığı sonucunu elde etmiştir (Behar ve Venables, 2010). Jacks vd. (2008) ise ticaretin genişlemesinde taşıma maliyetlerinin içinde yer aldığı ticaret maliyetlerinin payının yaklaşık %30 olduğunu bulmuştur.

Son grupta ise fiziki uzaklık ile dış ticaret arasında bağlantıya yönelik çalışmalar yer almaktadır. Anderson ve van Wincoop (2004) ticaret yapan iki ülke arasındaki fiziki uzaklığa dikkati çekerken, Carrere ve Schiff (2004) de dış ticarette ortalama mesafenin (fiziki uzaklığın) giderek kısaldığını belirtmektedir. Brun vd. (2005) dış ticarette fiziki uzaklık ile dış ticaret işleminin süresi (zamanı) arasında karşılıklı etkileşime vurgu yapmıştır. Disdier ve Head (2008) dış ticaret denkleminde fiziki uzaklık (mesafe) katsayısının 1960'dan 2000'li yıllara kadar arttığını, fiziki uzaklığın giderek dış ticareti daha fazla etkilediği sonucuna ulaşmıştır.

Ampirik çalışmalara bakıldığında kara ile kaplı ülkeler taşımacılık ve lojistik maliyetler açısından dezavantajlı konumda oldukları görülmektedir. Ülkelerin taşıma ve lojistik altyapıları, uluslararası anlaşmalar ve düzenlemeler ile gümrüklerde (cross-border) işbirliği gibi faktörler söz konusu maliyetleri etkilemektedir (Arvis

vd. 2007). Dolayısıyla dış ticaretin yapılabilmesi için sadece üretimde sahip olunan karşılaştırmalı üstünlükler yeterli değildir, lojistik (dar kapsamda taşıma) maliyetleri de dış ticaretteki önemli maliyet unsurları arasındadır. Eğer taşıma (ulaştırma) maliyetlerinin de içinde yer aldığı lojistik maliyetler iki ülke arasında ticaretin yapılmasını engelleyecek kadar yüksek ise, dış ticaret imkanı ortadan kalkar. Kara ile kaplı ülkeler yüksek lojistik maliyetler nedeniyle dış ticarette yapıp yapmama konusunda ciddi ikilem ile karşı karşıyadırlar.

## 5    Orta Asya Ülkelerinde Lojistik Altyapı

Lojistik altyapı taşıma ve diğer lojistik maliyetleri doğrudan etkilediği için önemlidir. Taşıma maliyetlerinin yüksek olduğu ülkelerde ulaşım altyapısının yetersiz olduğunu söylemek yanlış olmayacaktır. Lojistik altyapıyı ele alırken karayolları, demiryolları, boru hatları, haberleşme (telekomünikasyon) gibi ulaşım altyapısının ve gümrük kapılarının (kara ve havayolları ulaşımdaki) gelişmiş ülkelerdeki düzeylere ulaşıp ulaşmadığına bakmak gerekir (Nordas ve Piermartini, 2004). Tablo 1'deki verilere bakıldığında demiryolu yoğunluğu bakımından sadece Azerbaycan ve Özbekistan'ın dünya ortalamasının üstünde olduğu görülmektedir. Ayrıca Orta Asya ülkelerinin verileri Avrupa ortalamasının oldukça altındadır. UNESCAP'ın (*BM Asya ve Pasifik Ekonomik ve Sosyal Komisyonu*) 2013 yılı raporundaki verilere göre bölge ülkelerinde otoban niteliğinde (yüksek standartlı) otoyol bulunmamaktadır. Bununla birlikte Kırgızistan ve Tacikistan'da birinci sınıf yol da yoktur. Söz konusu iki ülkede de yollar düşük kalitededir. Türkmenistan'da ise 60 km birinci sınıf yol olmasına karşılık, ikinci sınıf yol yoktur, karayollarının neredeyse tamamı üçüncü sınıf yollardan oluşmaktadır (Tablo 1). Azerbaycan'da üçüncü sınıf ve daha altındaki kalitede karayolu bulunmakta, karayolunun 280 km birinci sınıf, 1.184 km ise ikinci sınıftır.

| Ülkeler | Demiryolu Yoğunluğu (*1.000 km² alanda demiryolu*) | | | Karayolu Yoğunluğu (*1.000 km² alanda karayolu*) | | | Asfaltlanmış Yol (*Yolların yüzdesi olarak*) | | | Karayolu Uzunluğu (*Sınıflarına Göre[1], 2010*) | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | 1990 | 2000 | 2010 | 1990 | 2000 | 2009 | 2000 | 2005 | 2008 | 1. | 2. | 3. | Toplam |
| Azerbaycan | .. | 25,6 | 25,2 | .. | .. | .. | .. | .. | .. | 280 | 1.184 | 0 | 1.464 |

*(1) 3. sınıfın altında yollar gösterilmemekle birlikte toplam karayolu uzunluğunda bu yollarda yer almaktadır.*

**Tablo 1.** *Bazı Ulaşım Altyapı Göstergeleri* **Kaynak:** *UNESCAP (2013)*

Kazakistan ulaşım sistemi verimlilik (*efficient*) ve maliyet-etkinlik (*cost-effective*) açısından diğer Orta Asya ülkelerine göre daha iyi durumda olsa da gelişmiş ülkelerin oldukça gerisindedir (Kie ve Akhmet 2009). Geniş bir yüzölçümüne sahip ülkenin ulaşım ağlarında altyapı ve kullanılan teknoloji yetersiz ve eskimiştir. Bu ise ekonomik faaliyetlerde taşıma maliyetlerini artırmaktadır. Bir nihai malda taşıma maliyetleri %8 ile %11 arasında iken, bu oranlar sanayileşmiş ülkelerde %4-%4,5'tir. Uluslararası kargolardan istenen teknik ve dokümantasyon şartlarının fazlalığı, bu ülkenin ulaşım ağlarının dünya ile entegrasyonu (bütünleşmesini) sınırlandırmaktadır (Kie ve Akhmet, 2009). 2004-2010 döneminde Kazakistan karayolu ulaşım altyapısını yenileme konusunda ilerlemeler sağlamış (yaklaşık 500 km birinci sınıf,) olsa da istenen düzeye henüz ulaşamamıştır (UNESCAP, 2013).

Coğrafi konumu itibariyle Orta Asya'nın merkezinde bulunan Özbekistan lojistik altyapısını geliştirme, ulaşım ağlarını yaygınlaştırma noktasında ilerlemeler sağlamıştır. 2004-2010 döneminde birinci ve ikinci sınıf karayollarının uzunluğu artarken, üçüncü sınıf ve daha alt kalitedeki kara yollarının uzunluğu ise kısalmıştır. Özbekistan 1.195 km ile diğer beş ülkeden daha uzun birinci sınıf karayoluna sahiptir. Buna karşılık ulaşım standartları, uluslararası standartlara ulaşamamıştır.

Tacikistan Çin, Orta Asya, Güney Asya ve Ortadoğu ülkeleri arasında bir köprü görevi görmektedir. Tacikistan karayolu yoğunluğu diğer bölge ülkelerine göre yüksek olmasına karşılık yol kalitesi oldukça düşüktür. Mevcut karayolu ulaşım ağının yaklaşık yarısı üçüncü sınıfında altında bir kaliteye sahiptir (UNESCAP, 2013). Sonuç olarak Orta Asya ülkeleri dünya pazarlarına ulaşımı yetersiz altyapı ile sağlamaktadır. Bölgenin en önemli ihracat kalemlerinden petrol ve doğalgazın dünya pazarlarına ulaşımı eski ve boru hatları gerçekleştirilse de henüz istenen düzeyde olmayan boru hatları, dış ticaret potansiyelinin tam olarak değerlendirilememesine yol

açmaktadır. Yeni boru hatlarının açılması bölgenin ihracatına ve dünya ekonomisi ile daha fazla entegre olmasına katkı sağlayacaktır.

### 5.1 Orta Asya Ülkelerinin Lojistik Performansları

Dünya Bankası tarafından hesaplanan lojistik performans indeksinde (*LPI: Logistics Performance Index*) en yüksek değer 5, en düşük değer ise 1'dir. Bu değerlerde en iyi performanstan en düşüğe doğru beş parçaya ayrıldığında, Orta Asya ülkelerinin en düşük beşte birlik (1/5) kısım ile dördüncü beşte birlik kısım sınırında yer aldığı görülmektedir. 2014 yılı LPI raporundaki sıralamada (160 ülke arasında) en iyi performansa sahip Orta Asya ülkesi Kazakistan (88'inci) en düşük performansa sahip ülke ise Kırgızistan'dır (149'uncu). 2007-2014 dönemindeki dört rapor bir arada değerlendirildiğinde Kırgızistan'ın LPI değerinin giderek kötüleştiği (2.62'den 2.21'e), Kazakistan'ın ise bölge ülkeleri arasında en yüksek LPI değerine sahip olduğu, Tacikistan'ın LPI değerinin giderek yükseldiği (2012 hariç) söylenebilir. Türkmenistan için tek bir veri mevcut olduğu için karşılaştırma yapılamamıştır.

LPI'yi oluşturan 6 değişkende en yüksek ve en düşük değerlerin ülkelere göre dağılımı şu şekildedir (2014): *Gümrük*te en yüksek değer Azerbaycan'a (2.57) en düşük değer ise Özbekistan'a (1.80); *altyapı*da en yüksek değer Azerbaycan'a (2.71) en düşük değer ise Kırgızistan (2.05) ve Türkmenistan'a (2.06) aittir. Kazakistan *lojistik yeterlilik* (2.72), *takip ve izleme* (2.83) ile *zamanlama*da (3.24) bölgenin en iyi performansa sahip ülkesidir.

| Ülkeler | Yıl | Uluslararası LPI Sıralaması | LPI Skoru | Gümrük | Altyapı | Uluslararası Yük | Lojistik Yeterlilik | Takip ve İzleme | Zamanlama |
|---|---|---|---|---|---|---|---|---|---|
| Azerbaycan | **2014** | **125** | **2,43** | **2,57** | **2,71** | **2,57** | **2,14** | **2,14** | **2,57** |
| | 2012 | 116 | 2,48 | 1,92 | 2,42 | 2,43 | 2,14 | 2,75 | 3,23 |
| | 2010 | 89 | 2,64 | 2,14 | 2,23 | 3,05 | 2,48 | 2,65 | 3,15 |
| | 2007 | 111 | 2,29 | 2,23 | 2,00 | 2,50 | 2,00 | 2,38 | 2,62 |
| Kazakistan | **2014** | **88** | **2,70** | **2,33** | **2,38** | **2,68** | **2,72** | **2,83** | **3,24** |
| | 2012 | 86 | 2,69 | 2,58 | 2,60 | 2,67 | 2,75 | 2,83 | 2,73 |
| | 2010 | 62 | 2,83 | 2,38 | 2,66 | 3,29 | 2,60 | 2,70 | 3,25 |
| | 2007 | 133 | 2,12 | 1,91 | 1,86 | 2,10 | 2,05 | 2,19 | 2,65 |
| Kırgızistan | **2014** | **149** | **2,21** | **2,03** | **2,05** | **2,43** | **2,13** | **2,20** | **2,36** |
| | 2012 | 130 | 2,35 | 2,45 | 2,49 | 2,00 | 2,25 | 2,31 | 2,69 |
| | 2010 | 91 | 2,62 | 2,44 | 2,09 | 3,18 | 2,37 | 2,33 | 3,10 |
| Tacikistan | **2014** | **114** | **2,53** | **2,35** | **2,36** | **2,73** | **2,47** | **2,47** | **2,74** |
| | 2012 | 136 | 2,28 | 2,43 | 2,03 | 2,33 | 2,22 | 2,13 | 2,51 |
| | 2010 | 131 | 2,35 | 1,90 | 2,00 | 2,42 | 2,25 | 2,25 | 3,16 |
| | 2007 | 146 | 1,93 | 1,91 | 2,00 | 2,00 | 1,90 | 1,67 | 2,11 |
| Türkmenistan | **2014** | **140** | **2,30** | **2,30** | **2,06** | **2,56** | **2,07** | **2,32** | **2,45** |
| Özbekistan | **2014** | **129** | **2,39** | **1,80** | **2,01** | **2,23** | **2,37** | **2,87** | **3,08** |
| | 2012 | 117 | 2,46 | 2,25 | 2,25 | 2,38 | 2,39 | 2,53 | 2,96 |
| | 2010 | 68 | 2,79 | 2,20 | 2,54 | 2,79 | 2,50 | 2,96 | 3,72 |
| | 2007 | 129 | 2,16 | 1,94 | 2,00 | 2,07 | 2,15 | 2,08 | 2,73 |
| Almanya | **2014** | **1** | **4,12** | **4,10** | **4,32** | **3,74** | **4,12** | **4,17** | **4,36** |
| Singapur | **2012** | **1** | **4,13** | **4,10** | **4,15** | **3,99** | **4,07** | **4,07** | **4,39** |
| Yüksek Gelirli OECD Ülkeleri | **2012** | | **3,63** | **3,45** | **3,68** | **3,44** | **3,64** | **3,69** | **3,93** |
| Üst-orta Gelirli Ülkeler | **2012** | | **2,84** | **2,57** | **2,72** | **2,83** | **2,77** | **2,87** | **3,27** |
| Alt-orta Gelirli Ülkeler | **2012** | | **2,55** | **2,33** | **2,37** | **2,56** | **2,50** | **2,53** | **3,00** |

***Tablo 2.*** *2007-2014 Döneminde Bazı Ülkelerin Uluslararası Lojistik Performans İndeksi* ***Kaynak:*** *World Bank (2014)*

2010-2014 dönemindeki üç LPI verileri karşılaştırıldığında Azerbaycan'ın 89'dan 117'nciliğe düşüşünü uluslararası gönderi (yük), lojistik yeterlilik, takip ve izleme ile zamanlamadaki olumsuz gelişmeler etkilemiştir. Kazakistan'ın 62'den 88'nciliğe gerilemesinde gümrük, altyapı, uluslararası yük ve zamanlama önemli rol oynamıştır. Kırgızistan'ın 91'den 149'nculuğa inmesinde gümrük, altyapı, uluslararası gönderi, lojistik yeterlilik, takip ve izleme ile zamanlamadaki performans düşüşleri etkili olmuştur. Tacikistan'ın 131'den 114'ncülüğe yükselmesinde belirleyici olanlar gümrük, altyapı, uluslararası gönderi, lojistik yeterlilik, takip ve izlemedeki

değerlerin artmasıdır. Özbekistan'ın 68'nden 129'nculuğa gerilemesinde temel belirleyiciler gümrük, altyapı, uluslararası gönderi (yük), lojistik yeterlilik, takip ve izleme ile zamanlama endekslerindeki değerlerin düşüşleridir.

Orta Asya ülkelerinin kara ile kaplı bir coğrafyada bulunmaları lojistik performansları etkilediği bir gerçek olsa da ülkelerin dış ticaret ve lojistik ile ilgili politikalar bu olumsuz performansta etkilidir. Orta Asya ülkelerinin düşük performansında sadece sahip olduğu coğrafi konumun etkili olmadığını görmek için bu ülkeleri açık denizlere kıyısı olmayan bazı Afrika ülkeleri ile karşılaştırmakta fayda vardır. Orta Asya ülkelerinin tamamı 2012 yılı LPI sıralamasında Burundi, Mali, Zambiya ve diğer denize kıyısı olmayan Afrika ülkelerinin üstünde yer alırken, 2014 yılındaki sıralamada sadece Kazakistan (88) söz konusu Afrika ülkelerinin (*Burundi (107), Mali (119) ve Zambiya'nın (123)*) üstünde yer almıştır. (World Bank, 2012 ve 2014).

## 6    Orta Asya Ülkelerinin Dış Ticaretinde Taşıma Maliyetleri

Orta Asya ülkelerinden Kazakistan, Kırgızistan, Özbekistan ve Tacikistan başkentlerinin en yakın limana uzaklığı yaklaşık 4.000 km'dir. Açık denizlere kıyısı olmayan bu ülkelerin gelişmiş dünya piyasalara ulaşım için uzun mesafelerin kat etmesi gerekmektedir. Bu nedenle Orta Asya ülkelerinin dış ticaret maliyetlerinde taşıma maliyetleri önemli role sahiptir. Dünyada en düşük maliyetle ihracat yapılan ülke olan Malezya (*konteynır başına maliyet 450 dolar*) ile Orta Asya'da en düşük maliyetle ihracat ülke olan Azerbaycan (*konteynır başına maliyet 3.540 dolar*) arasında yaklaşık 7 kat fark vardır (Doing Business, 2013). İhracat maliyeti yüksek gelirli OECD ülkelerinde ortalama 1.070 dolar iken, dünyanın en az gelişmiş ülkelerinin bulunduğu Sahra-altı Afrikası'nda ortalama 2.108 dolardır. Orta Asya'da en düşük maliyetle ihracat yapan ülke 3.540 dolar ile Azerbaycan'dır (en yüksek ülke 8.650 dolar ile Tacikistan). Tablo 3'ten Azerbaycan ve Kazakistan dışındaki ülkelerin ihracat maliyetlerinin yaklaşık %85'lik kısmının yurtiçi nakliye ve taşımaya ait olduğu görülebilir.

İthalat maliyetleri açısından bakıldığında dünyada en düşük maliyet ile ithalat yapan Malezya (*konteynır başına 435 dolar*) ile Orta Asya'da en düşük maliyet ile ithalat yapan Azerbaycan (*konteynır başına 3.560 dolar*) arasında fark yaklaşık 7 kattır (Doing Business, 2013). İthalat maliyetleri yüksek gelirli OECD ülkelerinde 1.090 dolar, Sahra-altı Afrika'sında ise 2.793 dolardır. Dünyanın en yüksek maliyet ile ithalat yapan ülkesi olan Tacikistan (10.250 dolar) ile az gelişmiş Sahra-altı Afrika'sı arasındaki fark, 2,5 kat civarındadır (Doing Business, 2013). Orta Asya'da ithalat maliyetlerinde, ihracatta olduğu gibi, taşıma maliyetleri önemli yer tutmaktadır. Tacikistan'da ithalat maliyetlerinin yaklaşık %87'lik kısmı yurtiçi nakliye ve taşımaya aittir (Tablo 3).

## 7    Orta Asya Dış Ticaretinde Fiziki Uzaklık ve Taşıma Şeklinin Lojistik Maliyetlere Etkisi

Orta Asya dış ticaretinde fiziki uzaklığın yanı sıra çoklu taşıma şekilleriyle (karayolu-demiryolu- denizyolu gibi) nedeniyle yükleme/boşaltma yapılan terminallerin fazlalığı, gümrükleme, fiziki kontrol, depolama, istenen evrak sayısı, altyapı, resmi izinler ve harçlar gibi pek çok faktör, lojistik maliyetleri etkilemektedir. Fiziki mesafenin yaratmış olduğu maliyetlere yüksek transit ücretleri, altyapı eksiklikleri, yolsuzluk ve rüşvet parametreler de eklenince lojistik maliyetler daha da artmakta ve ihracat ve ithalat için ortalama süreler de uzamaktadır. Yukarıdaki etkenlerde dikkate alındığında ülkelerin birbirine yakınlığı ve kolay ulaşılabilir olmaları ile açık denizlere kıyılarının bulunması dış ticareti kolaylaştırmaktadır. Bunların bir sonucu olarak açık denizlere kıyısı olmayan ülkelerin ticareti denize kıyısı olan ülkelerden daha azdır (ortalama %30) (Arvis vd. 2007). Yüksek taşıma maliyetlerinin de etkisiyle uluslararası ticarette ortalama uzaklık giderek kısalmakta ülkeler daha ziyade komşu veya yakın ülkelerle ticarete yönelmektedir.

Uluslararası ticarette en ucuz taşıma şekli, denizyoludur. Orta Asya ile dış ticarette sadece denizyolunun kullanılma şansı oldukça sınırlıdır. Ticarete konu olan malların yapısı (hammadde, nihai ürün, düşük veya yüksek katma değerli ürün) bölge dış ticaretinde taşıma şeklini belirlemektedir. Orta Asya dış ticaretinde petrol ve doğalgaz gibi önemli ihraç kalemlerinin taşıması sadece karadan yapılmaktadır (karayolu, demiryolu ve büyük ölçüde boru hattı ile). En yakın limanlara çoklu taşıma şekli (*karayolu-demiryolu-iç su yolu-karayolu*) ile ulaşan mallar denizyolu uzak pazarlara ulaşmaktadır. Çoklu taşımadaki indirme-bindirme, depolama gibi lojistik faaliyetleri ticaret maliyetlerini artırmaktadır. Fakat Orta Asya dış ticaretinde taşıma maliyetlerinin büyük bir kısmı bu ülkelerdeki taşıma maliyetlerinden kaynaklanmaktadır.

Ticarette taşıma şeklinde önemli bir faktör, ulaşım maliyetleri ve taşınan malların toplam değeri arasındaki ters ilişkidir. Havayolu taşımacılığı zaman açısından önemli bir üstünlüğe sahip olsa da pahalı bir taşıma (ulaşım) şekli olduğu için düşük katma değerli mallar havayolu taşınamamaktadır. Bu ise kara ile kaplı olmanın dezavantajını ortadan kaldırabilecek konumdaki havayolu seçeneğinin göz ardı edilmesine neden olmaktadır. Yüksek ulaşım maliyetleri, ihracatlarının önemli bir kısmı hammaddeye dayanan Orta Asya ülkeleri için ciddi bir sorundur.

### 7.1 Ticaretin Kolaylaştırılması ve Şeffaflığın Lojistik Maliyetlere Etkisi

Dış ticaretin kolaylaştırılması özellikle gümrük işlemlerinin şeffaflığı ve işlemlerin sadeliği, istenen evrakların sayısı, dış ticaret işleminde sürenin uzunluğunu ve maliyetleri etkilemektedir. Orta Asya ülkelerinde dış ticaret işlemi yapmak için gerekli evrak sayısı gelişmiş ülkelerden oldukça fazladır. İhracat için Fransa'da 2 evrak yeterli iken (*yüksek gelirli OECD üyelerinde 4 ve Sahra-altı Afrika'sında ise ortalama 8*) Orta Asya ülkelerinin çoğunda 10'dan fazla evrak istenmektedir. İthalat için en fazla evrak Özbekistan'da istenmektedir (14 adet belge). Orta Asya ülkeleri dış ticaret açısından coğrafyanın yaratmış olduğu engellere başka engeller ekleyerek dış ticareti daha zorlaştırmakta ve maliyetli hale getirmektedirler.

Orta Asya ülkelerinin açık denizlere kıyılarının bulunmaması ve diğer engeller dış ticarette hem süreyi hem de maliyetleri ciddi oranda etkilemektedir. Orta Asya ülkeleri için şeffaflık ciddi bir sorun olduğu için dış ticareti de etkilemektedir. Dış ticarette istenen evrak sayısı ve dış ticaret işlemlerinin tamamlanma süresi sanayileşmiş ülkelerle karşılaştırıldığında olumsuz bir tablo ortaya çıkmaktadır. Uluslararası Şeffaflık Örgütü'nün yayınlamış olduğu Yolsuzluk Algılama Endeksi'nde Orta Asya ülkelerinin verileri şeffaflığın az, yolsuzluğun ise yaygın olduğunu göstermektedir. 177 ülke arasında üstten alta doğru Azerbaycan (127), Kazakistan (141), Kırgızistan (151), Tacikistan (156), Türkmenistan (169) ve Özbekistan (170) şeklinde sıralanmaktadır (Transparency International, 2013). Bu olumsuz tablo lojistik faaliyetlerin her aşamasında ciddi sıkıntılara yol açmaktadır.

### 7.2 Orta Asya Dış Ticaret İşlemlerinde Sürenin Maliyetlere Etkisi

Dünyada uluslararası ticaret işlemlerin çok kısa sürede gerçekleştiği ülkeler genelde açık denizlere kıyısı olan ve liberal dış ticaret politikaları izleyen ülkelerdir. 2013 verilerine göre Danimarka, Estonya, Hong Kong ve Singapur gibi ülkelerde ihracat ortalama 6 günde gerçekleşirken (*yüksek gelirli OECD ülkeleri ve Sahra Altı Afrika'sı ortalamaları 11 ve 31 gün*), Azerbaycan'da ihracat için ortalama 28 gün gereklidir (Doing Business, 2013). Orta Asya'da geniş bir coğrafyaya sahip olan Kazakistan'da ihracat için gerekli ortalama süre 2,5 aydan fazladır (81 gün). Danimarka'da ihracat ile ilgili bütün süreçler 6 günde tamamlanırken (Business Doing, 2013), Özbekistan ihracatında gümrükleme ve teknik kontrol için 5, yurt içi nakliye ve taşıma için 45 gün gerekmektedir (Tablo 3).

Azerbaycan'da ihracat için toplam 28 günlük sürenin yaklaşık yarısı (15 gün) gerekli evrakların tamamlanmasında, toplam sürenin dörtte biri ise nakliye ve taşıma işlemlerinde geçmektedir. Özbekistan'da evrakların hazırlanması yaklaşık bir aydır. Belgelerin fazlalığı ve bekleme süreleri de dikkate alındığında Orta Asya ülkelerinde ciddi bir bürokrasi mevcudiyetinden söz edilebilir. İhracatın en uzun süre aldığı ülke ise Kazakistan'dır (81 gün). Bu ülkede toplam sürenin yarıdan daha fazlası (46 gün) yurt içi nakliye ve taşıma faaliyetleri ile ilgilidir. Nakliye ve taşıma işlemlerinde süre uzadıkça maliyetlerde artmaktadır. Bu ise 4.885 dolarlık ihracat maliyetinin 3.800 dolarlık kısmına eşittir. Ülke coğrafyasının genişliği, açık denizlere en uzaklık ve altyapının yetersizliği, bu durumun başlıca nedenidir.

| | Azerbaycan | | Kazakistan | | Kırgızistan | | Özbekistan | | Tacikistan | |

***Tablo 3.*** *Dış Ticaret İşlemlerinde Süre ve Maliyetler* **Kaynak:** *Doing Business (2013)*

Dünyada ithalatın ortalama olarak en kısa sürede gerçekleştiği ülke, 4 gün ile Singapur'dur (*yüksek gelirli OECD ülkeleri ve Sahra Altı Afrika'sı ortalamaları 10 ve 38 gün*) (Doing Business, 2013). Orta Asya'ya bakıldığında ithalat için en uzun süre, 95 gün ile Özbekistan'a (*dış ticarette sıkı devlet kontrolü mevcut ve yoğun ithal ikameci sanayileşme uygulanmakta*) aittir. Azerbaycan diğer bölge ülkelerine göre açık denizlere daha yakın ayrıca dış ticarette istenen evrak sayısı ve bunun için gerekli olan süre daha az olduğu için ithalat için ortalama süre 25 gündür. Buna karşılık Kırgızistan'da ihracat için gerekli evrakların hazırlanması 25 gündür.

Orta Asya ülkelerinde önceki yıllarla karşılaştırıldığında ticaretin kolaylaştırılmasına yönelik önlemlerin yanı sıra altyapıların yenilenmesi ve yeni teknolojilerin daha fazla kullanımı ile birlikte dış ticaret işlemlerinin tamamlanması için gerekli olan ortalama süre azalmakla birlikte mevcut süreler de oldukça uzundur. Dış ticaret için gerekli evrakların sayıca fazlalığı ve bunların tamamlanması ile sürenin uzunluğu ciddi bir olumsuzluktur.

## 8  Ulaşım Altyapısını Geliştirmeye Yönelik Projeler ve Bölgesel İşbirliği

Sovyetler Birliği'nin dağılmasının ardından 1990'lı yıllarda Orta Asya ülkeleri yetersiz ulaşım altyapısı nedeniyle nispeten yakın bölgesel piyasalardan bile izole idi. Sovyet döneminin ardından Orta Asya ülkeleri hem yakın bölgelerle hem de dünya her alanda ilişkilerini artırmak istemiştir. Bölgede bulunan önemli enerji kaynakları (petrol), madenler ve sanayi açısından önemli tarım ürünleri (pamuk gibi) Orta Asya ülkelerinin dünya ekonomisi ile entegre olmasını (bütünleşmesini) daha cazip hale getirmiştir. Bölgenin dünya pazarları ile bütünleştirilmesinde en önemli sorunlarda birisi de yetersiz ulaşım altyapısıdır.

Kara ile kaplı bir coğrafyada yer almak bir ülke için önemli bir dezavantaj yaratsa da alınacak tedbirler olumsuzluğu azaltabilmektedir. Açık denizlere kıyısı olmayan Orta Asya ülkeleri ile Orta Avrupa ülkeleri karşılaştırıldığında Orta Asya ülkelerinin coğrafi, ekonomik ve kurumsal konularda engelleri artırırken, Orta Avrupa ülkelerinin coğrafi, ekonomik ve kurumsal alandaki güçlerini birleştirdikleri görülmektedir (Raballand, 2003, 521). Ülkelerin kendi ulusal çabaları ile ulaşım altyapılarını modernleştirme ve dünya ile entegre etme çabasının etkileri sınırlıdır. Bu ülkelerde ulaşımla ilgili projeler hem maliyetli hem de birden fazla ülkeyi ilgilendirdiği için plan, proje, finansman ve uygulama noktasında uluslararası bir koordinasyonu gerekli kılmaktadır.
